for the preference to be given to them on other grounds, t
to all save very special kinds of microscopic work.

5. "Resolving power," being that by which very min
closely approximated markings whether lines, strie, o
apertures—can be separately discerned, is a function which
primary importance in objectives whose amplifying power s
fits them for the study of objects of this class. It appears f
mathematical researches of Professor Abbe that the m
resolving power (with a theoretical angle of 180°) would be
of separating 146,528 lines to the inch; but he considers th
of visual resolution depending on the power of the eye to
$\frac{1}{113,000}$ of an inch; and this limit seems to have been
reached. To make such a separation distinctly percept
amplification of at least 3000 linear would be requisite; a
can only be obtained either by the use of an objective of ve
power (such as $\frac{1}{12}$ inch focus) in combination with a low or
eye-piece or by putting a very deep eye-piece upon an obje
lower power (such as a 1 inch), the former method, for the
already given, being decidedly preferable. For the resolutio
closely approximated markings objectives of $\frac{1}{25}$, $\frac{1}{50}$, $\frac{1}{75}$
inch answer very well; and the resolving power whi
require may be obtained without any excessive widenin
aperture. For e loss of resolving power consequent u
contraction the angle of a water-immersion objective to
only one-tenth of the theoretical maximum 128,212; while
tion to 105° only lowers the number of separable lines to
to the inch,—thus diminishing the resolving power by litt
than one-fifth, while the working distance and focal depth
combination are greatly increased, and perfect definition
certainly attainable. The $\frac{1}{8}$ inch is (according to the
experience, which is confirmed by the theoretical deduc
Professor Abbe) the lowest objective in which resolving
should be made the primary qualification,—the $\frac{1}{8}$, $\frac{1}{6}$, $\frac{1}{4}$,
inch being specially suited to kinds of biological work i
this is far less important than focal depth and dioptric p
This view is strengthened by the very important considerat
the resolving power given by wide aperture cannot be
except by a method of illumination that causes light to pass

---

[1] for work of this kind, the shallower eye-pieces and longer tubes of microscopes are to be preferred to the deeper eye-pieces and shorter tubes dinary Continental model, the shallowest eye-pieces of the latter being qual in power to the ordinary B eye-pieces of the former.

ct at an obliquity corresponding to that at which the most t rays enter the objective. Now, although in the case of whose markings are only superficial such obliquity may not nctive of false appearances (though even this is scarcely con-), it must have that effect when the object is thick enough an internal structure; and the experience of all biological s who have carried out the most delicate and difficult ations is in accord, not only as to the advantage of direct ation, but as to the deceptiveness of the appearances given ue, and the consequent danger of error in any inferences om the latter. Thus, for example, the admirable researches sburger, Fleming, Klein, and others upon the changes which ace in cell nuclei during their subdivision can only be l and verified (as the writer can personally testify) by ation of these objects under axial illumination, with objec- an angle so moderate as to possess focal depth enough to he wonderful differentiation of component parts brought out ing processes through their whole thickness.

nost perfect objectives for the ordinary purposes of scientific , therefore, will be obviously those which combine exact n and flatness of field with the widest aperture that can be ithout an inconvenient reduction of working distance and he degree of focal depth suitable to the work on which they ectively to be employed. These last attributes are especially n the study of living and moving objects; and, in the case , dry objectives are decidedly preferable to immersion, e shifting of the slide which is requisite to enable the move the object to be followed is very apt to produce disarrange- the interposed drop. And, owing to the solvent power which ntial oils employed for homogeneous immersion have for nary cements and varnishes, such care is necessary in the objectives constructed to work with them as can only be hen the observer desires to make a very minute and critical ation of a securely-mounted object.

ollowing table expresses the magnifying powers of objectives ted on the English scale of inches and parts of an inch, with nch body and the A and B eye-pieces usually supplied by makers, and also specifies the angle of aperture which, in the judgment, is most suitable for each. He has the satisfac finding that his opinions on this latter point, which are long experience in the microscopic study of a wider range al and vegetable objects than has fallen within the purview of his contemporaries, are in accordance with the conclu awn by Professor Abbe from his profound investigations into ory of microscopic vision,[1] which have been carried into l accomplishment in the excellent productions of Mr Zeiss.

ordinary biological work, the ⅔, 1/10, and 1/12 objectives, with of from 100° to 120°, will be found to answer extremely constructed on the water-immersion system.

of these powers should be tested upon objects most suited mine its capacity for the particular kind of work on which it employed, and, in such testing, the application of deeper eye- than can be habitually employed with advantage will often bring out marked differences between two objectives which work almost equally well under those ordinarily used,- in definition or colour correction, and want of light, which otherwise have escaped notice, being thus made apparent. gle object is of such general utility for these purposes as a ell marked *Podura*-scale; for the eye which has been trained se of a particular specimen of it will soon learn to recognize means the qualities of any objective between 1 inch and ⅛ cus; and it may be safely asserted that the objective which early and sharply exhibits its characteristic markings is the the ordinary work of the histologist.

he special attribute of resolving power, on the other hand, an entirely different order are required; and these are fur- as already stated, either by the more "difficult" diatoms, the highest numbers of Nobert's ruled test plate. The valve at present most in use as a test for resolving s the *Amphipleura pellucida*, the lines on which were long d to be more closely approximated than those of Nobert's nineteenth band, being affirmed by Mr Sollitt to range fro to 130 in 1/10000 of an inch. But the admirable photograp this valve obtained by Colonel Dr Woodward have confirme conclusion long previously expressed by the writer, that thi mate was far too high, being based on the "spurious line produced by diffraction, and show that the striæ on the valves do not exceed 91, while those on the smallest are neve numerous than 100, in 1/10000 of an inch. The same adm manipulator has also obtained excellent photographs of anothe difficult test-diatom, *Surirella gemma*, from which it a that its transverse striæ count longitudinally at the rate of to the inch, whilst the beaded appearances into which thes be resolved count transversely at the rate of 84,000 to the Thus it appears that the complete resolution of these "vexa diatoms does not require by any means the maximum of ap but is probably dependent at least as much on the perfection corrections and the effectiveness of the illumination.

It must be understood that there is no intention in these re to undervalue the efforts which have been perseveringly ma the ablest constructors of microscopic objectives in the direc enlargement of aperture. For these efforts, besides increasi resolving power of the instrument, have done the great ser producing a vast improvement in the quality of those object moderate aperture which are most valuable to the scientific gist; and the microscopist who wishes his *armamentum* to b plete will provide himself with objectives of those different qu as well as different powers, which shall best suit his par requirements.[2]

Illuminating Apparatus.

Every improvement in the optical performance of the com achromatic microscope has called forth a corresponding im ment in the illumination of the objects viewed by it, since came to be apparent that without such improvement the f vantage of the increased defining and resolving powers objectives could not be obtained. For the illumination of parent objects examined by light transmitted through them low powers of moderate angle a converging pencil of rays re upon their under surface by a concave mirror is generally suffic a "condenser" being only needed when the imperfect transp of the object requires the transmission of more light throu And the microscopist engaged in ordinary biological studie works on very transparent objects with objectives of ½ or focus, or 1/5 inch immersion, will find that the small c mirror of short focus with which the Continental models a nished (see fig. 28) will generally prove sufficient for his needs mirror is usually hung at such a distance beneath the stag parallel rays falling on it are brought to a focus in the obje lies on a slip of glass resting on the stage; and thus, wh nstrument is used by day, the light of a bright cloud (which erable to any other) gives a well-illuminated field, even wi powers last-mentioned. But when lamplight is used its div rays are not brought to a focus in the object by a mirror fixed as just stated; and the distance of the mirror beneat stage should be made capable of increase (which is easily d attaching it to a lengthening bar), so as to obtain the re focal convergence. Still the best effects of objectives of le ⅓ inch focus cannot be secured without the aid of an achr condenser, interposed between the mirror and the object, s bring a larger body of rays to a more exact convergence.

When objectives of still higher power are employed, the e ment of such a condenser becomes indispensable; and wh highest powers are being used by lamplight, it is desirable pense with the mirror altogether, and to place the flame exa the optic axis of the microscope. The condenser should achromatic combination, corrected for the ordinary thick the glass slip on which the object lies, and capable of b adjusted as to focus the illuminating pencil in the object.

As it is often found desirable that an object should be illum by central rays alone, or that the quantity of light trans through it should be reduced (for bringing into view delicate of structure which are invisible when the object is floode light), every microscope should be provided with some m cutting off the outer rays of the illuminating cone. The phragm plate" ordinarily used for this purpose is a disk o metal, pivoted to the under side of the stage, and perforated graduated series of apertures of different diameters, any one o can be brought, by the rotation of the disk, exactly into th axis of the microscope. But the required effect can be muc advantageously obtained by the "iris-diaphragm," in w number of converging plates of metal are made so to sli each other by the motion of a lever or screw that th ture is either enlarged or diminished, while always remainin tically circular as well as central; and in this manner a con

[1] See paper on "The Relation of Aperture and Power in the Microscope," in *Trans. Micros. Soc.*, 1882, pp. 300, 460.

the object is obtained, with a gradational modification of the
Another method, commonly adopted in German microscopes,
ace a draw-tube in the optic axis between the stage and the
and to drop into the top of this tube one of a set of "stops"
ted with apertures of different sizes; this allows a gra-
l effect to be obtained by raising or lowering the tube, so as
the stop nearer to or more remote from the object; but it
nearly so convenient as the iris-diaphragm; and the effect of
p is not nearly so good when it is removed to some dis-
eneath the object as when it is very near to the under sur-
the glass object-slide. When an achromatic condenser is
ther a diaphragm-plate or an iris-diaphragm should be placed
ts back lens, so as to cut off any required proportion of the
ays that form its illuminating cone.

an arrangement, while suiting all the ordinary requirements
microscopist who uses the highest powers of his instrument
purposes of biological investigation (as, for example, in the
f *Bacteria* or of the reproduction of the *Monadina*), does not
bring into effective use the special resolving power pos-
by objectives of large aperture. It has long been known
r the discernment of very closely approximated markings
illumination is advantageous,—an objective which exhibits
diatom-valve as *Pleurosigma angulatum* with a smooth un
surface when illuminated by the central rays of the achro-
condenser making its characteristic markings (figs. 8-11)
tly visible when the central rays of the condenser are kept
a stop, and the object is illuminated by its convergent mar
ays only. And it has also been practically known for some
hat the resolution of lined or dotted tests can be often
by mirror illumination alone, if the mirror be so mounted
able to reflect rays through the object at such obliquity to
ic axis of the microscope as to reach the margin of a wide-
objective. But it has only been since Professor Abbe's
hes have given the true theory of "resolution" that the
advantage of oblique illumination has been fully compre-
, and that the best means have been devised for using it
ely. Two different systems have now come into use, each
h has its special advantages.

consists in the attachment of the illuminating apparatus
and achromatic condenser) to a "swinging tail-piece" (see
, which, moving radially upon a pivot whose axis intersects
ic axis at right angles in the plane of the object, can trans-
illuminating pencil through it at any degree of obliquity
he construction of the stage allows. The direction of this
being of course limited to one azimuth, it is requisite, in order
g out its full resolving effect, that the object should be made
te, by making the stage that carries it revolve round the
xis, so that the oblique pencil may impinge upon the lines or
markings of the object in every direction successively. It
en be found that the appearances presented by the same
often vary considerably,—one set of lines being shown when
ect lies in one azimuth, and another when its azimuth has
hanged by rotation through 60°, 90°, or some other angle.
s contrivances have also been devised for throwing very
illuminating pencils on the object by means of prisms
beneath the stage.

nination of at least equal obliquity to that afforded by the
ng tail-piece may now, however, be obtained by the use of
sers specially constructed to give a divergence of 170° to the
hich they transmit when used immersionally, by bringing
lat tops into approximation to the under side of the glass
n which the object is mounted, with the interposition
m of water or (preferably) of glycerin. By using a central
marginal rays alone may be allowed to pass; and these will
nsmitted through the object in every azimuth at the same
But diaphragms with apertures limiting the transmitted rays
part of the periphery may be so fixed in a tube beneath
ndenser as to be easily made to rotate, thus sending its
e pencils through the object in every azimuth in succession.
here this rotation of the diaphragm brings out two sets of
t a certain angular interval a diaphragm with two marginal
gs at a corresponding angular distance will enable both to
at once. Numerous arrangements of this kind have been
by those who devote their special attention to the reso-
of difficult diatom-tests; but they are of little or no use to
who use the microscope for biological research.

the illumination of the surfaces of opaque objects which must
by reflected light the means employed will vary with the
ength of the objective employed. For large bright objects
under a low magnifying power good ordinary daylight is
nt; but if the surface of the object is dull, reflecting but
light, the aid of a bull's-eye or large bi-convex lens must be
ysed in order to give it sufficient brilliance. This aid will
be required by lamplight; and by a proper adjustment of
lative distances of the lamp and the object the rays from the
may be made either to spread themselves over a wide area or
[illegible] a small spot. The former is the method suitable

to large objects viewed under a low magnifying power; th
to the illumination of small objects which are to be examine
objectives of (say) 1 inch or ½ inch focus. Another metho
may be conveniently had recourse to when the microscope
vided with a swinging tail-piece is to turn this on its piv
the concave mirror is brought above the stage, so that ray
it gathers either from natural or artificial sources may be
downwards upon the surface of the object.

The illumination of an opaque object to be seen with
power than the ⅔ or ½ inch objectives was formerly provi
by a concave speculum (termed a Lieberkuhn after its invento
a perforation in the centre for the passage of the rays to th
tive to which it is fitted,—the curvature of the speculum
adapted to the focus of the objective which carries it tha
the latter is duly adjusted, the rays reflected upwards around the object from the mirror to the speculum shall converge strongly on the ob ject. The various disadvantages of this mode of illumination, however, have caused it to be now generally superseded by other arrangements. For powers between 1½ inch and ⅛ inch, and even for a ¼ or ⅙ inch of small angle and good working distance, nothing is so convenient as the parabolic speculum or side illuminator (F, fig. 17) invented by the late Richard Beck. This is attached to a spring clip that slides on the tubes of low power objec tives, so that its distance from object and the direction of its re flected pencil are readily adjusted; and for use with higher powers it may be either mounted on a separ ate arm attached to some part of the stand of the micros may be hung in the manner shown in fig. 17 from an "a A interposed between the objective and the body. By the collar B and making use of the joints C, C, the leng rod D, and the ball and socket E, any position may be give speculum F that may best suit the objective with which it

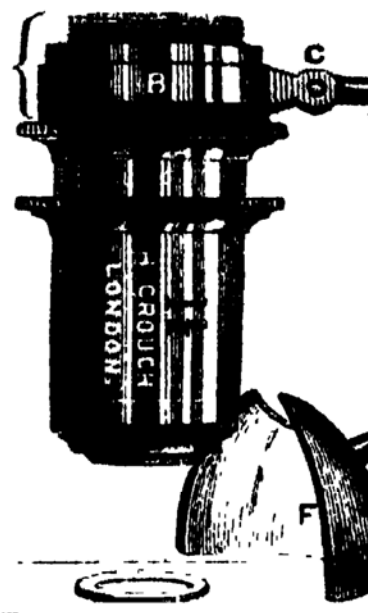

FIG. 17.—Beck's Parabo Illuminator, with Adapter.

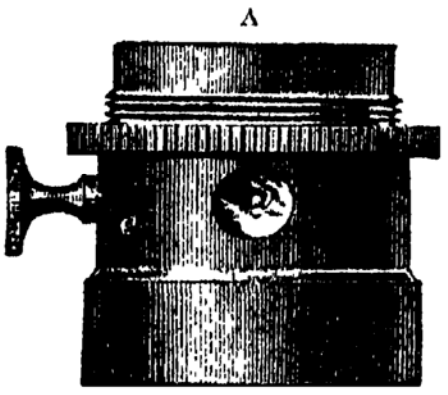
When, however, it is desired to illuminate objects to be se objectives of high power and very short working distan illumination of any kind becomes difficult, though not al impossible;[1] and various modes have been devised for the i tion of the object by means of light sent down upon it, the objective, from above. This is done in the vertical illu of Messrs Beck (fig. 18) the original idea of which



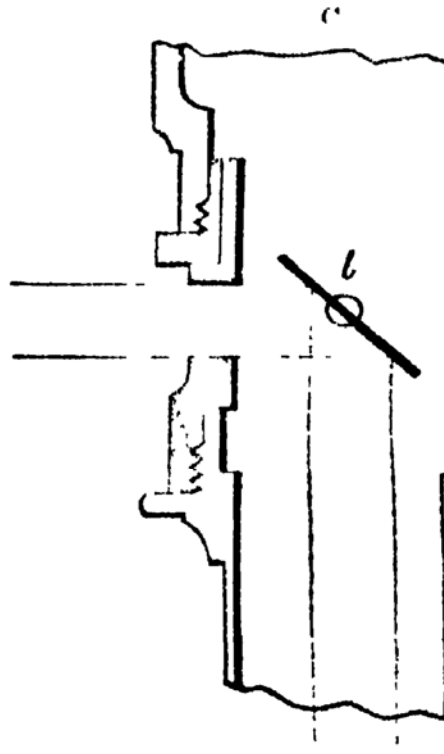


FIG. 18.—Beck's Vertical Illuminator.

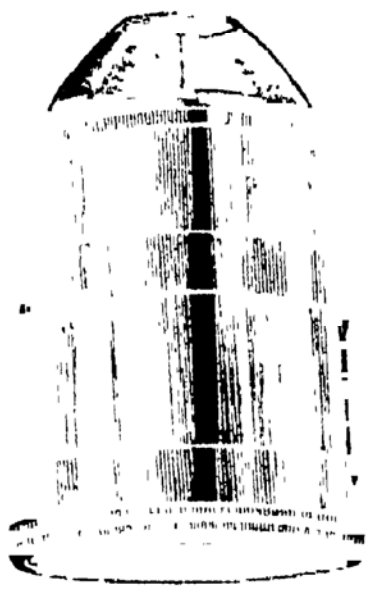
given by the American Professor H. L. Smith—by a thin glass B, *b*, attached to a milled head by which its position may be adjusted, and introduced by a slot A, *c* interior of an adapter that is interposed between the objec and the nose *c* of the body. The light which enters at th aperture A, *a*, falling upon the oblique surface of the dis reflected downwards, and is concentrated by the lense objective upon the object beneath. The lateral apertur provided with a diaphragm, with openings of different diminishing the false light to which this method is liable; o with a small aperture may be placed between the lamp

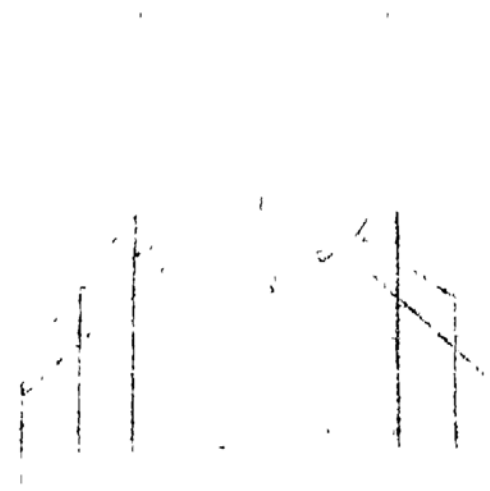
[1] See a method devised by Mr James Smith, in *Jour. Roy. Micros. So* N. S., 1880, p. 398.

tor, at any distance that is found to produce the best effects. this illuminator, the lamp should be placed at a distance 8 inches from the aperture; and, when the proper adjustave been made, the image of the flame should be seen upon ct. The illumination of the entire field, or the direction of t more or less to either side of it, can easily be managed by rposition of a small condensing lens placed at about the dis- its own focus from the lamp. The objects viewed by this illumination with dry-front objectives are best uncovered, they are covered with thin glass, so large a proportion of t sent down upon them is reflected from the cover (especially jectives of large angle of aperture are employed) that very seen of the objects beneath, unless their reflective power is gh. With immersion objectives, however, covered objects used. Another method of vertical illumination long since by Mr Tolles has recently been brought into notice by r W A Rogers of Boston (U. S.). It consists in the inon of a small rectangular prism at a short distance behind t combination of the objective, so that parallel rays entervertical surface pass on between its parallel horizontal surntil they meet the inclined surface, by which they are downwards. In passing through the front combination of ective, they are deflected towards its axis; but, as their convergence is less than the angle of divergence of the rays ng from the object, the reflected rays will not meet in the nt of the lens, but will be so distributed as to illuminate ent area. By altering the extent to which the prism is n, or by lifting or depressing its outer end by means of a ead screw, the field of illumination can be regulated. The of this prism with immersion-objectives is stated by Mr be peculiarly satisfactory.

Ground Illumination.—There are certain classes of objects hough sufficiently transparent to be seen with light transhrough them, are best viewed when illuminated by rays of quity as not to pass directly into the objective, such a on of these rays being retained by the object as to render it nous, when, all direct light being cut off, the general field tly dark. This method is particularly effective in the case delicate mineral structures as the siliceous tests of *Poly* nd the "frustules" of *Diatomaceæ*. And it is one ad- of this kind of illumination that it brings out with able effect the solid forms of objects suited to it, even ey are viewed monocularly. Two modes of providing this tion are in use, each of which has its special advantages. sists in placing a central stop either upon or immediately a condenser of wide aperture, which shall cut off all rays se that, after passing through the object (as in fig. 20), at an angle greater than that of the objective used; so nle the ground is darkened, the object is seen brightly out upon it. But if the divergence of the rays is but (say 60°), and the angle of the objective is large (say most divergent rays of the condenser will enter the marrtion of the objective, and, the field not being darkened, k-ground effect will not be produced. This method great convenience of allowing black-ground illumination bstituted for the ordinary illumination under different without any other change in the apparatus than the turning hragm plate fitted with stops of different sizes suitable to ral apertures of the objectives; and the modern achrondensers of wide aperture can be thus used with objectives ngle.

cellent black ground illumination is also given by the paraminator (fig. 19), originally worked out as a silvered n by Mr Wenham, but now made as a paraboloid of glass ects to its focus the rays which fall upon its internal surface. minate section of this instrument, showing the course of through it, is given in fig. 20, the shaded portion repre- the paraboloid. The parallel rays r, r', r'', entering its lower perpendicularly, pass on until they meet its parabolic on which they fall at such an angle as to be totally reflected nd are all directed towards its focus F. The top of the oid being ground out into a spherical curve of which F is re, the rays in emerging from it undergo no refraction, since ls perpendicularly upon the part of the surface through t passes. A stop placed at S prevents any of the rays l upwards by the mirror from passing to the object, which, laced at F, is illuminated by the rays reflected into it from s of the paraboloid. Those rays which pass through it again at various angles; and if the least of these, GFH, be than the angle of aperture of the object glass, none of them r it. The stop is attached to a stem of wire, which passes ly through the paraboloid and terminates in a knob beneath, n in fig. 19; and by means of this it may be pushed , so as to cut off the less divergent rays in their passage the object, thus giving a black-ground illumination with s of an angle of aperture much wider than GFH. In using boloid for delicate objects, the rays which are made to enter it should be parallel; consequently the plane mirror should be employed; and when, instead of the parallel rays of dayli are obliged to use the diverging rays of a lamp, these sh rendered as parallel as possible, previously to their reflexio the mirror, by the interposition of the "bull's-eye" so adjusted as to produce this effect. There are many cases, however,





FIGS. 19, 20.—Wenham's Parabolic Illuminator.

in which the stronger light of the concave mirror is pre When it is desired that the light should fall on the object f side only, the circular opening at the bottom of the wide tu carries the paraboloid may be fitted with a diaphragm ad cover all but a certain portion of it; and, by giving rot this diaphragm, rays of great obliquity may be made to fa the object from every azimuth in succession.

In order to adapt this paraboloid to objectives of very wi of aperture, a special modification of it, originally devised Wenham, has been latterly reintroduced under the design "immersion paraboloid," with most excellent effect. This in making the top of the paraboloid flat instead of concave interposing a film of glycerin between its surface and th surface of the glass slide carrying the object. Only rays extreme obliquity are allowed to pass into the slide as w totally reflected from its under surface if they fell upon it air; and, as these illuminate the object without passing objective, it can be thus examined under even the highest

Binocular Microscopes.

Stereoscopic Binoculars.—The admirable invention of the scope by Professor Wheatstone has led to a general a tion of the value of the conjoint use of both eyes, in conve the mind a conception of the solid forms of objects such use of either eye singly does not generate with the like cert effectiveness (see STEREOSCOPE). This conception is the of the mental combination of the dissimilar perspective pro which our right and left retinæ receive of any object that ciently near the eyes for the formation of two images that sibly dissimilar. Now it is obvious that a similar differen exist between the two perspective projections of any object that are formed by the right and left halves of a microsc jective and that this difference must increase with the aperture of the objective. And the fact of this difference easily made apparent experimentally, by adapting a sem "stop" to any objective of from 20° to 30° angle in such a that it can be turned so as to cover either its right or its l for not only will the two images of any projecting object fo the rays transmitted through the two uncovered halves b sensibly different, but, if they be photographed or accurately the "pairing" of their pictures in the stereoscope will br the form of the object in vivid relief. What is needed, ther give the true stereoscopic effect to a binocular microscope is of so bisecting the cone of rays transmitted by the object its two lateral halves shall be transmitted the one to the r the other to the left eye, and that the two images shall be (the image formed by the right half of the objective being se left eye, and that formed by the left half of the objective be to the right eye) in order to neutralize the reversing effec microscope itself. If this crossing does not take place, t will be rendered "pseudoscopic," not "orthoscopic,"—it tions becoming depressions, and its depressions being broug prominences. It was from a want of due appreciation of that the earlier attempts at constructing a stereoscopic b gave representations of objects placed under it, not in th orthoscopic, but in their pseudoscopic aspect. This case, for example, with the binocular microscope first de

Professor Riddell of New Orleans in 1851, which separated the cone of rays by a pair of rectangular prisms so placed edge to edge above the objective that the rays passing through its right half were reflected horizontally to the right side, to be changed to the vertical direction and sent to the right eye by a lateral rectangular prism, while the rays from the left half of the objective were sent to the left eye in a similar manner. Professor Riddell describes the "conversion of relief" produced by this arrangement with the ordinary eye-piece as making a metal spherule appear "as a glass ball silvered on the under side, and a crystal of galena like an empty box." And to render the images "normal and natural" he found himself obliged to use erecting eye-pieces, which should produce a second reversal of the images that had been reversed in their first formation.[1] Subsequently, however, Professor Riddell devised and perfected another arrangement giving a true orthoscopic effect, which, after being long disregarded, has been latterly taken up and brought into use by Mr Stephenson. The cone of rays passing upwards from the objective meets a pair of prisms (A, A fig. 21) fixed immediately above its back lens, which divides it into two halves; each of these is subjected to internal reflexion from the inner side of the prism through which it passes; and the slight separation of the two prisms at their upper end gives to the two pencils B,B, on their emergence from the upper surfaces of the prisms, a divergence which directs them through two obliquely-placed bodies to their respective eye pieces. By this internal reflexion a lateral reversal is produced, which neutralizes that of the ordinary microscopic image, so that, while each eye receives the image formed by its own half of the objective, the pairing of the two pictures produces a true orthoscopic effect.[2]

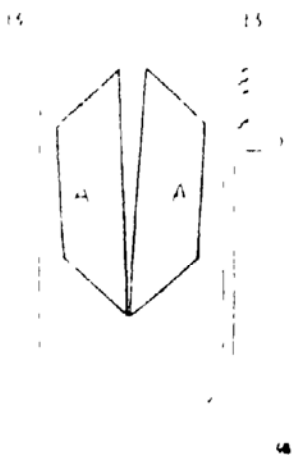


Fig. 21.—Riddell's Binocular Prism.

About the same date MM. Nachet of Paris succeeded in devising a binocular that should give a true orthoscopic image, by placing above the object-glass an equiangular prism (P, fig. 22) with one of its surfaces parallel to its back lens, which, receiving the pencils *ab* forming the right half of the cone, internally reflects them obliquely upwards to the left, and in like manner reflects the pencils *a'b'* from the left half of the cone obliquely upwards to the right. These pencils, passing out of the left and right oblique faces of the prism at right angles (so as not to undergo either refraction or dispersion), enter right and left lateral prisms, also at right angles, and, after being internally reflected by these, pass out vertically, at right angles to their upper surfaces, through two parallel bodies (fig. 23), whose eye-pieces bring them to a focus in the right and left eyes respectively. The distance between these bodies may be adjusted to the varying distances between the axes of individual pairs of eyes, by adjusting screws at their base, which vary the distance of the lateral prisms from the central. This instrument gives a theoretically perfect representation of a microscopic object in relief, as it would appear if enlarged to the size of its image, and brought to within about 10 inches of the eye; and its chief practical defect is that, as the two bodies are parallel, instead of being slightly convergent, it cannot be continuously used without an uncomfortable strain. But, as its performance depends upon the accuracy of the seven plane surfaces of the three prisms, and on the correctness of their relations to each other, it is liable to considerable error from imperfections in its construction; and, as the instrument can only be used for its own special purpose, the observer must be provided with an ordinary single-bodied microscope for the examination of objects unsuited to the powers of the binocular. This last objection applies also to Professor Riddell's model.

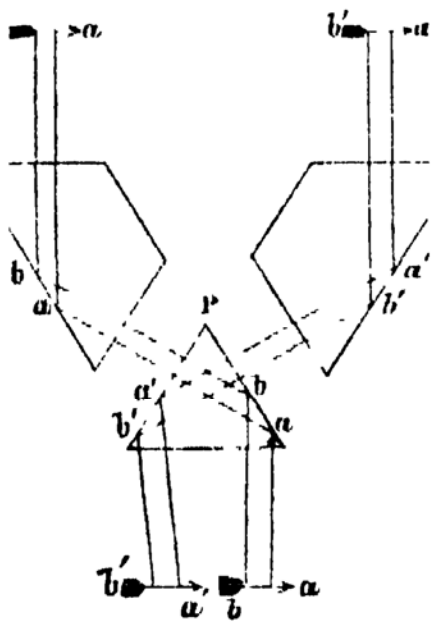

Fig. 22.—Nachet's Binocular Prisms.

It was for these reasons that Mr Wenham, fully impressed with the advantages of stereoscopic vision to the microscopist, set himself to devise a construction by which it might be obtained with the drawbacks inevitable in the working of Riddell's and Nachet's arrangements; and he soon succeeded in accomplishing this on a principle which has proved not only convenient but practically satisfactory, notwithstanding its theoretical imperfection. Only the right half of the cone of rays proceeding upwards from the right half of the objective (*a*, fig. 24) is intercepted by a prism placed immediately over that half of its back lens, which, by two internal reflexions (as shown in fig. 25), sends its pencils obliquely upwards into the left-hand or secondary body L, whilst the pencils of the left half cone pass uninterruptedly into the right-hand body R, and form an image that suffers no other deterioration than that which results from the halving of the angular aperture and the consequent loss of light. The moderate convergence of the two bodies (which, by varying the angles of the prism, may be made greater or less, so as to accord with the ordinary convergence of the optic axes in the individual observer) is much more generally suitable than the parallelism of MM. Nachet's earlier instrument; and the adjustment requisite for variation of distance between the eye-pieces can be made by simply lengthening or shortening both bodies by drawing out or pushing in the diverging eye pieces.

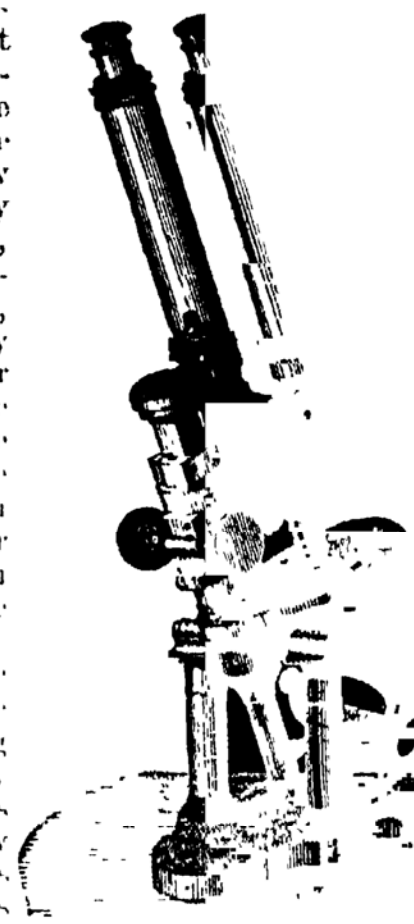

Fig. 23

It may be fairly objected to Mr Wenham's method (1) that, as the rays which pass through the prism and are obliquely reflected into the secondary body travel a longer distance than those which pass on uninterruptedly into the principal body, the image formed by them will be somewhat larger than that which is formed by the other set, and (2) that the image formed by the rays which have been subjected to the action of the prism must be inferior in distinctness to that formed by the uninterrupted half of the cone of rays. But these objections are found to have no practical weight. For it is well known to those who have experimented upon the phenomena of stereoscopic vision (1) that a slight difference in the size of the two pictures is no bar to their perfect combination, and (2) that, if one of the pictures be good, the full effect of relief is given to the image, even though the other picture be faint and imperfect, provided that the outlines of the latter are sufficiently distinct to represent its perspective projection. Hence it, instead of the two equally half-good pictures which are obtainable by MM. Nachet's original construction, we had in Mr Wenham's one good and one indifferent picture, the latter would be decidedly preferable. But, in point of fact, the deterioration of the second picture in Mr Wenham's arrangement is less considerable than that of both pictures in the arrangement of MM. Nachet; so that the optical perfection of the Wenham binocular is in every way superior. It has, in addition, these further advantages over the preceding: greater comfort in using it (especially for some length of time together) which results from the convergence of the axes of the eye at their usual angle for moderately near objects; secondly, this binocular arrangement does not necessitate a special microscope, but may be applied to any microscope which is capable of supporting the weight of the secondary body, the prism being mounted in a movable frame that it may in a moment be taken out of the tube or replaced therein, so that when it has been removed the principal body acts in every respect as an ordinary microscope, the entire cone of rays passing uninterruptedly into it; and, lastly, that the simplicity of its construction renders its derangement almost impossible. Hence it is the one most generally employed by microscopists who use the long-bodied English model.

Fig. 24. Stereoscopic Binocular M

For short-bodied Continental microscopes, however, M

[1] See Silliman's *Journal*, vol. xv., 1853, p. 68; and *Quart. Jour. of Micros. Sci.*, vol. i., 1853, p. 236.

[2] *Quart. Jour. of Micros. Sci.*, vol. ii., 1854. p. 18.

ised an arrangement of two prisms, based on Mr Wenham's ental idea of deflecting one half of the cone of rays into a y body, whilst the other half proceeds onwards without f direction into the principal body. And it is an interest- ure in this construction that, by a simple change in the of the dividing prism, the true "orthoscopic" image may be y a "conversion of relief," to become "pseudoscopic."[1]

ffect of stereoscopic projection may be attained, however, a double body, by the insertion of a suitably constructed r eye-piece into the body rdinary monocular micro A plan of this kind wa- cessfully worked out by s (the very able optician on, United States), who ed a system of prisms to that devised by MM. (fig. 22), but on a much ale, between an "erector ing that used in the eye- n day telescope and a pair ary Huygenian eye pieces, tral or dividing prism aced at or near the plane condary image formed by tor, while the two eye- re placed immediately he lateral prisms, the ion thus making that division in the pencils forming the y erected) image which it makes in the Nachet binocular neil emerging from the objective

Fig. 25. Wenham's Binocular Prism.

oscopic eye piece of a very different construction has been devised by Professor Abbe, who, making use, for the between the two eye-pieces of the rays going to form the ge, of an arrangement of prisms essentially similar to that by Mr Wenham for his non-stereoscopic binocular (fig. 27). either an orthoscopic or a pseudoscopic effect by placing eye piece a cap with a semicircular diaphragm, so as to h half of each of the cones of rays that form the two mages. While in one position of the diaphragms true pic or orthoscopic relief is given, it is sufficient to turn hragms into the opposite position to obtain a pseudo nversion.[2] It appears, however, that this arrangement, possessing points of great interest in relation to the theory ular vision, is not likely to supersede the ordinary Wenham

st be obvious to every one who studies with sufficient the conditions under which true stereoscopic relief can be at no combination of two dissimilar retinal perspectives tisfactory unless the visual pictures represent with tolerable ess the features of the object that lie in different focal planes rovided for, in ordinary vision, by the power of accommo ossessed by the eye, which, while focussed exactly to any e, can also include in its visual picture within certain hat is either nearer or more remote. Now it seems pro , as Professor Abbe has urged, this power of accommoda s into play in microscopic stereoscopy, but there can be on that the visual distinctness of the parts of an object im and beyond the focal plane, and therefore the com- of the stereoscopic image, mainly depends upon the "focal f the objective employed, which, as already explained, is n of its angular aperture. When, however, objectives of long d small aperture are employed in binocular microscopy, each of the two perspective projections may be fairly throughout the effect of solid relief will be very incon- because the pictures are not sufficiently dissimilar to one — the case being exactly analogous to that of the stereo- mbination of two photographic portraits taken at an angle more than a few degrees from each other. Still, with an of 1¼ inches focus and an angular aperture of from 15° to ery distinct separation is made of the focal planes of trans- ections of structure having no great minuteness of detail, especially, as mounted preparations, the solid forms of pillary networks being presented to the mind's eye with a s that no monocular representation of them can afford. 1 inch objective of 20° or 25° is used, the stereoscopic effect much more satisfactory; so that objects of moderate pro- (such as many of the siliceous *Polycystina*, *Diatomaceæ*, be seen in nearly their natural projection, and, if the focal ent. is made for a medium plane, with tolerable distinctness their nearer and remoter parts. With a ⅝ inch of 30° or stereoscopic relief becomes more pronounced; but the ion of the focal depth prevents the several planes of objects relief from being as distinctly seen at the same time. A

½ inch objective of about 40° of aperture, however, affords the satisfactory results with suitable objects,—full stereoscopic being gained without exaggeration, so as to present, *e.g.*, discoidal diatoms and the smaller *Polycystina* in their true f whilst their nearer and more remote parts are seen with suffi distinctness to require only a very slight adjustment of the for their perfect definition. Still more minute objects may be shown by $\frac{1}{16}$ths and ¼th objectives whose angular aperture not exceed 50°; but it can be shown both theoretically practically[3] that the dissimilarity of the two perspective projec of objects in relief formed by objectives of any angle much ex ing 40° is such as to exaggerate the stereoscopic effect; be which, every enlargement of angular aperture so greatly dimin the focal depth of the objectives that only those parts of the ob which lie very near the focal plane can be seen with distinc sufficient for the formation of a good stereoscopic image. H for the purposes of minute histological research, the stereos binocular is (in the present writer's opinion) almost value since, if any distinct perspective differentiation can be gained objectives of the short focus and enlarged angle that are suitable to such investigations, that differentiation will be so as to produce a highly exaggerated stereoscopic effect. If objectives be used binocularly at all, they must be so mounted their back lenses are in very close proximity to the prism; and (transparent) object must be illuminated by an achromatic cond of sufficient aperture to send through it pencils of sufficient d gence to produce the secondary image.

In regard to the advantage derived from the use of the st scopic binocular, with the powers, and upon the objects, suitab produce the true effect of solid form, the writer can unhe ingly assert, as the result of a long and varied experience, in no other way could he as certainly or as vividly image forms to himself, and that in prolonged work upon such sub he is conscious of a great saving of fatigue, which seems attribu not merely (perhaps not so much) to the conjoint use of both as to the absence of the mental effort required for the interpret of the microscopic picture, when the solid form of the object h be ideally constructed from it (chiefly by means of the inform obtainable through the focal adjustment), instead of being di presented to the mind's eye.[4]

Non-Stereoscopic Binoculars.—The great comfort which is ex cured by the microscopist in the conjoint use of both eyes ha to the invention of more than one arrangement by which thi be secured when those high powers are required which cann employed with the ordinary stereoscopic binocular. This is accomplished by Messrs Powell and Lealand by taking advantage of the fact that, when a pencil of rays falls obliquely upon the surface of a refracting medium, a part of it is reflected without entering that medium at all. In the place usually occupied by the Wenham prism they interpose an inclined plate of glass with parallel sides, through which one portion of the rays proceeding upwards from the whole aperture of the objective passes into the principal body with very little change in its course, whilst another portion is reflected from its surface into a rectangular prism so placed as to direct it obliquely upwards into the secondary body (fig. 26). Although there is a decided difference in brightness between the two images, that formed by the reflected rays being the fainter, yet there is marvellously little loss of definition in either, even when the $\frac{1}{16}$ inch objective is used. The disk and prism are fixed in a short tube, which can be readily substituted in any ord binocular microscope for the one containing the Wenham pris

Fig. 26

Other arrangements were devised long ago by Mr Wenham,[5] a view to obtain a greater equality in the amounts of light-rays ing the two pictures; and he has latterly carried one of these into practical effect, with the advantage that the compound prism of which it consists has so nearly the same shape and size as his ordinary stereoscopic prism as to be capable of being mounted in precisely the same manner, so that the one may be readily exchanged for the other. The axial ray *a*, proceeding upwards from the objective, enters the prism ABDEF (fig. 27) at right angles to its lower face, and passes on to *c*, where it meets the inclined face AB, at which this is nearly in contact with the oblique face of the right-a

[5] *Transactions of the Micros. Soc.*, N. S., vol. xiv., 1866, p. 105

36 By internal reflexion from the former and external from the latter about half the beam *b* is reflected within prism in the direction *cb*, while the other half proceeds onwards through the second prism, in the direction *aa'*, pass into the principal body. The reflected half, meeting oblique (silvered) surface DE of the first prism, is again in the direction *db'*, and, passing out of that prism perarly to its surface AF, proceeds towards the secondary The two prisms must not be in absolute contact along the B, since, if they were, Newton's rings would be formed h nicety is required in their adjustment, so that the two may be combined without any blurring of the image in dary body

e prolonged observation, under high powers of objects at the extreme of perfection in definition such for example ity of the cyclosis in plants,—great advantage is gained conjoint use of both eyes by one of the above arrangements

IFORANICAL CONSTRUCTION OF THE MICROSCOPE

otical arrangements on which the working of the compound ie microscope depends having now been explained we may onsider the mechanical provisions whereby the architect upon the different purposes which the instrument is designed Every complete microscope must possess in addition to the ombination of lenses which afford its magnifying power a reon the object may securely rest, and by means of which ion of transparent objects from beneath and reflecting he illumination of opaque objects from above

y, in whatever mode these may be connected with each is essential that the optical part and the stage should be ed as either to be altogether free from tendency to vibrate vibrate together, since it is obvious that any movement which the other does not partake will be augmented to of the observer in proportion to the magnifying power In a badly constructed instrument even though placed eady table resting upon the firm floor of a well built house h powers are used, the object is seen to oscillate so rapidly ghtest tremor—such as that caused by a person walking s room, or by a carriage rolling by in the street—as to be y almost indistinguishable, whereas in a well constructed nt scarcely any perceptible effect will be produced by even disturbances. Hence, in the choice of a microscope it ways be subjected to this test, and should be unhesitatingly f the result be unfavourable If the instrument should be e from fault when thus tested with high power its with low powers may be assumed but, on the other ough a microscope may give an image free from perceptible hen the lower powers only are employed it may be quite use with the higher The method still adopted by some of supporting the body by its base alone is the worst especially for the long body of the large English model, vibration of its lower part is exaggerated at its outer end the support of the body along its length the less tremor en in the microscope image

next requisite is a capability of accurate adjustment to iety of focal distance, without movement of the object It ciple universally recognized in the construction of good oes that the stage whereon the object is placed should be the movement by which the focus is to be adjusted being the optical portion. This movement should be such as to e range from a minute fraction of an inch to three or four ith equal power of obtaining a delicate adjustment at any should also be so accurate that the optic axis of the instrument should not be in the least altered by any movement in a direction, so that, if an object be brought into the centre of with a low power, and a higher power be then substituted, t should be found in the centre of its field notwithstanding reat alteration in the focus In this way much time may aved by employing a low power as a "finder" for an object to ed by a higher one; and when an object is being viewed ession of powers little or no readjustment of its place on should be required. A rack and pinion adjustment if to work both tightly and smoothly, answers sufficiently he focal adjustment, when objectives of low power only ; But for any lenses whose focus is less than half an inch djustment," or "slow motion," by means of a screw movrating either on the object-glass alone or on the entire body ly on the latter), is of great value: and for the highest is quite indispensable. It is essential that in this motion uld be no "lost time," and that its working should not any "twist" or displacement of the image In some microhich are provided with a fine adjustment the rack and ovement is dispensed with, the "coarse adjustment" being merely sliding the body up and down in the socket which ; but this plan is only admissable where, for the sake of heapness or portability, the instrument has to be reduced rm of utmost simplicity, as in figs. 28, 29.

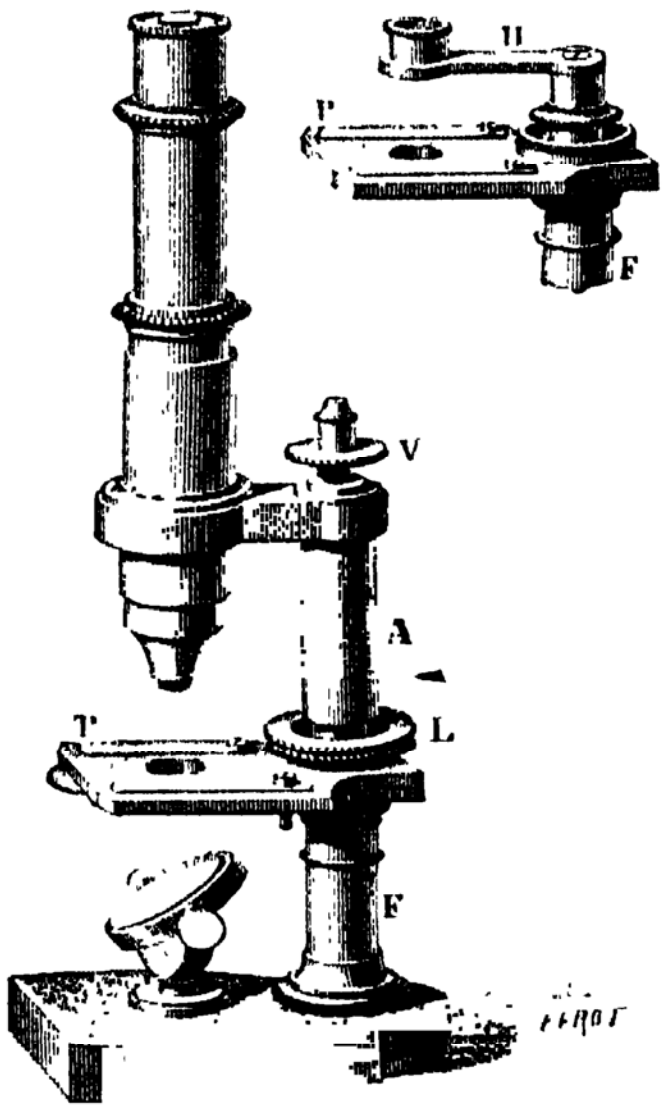
3. Scarcely less important than the preceding requisite, case of the compound microscope, especially with the long the ordinary English model, is the capability of being placed a vertical or a horizontal position, or at any angle with the without deranging the adjustment of its parts to each oth without placing the eye piece in such a position as to be venient to the observer It is certainly a matter of surpr some microscopists, especially on the Continent, should stil the advantages of the inclined position, these being attaina very small addition to the cost of the instrument, but the venience of the vertical arrangement is much less when t of the microscope is short, as in the ordinary Continental and there are many cases in which it is absolutely necessa the stage should be horizontal This position, however, can time be given to the stage of the inclining microscope, by l the optic axis of the instrument into the vertical directi ordinary cases an inclination of the body at an angle of ab to the horizon will usually be found most convenient for strained observation and the instrument should be so con when thus inclined to give to the stage such an elevatio the table that when the hands are employed at it the arm rest conveniently upon the table In this manner a de support is attained which gives such free play to the muscle hands that movement of the greatest nicety may be exec them and the fatigue of long continued observation is diminished When the ordinary camera lucida[1] used for or measuring it is requisite that the microscope should be horizontally It ought, therefore to be made capable of eve variety of position and the stage must of course be provid some means of holding the object whenever it is itself p such a position that the object would slip down unless susta

4 The last principle on which we shall here dwell as to the value of a microscope designed for ordinary work, is ity in the construction and adjustment of every part M genious mechanical devices have been invented and exec the purpose of overcoming difficulties which are in themselve trivial A moderate amount of dexterity in the use of the sufficient to render most of the operations and without dexterity no one, even with the most complete mechanical will ever become a good microscopist There is of course, to this simplification and no arrangement can be objecte this score which gives advantages in the examination of objects, or in the determination of doubtful question such simpler means can afford The meaning of this distinct become apparent if it be applied to the uses of the mec stage and the achromatic condenser For although the mec stage may be considered valuable and in observation as for the finding of a minute object or the examination of the surface of a large one yet it adds nothing to the clearness view of either and its place may in great degree be supplied fingers of a good manipulator On the other hand, the use achromatic condenser not only contributes very materially absolutely indispensable to the formation of a perfect image case of many objects of a difficult class the want of it ca compensated by the most dexterous use of the ordinary app and consequently although it may fairly be considered supe as regards a large proportion of the purposes to which the scope is directed whether for investigation or for display regards the particular objects just alluded to it is no less ne part of the instrument than the achromatic objective itself

A typical example of the simplest form of compound scope that is suitable for scientific research which, with modifications of detail is the one generally employed on t ment the *Working Microscope for Observation* (fig 28 Nachet especially as constructed for portability (figs 29 31 particularly worthy of description In its vertical form (fig solid foot to which the mirror is pivoted gives support pillar I to the top of which the stage P, having a diaphrag by a thumb screw attached On the top of this pillar the barrel or tube A is fitted in such a manner that it may be rem unscrewing the large milled head I — though when this screwed down the system stands quite firmly This stem has its summit a short horizontal arm which carries a strong tube that firmly grasps the 'body' of the microscope wh mitting this to be easily slid upwards or downwards so as a coarse adjustment of the focus The 'fine adjustment made by turning the milled head V which either presses de outer tube of the stem, or allows it to be raised by the upwa sure of a strong spiral spring in its interior By means of milled head I the stem A with its arm and compound body detached from the pillar and, a small brass arm H holding single lenses or doublets being slid into the accompanying di microscope is thus provided The only drawback in the co tion of this simple model is its not being provided with a j

[1] A camera lucida adapted for use with the vertical microscope has vised by M Nachet

ination of the body; but this is introduced into the port- on of the instrument shown in fig. 29, the basal portion of fig. 30) can be used, like that of the preceding model, as a microscope, and, by a most ingenious construction, can be d as to lie flat in a shallow case (fig. 31) that holds also the part with the objectives of both the simple arm and the com-



28.—Nachet's Combined Simple and Compound Microscope.

body. M. Nachet now connects his objectives with the his microscopes, not by a screw, but by a cylindrical fitting place by the pressure of a spring-clip against a projecting e. This method not only allows one objective to be re- and replaced by another much more readily than does the ring, but also renders the centring of different objectives actly con- e. It may y affirmed very large on of the pic work last half- which has n entirely ect to bio- rience, has ne by in- ts of this ontinental

er model, , was from t adopted ritish opti- and, as a example of neral plan onstruction st followed England he United the im- Jackson- ver micro- of Messrs g. 32) may be appropriately selected. The tripod base of rument carries two pillars, between which is swung upon a al axis (capable of being fixed in any position by a tighten- w) a solid "limb," with which all the other parts of the nt are connected,—a plan of construction originally devised eorge Jackson. The binocular body, having at its lower end g. 24) an opening into which either of the Wenham prisms serted, and at its top a rack movement for adjusting the eye-

to the limb (the axis of which passes through the point at he object-plane is intersected by the optic axis of the hung the swinging tail-piece invented by Mr Zentmayer of phia, which, carrying the whole illuminating apparatus, so set as to give to the axis of the illuminating pencil any degree of obliquity. To the upper part of it is attached nd-pinion movement carrying the "substage," which is with two milled-headed screws for centring it pre- ith the microscope-body. Into this may be fitted the tic condenser, parabolic illuminator, polarizing prism, or r kind of illuminating apparatus; whilst at its lower end s the mirror, the position of which may be varied by sliding ng up or down the "tail-piece," or by turning the arm rries it to one side or the other; while, if direct illumina- n a lamp should be preferred, it may be turned altogether By swinging the tail-piece round above the stage, oblique y be reflected from the mirror, through the condenser, upon er surfaces of objects. The condenser usually fitted to rument is of about $\frac{4}{10}$ inch focus, with a large back lens; which are placed an iris-diaphragm for reducing the light entral rays, and a diaphragm-plate with apertures of the forms most suited for the resolution of lined objects by rays.

strument, in the writer's judgment, is better adapted than the highest purposes of microscopical research It works ly with every power from the lowest to the highest, and is of receiving any one of the numerous pieces of apparatus ave been devised for special researches of various kinds. iled description of these not being here admissible, it will ient to indicate the polariscope and the spectroscope as the portant of these accessories.

Micrometry.

icroscopist has constant need of some means of taking exact ments of the dimensions of the minute objects, or parts of on the study of which he is engaged; and the accuracy of ation will of course be proportioned to the correctness of dard used, and the care with which it is applied.

nstruments employed in microscopic micrometry are of two he measurement being taken in one by the rotation of a w with a divided milled head, whilst in the other a slip ruled with lines at fixed distances gives a scale which forms f computation. Each of these has its advantages and its ntages.

tage-micrometer constructed by Frauenhofer was formerly ed by Continental microscopists, and has the advantage of ng the actual dimensions of the objects to be measured; as the two special disadvantages that a sufficiently small nnot be conveniently given to its divisions, and that any its construction and working is augmented by the whole ing power employed. This instrument has now, however, ntirely given place to one of those to be next described.

crew-micrometer ordinarily used in astronomical measure- see Micrometer) can be adapted to the eye-piece of the pe in a manner essentially the same as that in which it is to the telescope,—its two parallel threads of which one is d the other made to approach towards or recede from this urning of the screw—being placed in the focus of the eye- d being therefore seen as lines crossing its field of view. et is so focussed that its image is formed in the same plane; latter being brought into such a position that one of its ends ns lies in optical contact with the fixed line, the screw is o as to bring the movable line into the like coincidence other. But the distance between the lines, as given by the of divisions of the micrometer, will here be the measure- ot of the object itself, but of its magnified image; and the these divisions, therefore, will depend upon the amplifica- on by the particular objective used. Thus, suppose each of the micrometer to have an actual value of $\frac{1}{10000}$th of an d the visual image to have one hundred times the linear ons of the object, the theoretical micrometric value of each would be $\frac{1}{100}$th of $\frac{1}{10000}$th, or one-millionth, of an inch,— of minuteness, however, not practically attainable. It is y, moreover, to determine the micrometric value of the s of the micrometer, not only for every objective, but for ns in the conditions under which that objective may be d, as regards the length of the tube or "body" of the pe, which is varied not only by the draw-tube, but also, y cases, in the working of the fine adjustment or slow and also, in the case of the large-angled powers furnished justment for thickness of the covering-glass, for the degree ation of the front- from the back-glasses of the objective, nakes a very sensible difference in its magnifying power. termination is made by means of a divided glass stage- eter put in the place of the object, so that the lines ruled upon ed intervals shall be projected upon the field of view. The icrometer is usually ruled either to 1000ths of an inch or 100ths of a millimetre; and it is convenient that one of the d of its image should be made to coincide exactly with a certain of divisions of the screw-micrometer. This may be done by le ing the draw-tube, so as to increase the amplification of t until coincidence has been reached; and the exact amount lengthening should be noted,—as should also the precise of the milled head of the slow motion (if it acts on the ob instead of on the body as a whole), and of the adjusting scre of the objective itself. Thus, if two lines of the stage-mic separated by 1000th of an inch be brought into coinciden the two threads of the eye piece micrometer, separated b divisions of the screw milled head, the value of each of tho sions is $\frac{1}{10000}$th of an inch. If the above conditions be p recorded for each objective used in micrometry, the micr value of the divisions remains the same for that objective, w it is employed under the same conditions.

The errors to which micrometers are subject arise (1) fr equalities in the ruling of the stage micrometer, (2) from irr ties in the screw of the eye-piece micrometer, (3) from "los in its working, and (4) from the thickness of its threads. I to eliminate the first and second, it is well to determine t tion of the divisions of the two micrometers by the compa a considerable number of both; the third proceeds from an fection of workmanship which, if it shows itself sensibly, destroys the value of the instrument, while the fourth rectified by the exercise of skill and judgment on the part observer. For, if the micrometer is so constructed as to re when one thread lies exactly upon the other, its divisions i the distance between the axes of these threads when separate the dimensions of any object (such as a blood-corpuscle between their borders will obviously be too great by half th ness of the two threads, that is, by the entire thickness thread. When, on the other hand, the measurement is bei (as of the distances of the striæ on diatoms) by the coin between certain lines on the object and the axes of the th the micrometer, the dimensions indicated by the division screw milled-head will be correct.

The costliness of a well-constructed screw micrometer formidable obstacle to its general use, a simpler method (de Mr George Jackson) is more commonly adopted, which co the insertion of a ruled-glass scale into the focus of an Huygenian eye-piece, so that its lines are projected on the view. This scale (ruled, like an ordinary measure, with ev line long, and every tenth line double the length of the fixed in a brass inner frame, that has a slight motion in th tion of its length within an outer frame; and this last, bein duced through a pair of slits into the eye piece just ab diaphragm, and being made to occupy the centre of the brought exactly into focus by unscrewing the eye glass a may be requisite. When the image of the object to be mea brought by the focal adjustment of the object-glass into t plane, a small pushing-screw at the end of the micrometer action is antagonized by a spring at the other end) is turn one of the long divisions of the scale is brought into optical with one edge of the image of the object to be measured, number of divisions is then counted to its other edge, the op being exactly that of laying a rule across the real object if e to the size of its image. The micrometric value of each div this eye-piece scale must be carefully ascertained for each ob as in the case of the screw micrometer, the error arising f equality of its divisions being eliminated as far as possible by an average of several. The principal point of inferiority form of micrometer is that, as its divisions cannot be nearly so small a value as those of the screw-microm estimate of fractional parts of them often becomes necessary is objectionable as involving an additional source of error. this objection, Hartnack has introduced the diagonal scale mathematical instruments before the invention of the verni

Another mode of making micrometric measurements, w some purposes has considerable advantages, is to employ micrometer in combination with some form of camera attached to the eye piece of the microscope, so that the its divisions may be projected upon the same surface as which the image of the object is thrown. By first using t stage-micrometer, and marking on the paper the average of its lines as seen in the central part of the field, and the the paper accordingly, the micrometric value of the divi projected may be exactly determined for the objective emplo the distance of the drawing-plane from the eye-piece,—so th the image of any object is projected under the same condit dimensions of that image or of any parts of it can be exactly m upon the divided scale previously projected, and the true sions of the object thus easily ascertained. If, for exam lines of a stage-micrometer ruled to the thousandth of should, when thus projected, fall at a distance of an inc then the application of an ordinary scale of inches (divi tenths) to the image of an object projected by the same

the same plane would give its real dimensions in dths of an inch, while the tenths of the inch scale would nt a real dimension of as many ten-thousandths. It is often le to make such measurements from careful tracings of the s of objects, rather than from the visual images,—this plan specially advantageous when the exact dimensions of many objects have to be compared, as in the case of blood-cor-, precise measurements of which are not unfrequently required cial inquiries. It was by the use of this method that the Gulliver made his admirable series of measurements of the and extreme dimensions of the blood-corpuscles of different s. And more recently Mr Dallinger has shown, by first making a very fine camera lucida tracing of *Bacterium* under an amplification of 2000 diameters, and measuring the of its body in the mode above indicated (which gave it as of an inch), and then by magnifying his tracing from fiv diameters, and comparing, by means of the screw-microm breadth of the flagellum with that of the body (which las to be just ten times as great),—that, although the theoreti of resolving power for closely approximated lines is $\frac{1}{120,000}$ inch, a semitransparent filament whose breadth is not grea $\frac{1}{2,000,000}$th of an inch may be clearly discerned, and even n with a close approximation to accuracy (*Jour. of Royal Society*, vol. i., 1879, p. 169). W.

DAS, king of Phrygia, is one of those half-legendary in whom religious legends have gathered round a rson. The name Midas the king, ΜΙΔΑΙ ΓΑΝΑΚΤΕΙ, on a very ancient tomb in the valley of the Sangarius, gendary seat of the Phrygian kingdom (*Iliad* iii. The Phrygian monarchy was destroyed by the rians about 670 B.C., and the last king Midas com-suicide by drinking bull's blood. The name Midas in Greek tradition the representative of this ancient y, but all that is told of him is religious myth. He ure in the cycle of Cybele legends, the son of the s and her first priest. He is also closely connected e cultus of Dionysus, like the two heroic personages s and Silenus. The Midas legend was known on Bermius in Macedonia, and must at one time have in Greece; two cities Midea, in Argolis and in , recall the Phrygian city Midaeum.

erod. viii. 138; Xen., *Anab.*, i. 2, 13; Paus. i. 45, &c.

DDELBURG, in Holland, the ancient capital of the e of Zealand, situated in the middle of the island cheren, is mentioned as early as 1153, and receives e "town" in a charter granted it in 1227. It has characteristics of an old and worn-out place. The ion (25,000 in 1739) had sunk to 12,000 or 13,000 beginning of the 19th century, and has only begun to increase again, being 15,939 in 1882. The g-houses, which in 1739 were about 3800, are now 00, and of these about 600 are unoccupied. The archouses and imposing mansions once belonging to families, which have either died out or left the all up the memory of that prosperity which Middel-njoyed before its extensive trade, with the East and ndies, with England and Flanders, was ruined by r with England and the French occupation. By ning of the railway (1872) and of the ship canal to Flushing Middelburg was lifted out of its isola-d, with the assistance of the chamber of commerce, eturing industries (iron, machinery, furniture, oil, &c.) were established; but the prosperity anticipated shing, and consequently for Middelburg, remains zed. One of the chief sights of Middelburg is the d town-house, for the most part erected in 1512–13, s front gable adorned with twenty-five statues of and countesses of Holland and Zealand; it contains hives, and a most valuable antiquarian and historical on. The abbey, begun in 1150, has frequently been idence of royal visitors (Maximilian, Philip the Fair, s V., and so on down to Napoleon I., and William I., l III.); part of it is now an hotel, and part of it is d by the provincial authorities. The great hall of lding, in which the states of Zealand assemble, is l with beautiful tapestries by Jan de Maecht, repre-the heroic feats of the men of Zealand in the with Spain. What was formerly the nave of the hurch is now the New Church, and the ancient choir ates the Choir Church. The former contains a fine resting on an eagle, the monument of William, king of the Romans (d. 1256), and the tombs of Ja Cornelis Evertsen, two naval heroes who fell in t against England in 1666; the latter has the mon of the learned Hadrian Junius and of Jan Piete The provincial court, the corn exchange, the Hof S and the Hof St Sebastian (formerly buildings belon the guilds of archers, and now places of amusement) mention. The great museum of Zealand antiquit lected by the Zealand Society of Arts and Sciences (f at Flushing in 1769 and transferred to Middelb 1801), shows that the town is the intellectual centre province.

The principal facts in the history of Middelburg are the s the Flemings in 1288, 1296, and 1303 (the last resulting capture of the town by Guy of Dampierre); the recovery town from the Spaniards in 1574, after an investment of ne years; the frequent disturbances among the townsfolk in t and 18th centuries; the surrender to the English in 1809; arrival and departure of the French in 1809 and 1814.

MIDDLEBOROUGH, a town of the United St Plymouth county, Massachusetts, 34 miles south of It has a handsome town-hall and a public library, m tures woollen goods, straw goods, shovels, shoes, ca &c., and in 1880 had 5237 inhabitants.

MIDDLESBROUGH, situated near the mouth Tees, on its south bank, in the North Riding of Yor has now become the principal seat of the Englis trade. It is a municipal and parliamentary bo locally governed by a mayor and corporation, and a member to parliament. The earlier history of th is meagre. Where Middlesbrough now stands (C *History of Cleveland*) there were at one time a small and priory founded by Robert de Brus of Skelton These were dedicated to St Hilda, and with some were given by De Brus to the abbey of St Hilda at W in 1130. The priory fell into ruins at the time Reformation, and no trace now remains beyond some built into the wall of a brewery. The mayor's cha is made from a fragment. In 1801 there were up site of Middlesbrough only four farm-houses. In company styling itself the Middlesbrough Owners 500 acres of land, and commenced building the tow 1830 the Stockton and Darlington Railway was ex from Stockton to Middlesbrough; four years later th was lighted with gas; and after six years more a market was established. The census of 1831 show population to be 154; that of 1841 showed 570 1842 the opening of the docks gave additional impe to the town. First containing an area of 9 acres were extended in 1872 to 12 acres, with 1700 quays. Vessels of 3000 tons burden can be accomm From the year 1851, when J. Vaughan discover presence of ironstone in the Eston Hills, the town ad with rapid strides. When the jubilee of the town w in 1881 (a year late) the population had risen to the area to 2731 acres, and the rateable value to £1 the population of the parliamentary borough (are acres) being 72,145. In the district there are upw

130 blast furnaces, besides large iron and steel works; and the Thomas-Gilchrist process of making steel promises for Middlesbrough importance in the future as a steel entrepôt. The make of pig-iron in 1880 was 1,991,032 tons. There are also shipbuilding, potteries, chemical works, and a salt trade. Middlesbrough is well laid out, nearly all the streets lying at right angles to one another. Many of the churches and the exchange are handsome buildings, while the station of the North Eastern Railway is probably the finest in the north of England. A splendid park of 72 acres, the gift of the late H. F. W. Bolckow, adds greatly to the amenity of the town.

MIDDLESEX, an inland county in the south east of England, lying between 51° 25′ and 51° 40′ N. lat., and between 0° and 0° 36′ W. long. On the south it is divided from Surrey and Kent by the Thames, on the east from Essex by the Lea, on the west from Buckinghamshire by the Colne, and on the north from Hertfordshire by a partly artificial and very irregular line. Although with the exception of Rutland it is the smallest county in England, its population is exceeded by that of Lancashire only. Its total area is 181,317 acres, of which 2592 acres are common or waste lands. The longest straight line that can be drawn in the county is one of nearly 28 miles from the north-eastern extremity near Waltham Abbey to the south-western at Staines. From north to south in the broadest part the distance is about 15 miles.

Surface and Geology.—The greater portion of the county is flat, although there are sufficient undulations to allow of a proper drainage of the land. A range of hills runs along the Hertfordshire border by Barnet, Elstree, Stanmore, and Pinner, averaging 400 feet in height; another range occupies the ground just north of London by Hornsey, Highgate, and Hampstead; Harrow occupies an isolated eminence between the two ranges.

The county lies entirely within the basin of the Thames, and the London Clay extends over a large portion of the surface. This formation stretches from the mouth of the estuary of the Thames to the neighbourhood of Marlborough. It attains its greatest breadth (little short of 30 miles) in the neighbourhood of London, and extends northward until it is lost beneath the drift of Suffolk and Norfolk. The following is a table of the various beds of rock which occur at the surface, with their greatest thickness (in feet) in the district:—

Alluvium (recent river deposits)	15
Post-Pliocene Tertiaries.	
Post-glacial beds (brick-earth, gravel, &c.)	50
Glacial drift (boulder clay, gravel, &c.)	80
Eocene Tertiaries.	
Lower Bagshot sands	100
London Clay	420
Woolwich and Reading beds	90
Cretaceous.	
Chalk with flints	800

Chalk comes to the surface in so very few places that it is scarcely worth mention. It is seen near Harefield and on the north-west side of South Mimms. The depth from the surface to the chalk varies greatly in different parts of the county. This has been proved by the borings for wells, thus at Isleworth the depth is 400 feet and at Hampstead 378, while at Ruislip it is 76 feet and at Pinner only 60. The Reading beds (plastic clays) are brought to the surface at Windsor. They follow roughly the course of the river Colne from the north of Uxbridge along the flank of the hills north-eastward, but are sometimes cut back southward along small side valleys. An outlying mass is exposed at Pinner. The Bagshot sands, consisting of gravel and sand permeable to water, once stretched over the whole extent of the London Clay, but they are now to be found only on the high grounds at Hampstead, Highgate, and Harrow. A corner of the main mass ent south-west corner of the county near Littleton. I brick-earth occur in the drift between West Drayt Uxbridge.

Several deep borings in the London basin pro existence beneath the chalk of beds which do not c in Middlesex. Three of these are in the county; a most interesting is that at Meux's Brewery, Tot Court Road (about 1146 feet), which passes throu following formations: gravel and clay, 21 feet; Clay, 61 feet; Reading beds, 51 feet; Thanet sand, chalk, 655 feet; Upper Greensand, 28 feet; gau feet; Lower Greensand, 64 feet; Devonian, 80 fee

Rivers and Canals.—The Thames is very tortuous 14 miles of its course from Staines to Blackwall, and a remarkable bend at the eastern limit of the county it forms the so called Isle of Dogs. The width at is 200 feet, at Chiswick opposite Barnes 310 Hammersmith 525 feet, at Fulham 820 feet, at W ster Bridge 1100 feet, but at London Bridge it is le 800 feet; above the junction of the Lea at the Isle the width is 1350 feet. The ordinary rise of the London Bridge is 16 feet, and the tide-way ends a dington. The port of London begins below London and the channel for from 2 to 3 miles is called the

The Colne from Hertfordshire enters Middlesex north-western corner of the county. It then runs joining the Thames at Staines, and in its course Middlesex from Buckinghamshire for 15 miles. A river leaves Uxbridge it divides out into severa channels. The Lea from Hertfordshire enters Mi at the north eastern corner of the county near W Abbey. It runs south, dividing Middlesex from E 15 miles, and falls into the Thames at Bow Cree branches flow off from the river during its course Brent from Hertfordshire enters Middlesex near F It takes a circuitous direction southward throu middle of the county by Hendon, Kingsbury, T Greenford, and Hanwell to the town of Brentford, unites with the Thames. Where the river crosses th ware Road (about 3 miles south of the town of Ed it is expanded by artificial means into an extensiv voir. The Cran (or Yedding Brook) rises in the between Harrow and Pinner and flows under Bridge; it crosses Hounslow Heath, and bends r Twickenham and Isleworth, where in a divided st falls into the Thames.

There were several other small streams in the nei hood of London which have left their mark in th of places, but which are now merely sewers, such Wallbrook, the Westbourn, the Tyburn, the Fle &c. The last mentioned, which runs into the Than Blackfriars Bridge, was formerly navigable as Holborn Bridge, but, the Fleet Ditch, as it was the having become in the last century a dangerous n the lord mayor and citizens were empowered by Parliament to arch it over. The work was comme 1731, and in 1737 Fleet market, occupying the sit space from Holborn Bridge to Fleet Bridge, was o the public. The New River, an artificial water co structed by Sir Hugh Myddelton in the reign of J to supply London with water, runs through the cou north to south a little to the west of the river derives its waters from the springs of Amwell and C increased by a cut from the Lea, in the neighbour Ware, and enters Middlesex from Hertfordshire miles north of Enfield. It passes Enfield, Tot Hornsey, and Stoke Newington, and is received reservoir in Clerkenwell known as the New River

The Grand Junction Canal leaves the Thames a

roceeds in a westerly direction by way of Hanwell
anford to West Drayton; thence in a northerly
n it follows the valley of the Colne. It passes
lge, and after leaving the county takes its further
by Rickmansworth through Hertfordshire. The
gton Canal leaves the Grand Junction Canal at
rd, and passes Northolt, Apperton, Twyford (where
rried over the Brent by an aqueduct), and Kensal
At Paddington it joins the Regent's Canal, which
the north of Regent's Park, and after proceeding
h the eastern portions of London joins the Thames
house. The Regent's Canal is joined to the river
means of Sir George Duckett's Canal, and thus
s a through communication from the north eastern
of the county to the south-eastern corner, thence
st to west, and northward to the north west corner.

ate, Soil, Agriculture, &c. The climate of the
is equable and good, and the shelter of the northern
akes the air mild. Highgate, Hampstead, and
ther parts are supposed to be specially healthy, and
ommended for invalids by the medical profession.

Railways and Roads. As London is the centre of the
system of England, it is evident that many of the lines n
through Middlesex. For similar reasons it is well provid
roads.

Population. The total population of Middlesex was 2,53
1871 and 2,920,485 in 1881, or excluding the seven metr
boroughs lying within the county 276,028 in 1871 and
in 1881. Most of the towns and villages have largely i
during the period between 1871 and 1881; the populations
and Tottenham have more than doubled, and Chiswick,
Edmonton, and Willesden have almost doubled. Of th
places the least increase has been at Brentford, which n
10,271 in 1871, and reached 11,808 in 1881. At the tim
Domesday survey the population of Middlesex, exclusive of
was 2302.

Government. Unlike other counties, Middlesex has
sheriff appointed by the sovereign. It is subject to the
London, and one of the sheriffs appointed by the lord mayor
for Middlesex. When Henry I. came to the throne he gave
an extensive charter, and one of the privileges either gr
confirmed by the king was the perpetual sheriffwick of Mi
The whole of the county is included in the diocese of
and is divided between the archdeaconries of London and Mi
When Henry VIII. created the bishopric of Westminster he
the whole county (the parish of Fulham alone excepted)
diocese. Edward VI., however, dissolved the bishopric
fourth year of his reign.
The county is divided into six hundreds, which remain t
as they were at the time of the Domesday survey, except
name of one has been changed:—Ossulston (Osulvestane D.),
ton (Delmetone D.), Gore (Gara D.), Elthorne (Helet
Helethorne D.), Spelthorne (Speletorne or Spelethorne D
worth (Honeslaw D., *i.e.*, Hounslow). The division into h
is now merely a name, and a record of a former system
government.
There are thirty two poor-law unions, but the unions
London are only eight in number, viz., Brentford, Ed
Fulham, Hackney, Hampstead, Hendon, Staines, Uxbridg
The majority of hospitals are in London, but there is a

minster, Finsbury, Marylebone, the Tower Hamlets, Chel
Hackney, with one for the university of London.
In the parliament of 1295 Middlesex was represented,
members; in 1298 London sent two members as well as the
For the parliament of 1320 and subsequent parliaments
elected four members, but it does not appear that all were
to sit. From the 15th century, however, the city has alw
four members to parliament. In 1547 Westminster first
two members, and from that time until 1832 the only se
those for the county and the two boroughs. In 1832 the bor
Finsbury, Marylebone, and Tower Hamlets were added, and
the boroughs of Chelsea and Hackney and the university of
History.—The district now included in Middlesex was
occupied by forest up to a comparatively recent period,
population must always have been very sparse. A few pre
remains have been discovered at various times,—bones
elephant, hippopotamus, deer, &c., at Old Brentford, el
near Chelsea Hospital, fossil teeth, fish, fruit, &c., at H
and quite recently, in 1879, while the foundations were be
out for Drummond's New Bank at Charing Cross, a large
of prehistoric animal remains. Flint instruments have a
found to cover a considerable area. During the British pe
district is supposed to have been inhabited by the Trinobar

MIDDLESEX

Dr Guest affirms that the valley of the Lea was the western
y of that tribe. In answer to the question— What became
strict between the Lea and the Brent? this great authority
at the district was merely a march of the "Catuvellauni,"
on through which ran a wide trackway, but in which was
town, village, nor inhabited house. Dr Guest also declares
boundaries of the Catuvellaunian state, a central kingdo
or much extended by Cassivellaunus, can be traced in part
e northern limit of Middlesex by following an earthwork
Grimesditch "from Brockley Hill to the woodland of the
alley and thence to the Brent, and down the Brent to the
."[1] Some earthworks and encampments still exist which
buted to the Britons.

the country was under Roman rule great improvements,
the growing importance of Londinium, were made in this
Several roads in connexion with the city must have been
ted, more especially the great northern and eastern roads
t does not believe that the present Watling Street could
d any connexion with the Watling Street which came down
geware Road, passed along by Park Lane, and crossed the
at Westminster. In the Antonine Itinerary mentio
three stations, viz., Londinium, Sullomacæ, and Pon
ca is now Brockley Hill; Pontes is supposed by Stukeley
Staines, but Horsley held that it was intended for Old
r, and others supported the claims of Colnbrook and Le
Roman camps have been found in many parts of the county.
Stukeley supposed that the Brill, near St Pancras, was the
e battle between Boadicea and the Roman legions which has
light record in the name of Battle Bridge. The Roman
found at different times are too numerous to mention here
l. Coins, urns, and tiles were found at Enfield, a sepulchral
Hampstead, and numerous gold coins and ornaments at
Priory, Great Stanmore, in 1781.

y Stakes, about a furlong west of Walton Bridge, is supposed
e locality of the ford by which Julius Cæsar crossed the
. Cæsar makes special mention of the sharp stakes which
to encounter, and Bede says that the remains of the stakes
be seen in his day. Camden was the first to fix upon this
pot where Cæsar crossed, and he is supported by Dr Guest,
identification is not undisputed. Although a ford existed
late as 1807, and stakes were found up to the end of the
ntury, it has been affirmed that they were placed in the r
with another object than to oppose an enemy's progress.
remains have been found at Shepperton near Halliford, at
ddlesex end of the ford. A vase was dug up in 1817, and
ains of a Roman cemetery have also been discovered.

the earliest Saxon occupation we are left very much to
and the name itself is somewhat of a puzzle. It is evident
tribe could have obtained the name of Middle Saxons until
e settlement of the districts on each side of it by the East
West Saxons. As Middlesex was for a period dependent
e kingdom of Essex, it is probable that the name did not
to use until London had become a Saxon city, although there
n to believe that previously Saxon settlements had been
n several places by the river and elsewhere. Bede tells us
ondon was in the hands of King Sæberet in 604, and was then
ef town of Essex. Just a century afterwards - that is, in 704
king of the East Saxons granted away land at Twickenham,
g that Middlesex was then dependent upon Essex. It is
of note that the two districts now forming the counties
ch London and Southwark are situated were separated
he kingdoms to which they originally belonged probably
unt of the importance of the city of London and the borough
thwark, Middlesex from the kingdom of Essex and Surrey
South Ridge (A.-S. Suð-rige) from the kingdom of Kent.
ddlesex appears never to have been independent. The admin
shire was let to the men of London and their heirs to be
farm of the king and his heirs, and "the subject shire has
mit to the authority of the sheriffs chosen by the ruling

ddlesex is only once mentioned in the Saxon Chronicle, under
011, where it is noticed as one of the districts overrun by
nes. One manuscript (A. Winchester) mentions the Middle
as receiving the true faith under their alderman Peada
; but this is evidently a mistake of the scribe, for the fact i
from Bede, and he writes Middle Angles, as do the other
of the Chronicle.[3]

The Saxons appear to have settled over a large portion
district, and for the purpose of settlement they must have
considerable clearings in the vast forest of Middlesex. There
to be good reason for believing that previous to their comi
roads passed through waste lands. By the time of Edwa
Confessor a large proportion of the present towns and villag
in existence. Mr Elton, in his *Origins of English History*,[4] m
a curious fact with relation to the tenures which prevailed i
of these places. He alludes to a ring of manors encircling
London where the custom of Borough English or junior rig
prevalent." He then goes on to point out that in this clu
manors there are several varieties of the custom:- "Its ben
Islington and Edmonton was confined to the youngest s
Ealing, Acton, and Isleworth it extended to the brothers an
collateral heirs; and in a great number of instances the p
was given to females as well as to males in every degree of r
ship. These variations are of no very great importance, the
being modified in all parts of the country by the rule that
proof must be given of any extension of that strict form of
English for the benefit of the youngest son of which alone the
have cognizance. But it is of the greater interest to obser
in several places near London 'it is the custom for the
descend to the youngest, if it is under a particular value
pounds, but if it is worth more, it is parted among all th
First Real Property Commission Evidence, p. 254.

The great forest of Middlesex continued long after the N
Conquest, and even as late as the reign of Elizabeth portio
stud existed quite close to London. Fitz Stephen, the
Canterbury and secretary to Thomas à Becket, mentions
interesting description of London the immense forest w
densely wooded thickets, and its coverts of game, stags,
e, boars, and wild bu A few years after Fitz Stephen's
n the reign of Henry III. (1218), the forest was disafforest
some of the wealthy citizens took the opportunity of pur
land and building upon it. Matthew Paris, in his life of the
abbot of St Albans, describes the woods contiguous to the
Street between London and St Albans almost impenetral
so much infested by outlaws and by beasts of prey that the
ous pilgrims who travelled along the Roman road to the s
Albans were exposed to imminent danger.

There is little further history that can be told of Mi
There are many interesting incidents connected with some
places, but corporate life has been crushed out of the count
greatness of London. Not a single place except London ha
nto importance, and nowhere outside of London is there a
of first-rate interest. The villages on the Thames early b
increase in size on account of the convenience of loc
supplied by the river. It is only since the extension of the
system that the villages to the north and north west of
have grown in size, and this growth has been mainly due
building of houses for the use of the Londoners.

MIDDLETON

ODDLETON, a market and manufacturing town of shire, is situated on the Irk, near the Rochdale and on the Lancashire and Yorkshire Railway, 5 miles north of Manchester and 4 west of Oldham. ludes the township of Tonge, an isolated portion of arish of Prestwich. The church of St Leonards is an rncture of mixed architecture, with a low square The oldest portion of the building dates from the rentury, but the main portion from 1412, and the aisle from 1524. It underwent extensive restoration 59. The Queen Elizabeth Grammar School, a build the Tudor style, was founded in 1572. There are baths and a free library. The prosperity of the town from the introduction of manufactures at the close of entury. The staple trade is the spinning and weaving ton, and the other industries include silk weaving, printing, bleaching, dyeing, roundings, and the facture of soap and chemicals. There are several nes in the neighbourhood. The town was at an early in possession of the Bartons, from whom it passed rriage in the 16th century to Sir Ralph de Assheton. opulation of the urban sanitary district of Middleton onge in 1881 was 18,952.

DDLETON, Conyers (1683–1750), the earliest and eminent example of the spirit of theological rational the English Church of the 18th century, was the the rector of Hunderwell near Whitby, and was born hmond in Yorkshire, on December 27 (or, according other account, on August 3), 1683. He graduated at dge, took orders, and in 1706 obtained a fellowship, he soon resigned upon contracting an advantageous ge. In 1717 a dispute with Bentley, upon an ionate demand of the latter on occasion of Middleton's created D.D., involved him in an acrimonious con sy, which called forth several pamphlets from his ll of powerful invective, and among them his first erable literary performances, the *Remark* and *r Remarks* on Bentley's *Proposals for a New Edition Greek Testament* (1721). "You have laid Bentley pon his back," wrote Colbatch. "I scorn to read the rascal has written," wrote Bentley, who, how only resorted to this affected disdain after a fruitl pt to fix the authorship upon Colbatch, but who gratly have commented upon the impropriety of ton's endeavour to vent his grievances upon the text New Testament. Private resentment and uncharit ality were throughout his life too frequently the and the note of Middleton's controversial publica In 1723 he was involved in a law suit by person against Bentley, which had found their way into the were judicious tract on library administration, n occasion of his appointment to the honourable of university librarian. In 1726 he gave great to the medical profession by a dissertation contend ing the healing art among the ancients was only ised by laws or freedmen. Between the dates of publication he visited Italy, and made those observa on the parent pedigree of Italian superstitions which subsequently embodied in his *Letter from Rome* (1729). cogent tract, while establishing the author's man sition with abundance of learning and wit, gave at the time the best clear indication of the anti-supernatural bias of his intellect, and probably contributed to re the storm which burst out against him on his next cation (1731). In his common trance with Waterland asion of the latter's reply to Tindal's *Christianity as s the Creation*, Middleton takes a line which in his ould hardly fail to expose him to the reproach of lity. He gives up the literal truth of the primeval e narratives; and, in professing to indicate a short and easy method of confuting Tindal, lays principa on the indispensableness of Christianity as a main social order. This was to resign nearly everythin divines of the Waterland stamp thought worth def Middleton was warmly assailed from many quarte retreated with some difficulty under cover of a s apologetic pamphlets, and a more regular attenda church. A freethinker in the strict sense of the t certainly was, but how far freedom of thought was by him it is not easy to ascertain. His adversaries of them men who gravely maintained that E civilization originated in the age of Solomon—were to fix any serious imputation upon him; on the oth it is clear that the natural attitude of his mind t supernatural pretensions was one of suspicion, and t temperament was by no means devout. That nevertheless not incapable of a disinterested hero was exceeded by his next important publication, the but partial *Life of Cicero* (1741), a work which, below the standard of modern exactness, may yet c in spirit and execution with the best productions Italian Renaissance. It is, indeed, as remark Forsyth, "rather an historical composition, in Cicero is the principal figure, than the portrait of t himself"; and Dr Parr has pointed out Mid unacknowledged obligations to the forgotten Belle which, however, with the ardour of a discoverer, h to have considerably overrated. The work was und at the instance of Lord Hervey, in correspondenc whom also originated his disquisition on *The Senate*, published in 1717. The same year and the ing produced the most important of all his writi *Introductory Discourse* and the *Free Inquiry* con the miraculous powers then commonly deemed t subsisted in the church after the apostolic age. I bating this belief Middleton indirectly established t positions of capital importance. He showed that a tical miracles must be accepted or rejected in th and he distinguished between the authority due early fathers' testimony to the beliefs and practices times and their very slender credibility as witn matters of fact. Some individual grudge seems prompted him to expose, in 1750, Bishop Sh eccentric notions of antediluvian prophecy, which h been before the world for a quarter of a century same year he died of a decline at his seat at Hilde Cambridgeshire, leaving a widow, but no children.

Middleton's most ambitious work is obsolete from no his, but his controversial writings retain a permanent plac history of opinion. In his more restricted sphere he may appropriately be compared to Lessing. Like Lessing's, the of his intellect was captious and iconoclastic, but redeem mere negation by a passion for abstract truth, too apt to until called into activity by some merely personal stimul diction is generally masculine and harmonious. Pope thou and Hooke the only prose writers of the day who deserv cited as authorities on the language. Parr, while expo plagiarisms, heaps encomiums on his style. But his best his impatience of superstition and disdain of mere authority, are rather moral than literary. As a scholar he elegant than profound; as a controversialist he has more vig urbanity, and more wit than humour. He has been attacked both as author and as man by De Quincey, who accuses his style of colloquialism, and taxes him with ea church's bread while denying her doctrines. In fact Mi private means were ample, his ecclesiastical emoluments and his candour obstructed his path to much more conside ferment. The best general view of his intellectual chara influence is to be found in Leslie Stephen's *English Thoug Eighteenth Century*, chap. vi. A handsome edition of hi containing several posthumous tracts, but not including *of Cicero*, appeared in 1752.

MIDDLETON, Thomas (*c.* 1570–1627), held a place among the dramatists of the reign of James

popularity would seem to have first come to a height about 1607. This is a fair inference from the fact that in this and the following year a whole swarm of comedies from his pen were licensed and published—*A Trick to Catch the Old One*, *The Family of Love*, *The Phœnix*, *Michaelmas Term*, *Your Five Gallants*, *A Mad World My Masters*. Only the first of these kept the stage after the author's own generation, though in point of wit and constructive skill it is not superior to *The Phœnix* (a serious comedy) or *Your Five Gallants* (a bustling and gaily humorous farcical comedy). The plot of the *Trick* bears a family likeness to that of Massinger's *New Way to Pay Old Debts*; the titles in fact might be interchanged. A ruined scapegrace outwits his creditors and a usurious uncle by coming to town with a courtesan and passing her off as a widow with a fortune, whom he treats with deferential friendship, but hardly dares to love, ruined and hopeless as he is. His uncle lends him money that he may woo in proper state: his creditors also intrigue to have the honour of supplying him with all the needs of fashion; and the lady receives many costly presents from aspirants to her hand and fortune. Though Middleton was apparently not in high popularity till 1607, he had made his debut as a satirist ten years before; and if Malone is right in his conjecture that the *Mayor of Queensborough* is identical with the *Randall Earle of Chester* mentioned by Henslowe in 1602, he had done dramatic work of a much higher kind. Like *The Changeling*, a later production, in which Middleton had the assistance of Rowley, the tragedy of the *Mayor* is named after a character in the insignificant comic underplot. Such a title scares away readers weary of half intelligible Elizabethan fun and satire; but Simon the comic mayor is a very subordinate figure in the play, and the tragic portions alike in situation, characterization, and language rank among the very noblest productions of the Shakespearian age. There are scenes in the *Changeling* also which Mr Swinburne, with a judgment that will not be disputed, assigns to Middleton, unsurpassed for intensity of passion and appalling surprises in the whole range of Elizabethan literature. The execution of these scenes is far beyond any power that Rowley showed in single handed work, but well within the scope of the author of the *Mayor of Queensborough* and *Women Beware Women*. This last play, in which every one of the characters important enough to be honoured with a name perishes at the end in a slaughter so rapid as to be somewhat confusing, was apparently one of Middleton's later works, and the simple and measured development of plot in the first acts seems to show traces of the influence of Massinger. Middleton's verse, when charged with the expression of impassioned love, contains many echoes of the verse of *Romeo and Juliet*, as if his ear had been fascinated by it in his youth. His language generally proclaims him an admiring disciple of Shakespeare's; and in daring and happy concentration of imagery, and a certain imperial confidence in the use of words, he of all the dramatists of that time is the disciple that comes nearest the master. *The Witch*, by which Middleton's name has of late been linked with Shakespeare's in groundless speculation as being part author of *Macbeth*, is by no means one of Middleton's best plays. The plot is both intricate and feeble, as if the play had been written with a view to the half-comic spectacular exhibition of the witches, with their ribald revelry, their cauldrons, hideous spells, and weird incantations. Charles Lamb's comparison of Middleton's witches with Shakespeare's is one of the most exquisite morsels of criticism; but, when he says that Middleton's witches are "in a lesser degree fine creations," he ought perhaps to have added that they are merely embodiments of the vulgar superstition, put on the stage to excite laughter rather than fear among a half believing au an audience ready to laugh at them in the light m crowded meeting, whatever each might do in th alone. That Middleton had any share in *Macbe* conjecture resting solely on the fact that the words of the song of the witches about the caul Shakespeare's *Macbeth* occur also in the incantation a cauldron in the last act of Middleton's *Wit* that Middleton's song was inserted by Davenant "amended" reproduction of *Macbeth*. If either h the words of this song from the other, that is no of further co-operation; besides all that is common two was probably as much public property as a rhyme. There is no evidence as to whether *The* appeared before or after *Macbeth*. Middleton co-o with Dekker in the *Roaring Girl*, with Rowley in *Quarrel*, *The Spanish Gipsy*, and *The Changelin* with Jonson and Fletcher in *The Widow* (one of of Middleton's plays reproduced after the Resto Towards the close of his life Middleton got into dif with the privy council from writing a very clever play apropos of Prince Charles's unsuccessful wooing Spanish infanta in 1623. The chief personages in politics and their manœuvres were represented wi ingenious skill in the pieces and movements of *A G Chess*. This play was stopped by royal authority, prosecution of the author was allowed quietly t The few unimportant facts known in Middleton's history are collected in Mr Dyce's admirable editio plays. He enjoyed the office of city chronologer, a often employed to write pageants and masques, in c at least contracting for the whole exhibition, besi nishing the words. He died in 1627, and was b Newington Butts.

MIDDLETOWN, a city and port of entry United States, and one of the shire towns of Mi county, Connecticut, lies on the right bank of th necticut river, about 30 miles from its mouth, direct site the well known Portland quarries, and 24 mil New Haven by rail. Built on ground rising gent the river, with its principal streets keeping the dire the valley, and the cross streets climbing the slope, town is a place of considerable attractiveness, and th from the higher points are particularly fine. Wate with the wharves and shipping, Main Street, w commercial houses and hotels, and High Street, v mansions and gardens and trees, are the leading the city. On the high grounds behind stand the ha buildings of the Wesleyan (Methodist Episcopal) Uni The institution, mainly organized by Wilbur Fisk was chartered in 1831. To the two buildings with it started have been added Rich Hall, with the li about 30,000 volumes, Judd Hall, with scientific co of great value, the Memorial Chapel, erected centenary year of American Methodism, and the C tory Hall. Since 1872 the courses of the univers been open to both sexes. In 1882 the number fessors was 20, and of students 191, including 14 The Berkeley Theological School (Main Street), by the Episcopal Church in 1851, had in 188 fessors and 41 students, with a library of 17,000 A hill 1¼ miles to the south east of the city is occ the State General Hospital for the Insane, the building having a frontage of 768 feet, and the extending to 230 acres; and on another hill to th west of the city stands the State industrial school f As vessels drawing 10 feet of water can reach its Middletown carries on a considerable trade by the r 1882 1613 vessels, with a burden of 240,000 tons, the port, and 1613 vessels, with a burden of 350,0

; and the Middletown district owned 83 sailing and 22 steamers. Both the silver and the lead which were formerly worked in the vicinity have abandoned, but cast iron, britannia, and silver plated sewing-machines, pumps, webbing, and tape are the local manufactures. The population of the city ed from 5182 in 1860 to 6850 in 1880. First in 1636, Middletown was incorporated as a town in and as a city in 1781.

DDLETOWN, a manufacturing village of the United in Wallkill township, Orange county, New York, N.N.W. of New York, at the junction of four ds. It is a clean well built place, in the midst of a ary farming and stock raising district, manufactures files, felt hats, blankets, agricultural implements, s' materials, &c., and is the seat of the State opathic Insane Asylum. The population was 6049 0 and 8191 in 1880.

DHURST, an ancient parliamentary borough and town of Sussex, is picturesquely situated on a eminence above the south bank of the West Rother, e railway lines, 50 miles south west of London and th from Chichester. The church of St Denis (re in 1881–83) is chiefly Perpendicular in style, but er part of the embattled tower is probably Norman. grammar school, founded in 1672, Richard Cobden r Charles Lyell were educated. A new public hall ened in 1882. The old castle of the De Bohuns on a mound above the river, now overgrown with In ancient times a commandery of the Knights of n of Jerusalem had jurisdiction over the district rming the liberty of St John. The prosperity of n depends chiefly on agriculture. A market is held , and a fair three times a year. The population of liamentary borough, which has an area of 26,172 was 6753 in 1871, and 7221 in 1881.

urst is not mentioned in Domesday, being included under me. In the reign of Henry I. it was held by the king nor barony. In the time of Edward I. it passed into session of the De Bohuns. From the time of Edward II. it returned two members to parliament, but since then .

DIAN was one of the peoples of North Arabia whom ebrews recognized as distant kinsmen, representing as sons of Abraham's wife Keturah. The word ah means "incense"; thus the sons of Keturah are ncense men," not indeed inhabitants of the far south land, but presumably the tribes whose caravans t the incense to Palestine and the Mediterranean So the Midianites appear in connexion with the d incense trade from Yemen (Isa. lx. 6), and with de between Egypt and Syria (Gen. xxxvii. 28, 36). time of the exodus the pastures of the Midianites, he branch of Midian to which Moses's father in-law or Reuel, or Hobab) belonged, lay near Mount (Exod. iii. 1, and Num. x. 29 *sq.* implies that the was at home in the desert of the wanderings. The s, who, in spite of their connexion with Amalek (1 xv. 6), had friendly relations with Israel, and ulti de with the tribe of Judah, are represented g. i. 16, iv. 11 as the kin of Moses's father-in-law. entites, however, can have been but one fraction of which took a separate course from their early ns to Israel.[1] The main body appear in Judg. vi. as erful Bedouin confederation, invading Canaan from stern desert, and ravaging the land as similar tribes done in all ages when Palestine lacked a strong

[1] admixture of Midianite element in Judah and the other tribes of Israel is confirmed by a comparison of the names of Midianite clans in Gen. xxv. 4 with the Hebrew genealogies n. ii. 46, iv. 17, v. 24; Gen. xlvi. 9;

government. With their defeat by Gideon and a defeat by the Edomites in the field of Moab, pr about the same time (Gen. xxxvi. 35), the recorded of Midian closes.

A place Midian is mentioned 1 Kings xi. 18, and in late the name lingered in the district east of the Gulf of 'Akab Eusebius knows a city Madian in the country of the Sarac Ptolemy places Modiana. Still later Madyan was a station pilgrim route from Egypt to Mecca, the second beyond Aila Here in the Middle Ages was shown the well from whic watered the flocks of Shoʻaib (Jethro), and the place is still as "the caves of Shoʻaib." It has considerable ruins, whi been described by Ruppell (*Reisen*, 1829) and Burton (*Midian*, 1879).

MIDNAPUR, a district in the lieutenant-govern of Bengal, India, between 21° 37′ and 22° 57′ N. la between 86° 35′ 45″ and 88° 14′ E. long., is boun the N. by Bánkurá and Bardwán, on the E. by H and Howrah, on the S. by the Bay of Bengal, and W. by Singbhúm and Mánbhúm, with an area o square miles. Its general appearance is that of open plain, of which the greater part is under culti In the northern portion the soil is poor, and there wood. The country along the western boundary, as the Jungle Mahals, is undulating and pictures is almost uninhabited. The eastern and south- portions are swampy and richly cultivated. Th rivers of the district are the Hooghly and its three taries, the Rupnarayan, the Haldi, and the Ra The Midnapur high-level canal runs almost due e west from the town of Midnapur to Ulubariá Hooghly 16 miles below Calcutta, and affords a con navigable channel 53 miles in length. There a tidal canal for navigation, 26 miles in length, ing from the Rúpnáráyan river. The jungles west of the district yield lac, *tasar* silk, wax, resi wood, charcoal, &c., and give shelter to large an game.

The census of 1872 returned the population of Midn 2,540,963 (1,257,194 males and 1,283,769 females), includ 122 Europeans and 157,030 Mohammedans. The aborigin belong chiefly to the jungles and hills of Chutiá Nágpur kurá; the most numerous of them are Santáls (96,921) and (35,344). Of high-caste Hindus the returns show 136,500; number of Káyasths is given as 101,663. Among the semi ized aborigines, the most numerous are the Bágdís, a tribe vators, fishermen, and day-labourers (76,825). Belonging cultural castes there are 1,018,686. The four municipal Midnapur (31,491), Chandrakona (21,311), Ghatal (15,4 Tamlúk (5849). Rice is the staple crop. Irrigation is chiefly from the high-level canal. Rent rates vary from acre for the poorest quality of rice land to 18s. an acre for irrigable lands. The district suffers occasionally from floods are common, and very disastrous in their results. T cipal exports are rice, silk, and sugar; and the chief impo sist of cotton cloth and twist. Salt, indigo, silk, mats, and copper utensils are manufactured. Apart from the rive munication is afforded by 482 miles of road. The total re 1870–71 was £262,578, and the expenditure £53,777. vailing diseases are fever, diarrhœa, dysentery, and chole average mean temperature is 80° Fahr., and the average rainfall 66 inches.

The early history of Midnapur centres round the ancient Tamlúk, which in the beginning of the 5th century was an ant Buddhist settlement and maritime harbour. The f nexion of the English with the district dates from 1760, w Kasim ceded to the East India Company Midnapur, Chi and Bardwán (then estimated to furnish one-third of th revenue of Bengal) as the price of his elevation to the t Bengal on the deposition of Mír Jafar.

MIDNAPUR, chief town and headquarters station above district, is situated on the north bank of th river, with a population in 1872 of 31,491. The to a large *bái ár*, with commodious public offices. It is h dry, and well supplied with water. An American maintains an excellent training school, together printing press, and has founded several village sch

rict. Its efforts have been particularly successful the Santáls, and some of the earliest and most e works on their language have issued from the our mission press. A brisk manufacture of brass per utensils takes place in the town; it is also the of a large indigo and silk industry.

RASH. Like all nouns of a similar form *Midrash* equivalent of the Niph'al participle,[1] and as such as many modified meanings as the root *Darash* to search, &c., itself has. The practical significa- however, of *Midrash*, taken in historical order, are ows: (1) a book of records; (2) a recension of especially historical, materials; (3) search in and ation of the Scriptures, notably the Pentateuch (in ase the plural is invariably *Midrashoth*); (4) theory nguished from practice; (5) a college for study ching; (6) an *Agadic* (that is, a free) explanation, radistinction to an *Halakhic* one; (7) a collection free explanations (in which case the plural is *him* and occasionally also *Midrashoth*). Of these ignifications (1) and (2) are to be found in the Bible,[2] (4) are mentioned for the first time in the *Mish-* 5) is to be met with in the *Midrash*,[4] while (6) and to be found in early Rabbinic writings.[5]

subject of this article will be (1) the nature of *sh* in the sense of *Agadah*, to the exclusion of *ah* (for which see MISHNAH), and (2) the develop- f this *Midrash Agadah* into books (*Midrashim*).

thinking reader of the Scriptures cannot have failed rve that by the side of their ceremonial element, be tive or affirmative, permissive or jussive, there is en to be met with (and sometimes so as to be inspar- om it) a spiritual element. This spiritual element hiefly on feeling or emotion, and produces pious only indirectly. Now the explanation or application element, either by the Scriptures themselves or by bbis, is traditionally called *Midrash Haggadah* ion, preaching) or *Midrash Agadah*[6] (binding the God and all that is godly).

Haggadah or *Agadah* varies considerably both in and form. In its nature it sometimes humours, at imes threatens; it alternately promises and admon- ersuades and rebukes, encourages and deters. In it always consoles, and throughout it instructs and s. In form it is legendary, historical, exegetic, c, theosophic, epigrammatic; but throughout it is varied as was and is the *Midrash Agadah*, so varied been its fortunes. Whilst at times it stood very the estimation both of the teachers and the con ons in Israel,[7] it sank at other times very low .[8] Nay, at one and the same time, whilst some rabbis exalted it to the skies,[9] other rabbis trea with hatred,[10] or, worse still, with contempt.[11] Ther actually been teachers whose treatment of it differe the difference of the occasion.[12] The fact is the liked or disliked the *Midrash Agadah* according t political condition on the one hand and their pro to Jewish professors of Christianity on the other. hour of prosperity the Jews preferred the *Halak* in that of adversity they ran to hear the consoling of the *Agadah*.[13] When near Judæo-Christians, religious strength and argument chiefly rested on *Ag* the Jews disliked it: when among themselves, or dwelling among Gentiles (heathen or Christian), showed their wonted partiality for it.

But, whatever were the likings or dislikings of th for the *Midrashoth*, it is certain that these tradition early[14] committed to writing, and formed into volumes, known as "Books of *Agadah*."[15] Such we some of the *Targumim* and then the *Midrashim*. A writing down the traditional explanations of the ceremonial there existed a distinct law,[16] which was ob down to near the end of the 6th century. At an period isolated disciples only, in order to refresh memory, wrote down short Halakhic notes, which ever, they kept in secret.[17] The *Targumim* and *Midr* on the other hand, were composed very early and numerous, while their extensive contents were cir in public.

The *Midrash*, from whatever point of view it m regarded, is of the highest value. It is of the h value, of course, to the Jew as Jew first, inasmuch finds there recorded the noblest ideas, sayings, and ings of his venerable sages of early times. In th place it has value to the Christian as Christian, sin by these ideas, teachings, reasonings, and descriptio the beautiful sayings of the Founder of Christiani reasonings of the apostles, and the imagery of the s but enigmatic Apocalypse be rightly understood. importance appeals also to the general scholar, bec the inexhaustible mines of information of all kinds tains. The philologist will find here numerous hints eography and grammar, chiefly, of course, of the S languages, but also of other tongues, notably Gree Latin. The historian will gather here a rich har geography, chorography, topography, chronology, matics, &c. The philosopher will find here abunda

the ancient "I gather understanding" (cxix. 100) -
nd here valuable information on ancient ethnography
full sense of the term politics, political economy,
ilitary science naval affairs, &c. The true scholar
nd out by the study of the *Aggadah* that many a dis
y thought to belong to a recent age was well known
se ancient divines.

sources of the *Aggadah* are five: (1) the *Targumim*
specially those on the Prophets and Hagiographa;
non-canonical *Midrash* (*Mathnitha Boraitha*, see
SAID), which contains many valuable pieces, the age
ich is often anterior, in essence if not in form, not
those contained in the canonical *Mishnah*, but
the writings of the New Testament; (3) the canonical
lly recognized *Mishnah*, which contains several
treatises of an *Aggadic* nature, as *Aboth*,[1] *Middoth*,
nd numerous pieces scattered here and there among
alakhah; (4) both *Talmudim*[2] (the Palestinian and
nian), which have thousands of Aggadic notices
er ei in their *Halakhoth*; and (5) the *Midrashim*,
oxime. It is of the last alone, as represented by their
al collection, that we give an historical enumeration

Seder Tannaïm is an historical *Midrash* consisting of
Peraïm, and is called so on the principle of *locus a non*
, seems that in it are enumerated the days of the year on
a Jew must not fast. The Aramaic part of it alone consti-
he real *Megillah*, and belongs to the beginning of the 2d
n century.[4] The *editio princeps* came out at Mantua, 1513.
t cheap editions have been printed at Warsaw and elsewhere.
phar Yezirah is a philosophico-cabbalistic *Midrash* divided
x *Perakim*, which, in their turn, are subdivided into
nyoth. It is variously ascribed to the patriarch Abraham
R. 'Akibah, the illustrious teacher, who suffered martyrdom
Hadrian. To this rabbi the book, no doubt, belongs both in
ce and form.[5] It has gone through numerous editions, the
being of 1562 (Mantua, 4to), and has been translated into
German, and English (New York, 1877).
Othiyyoth de Rabbi 'Akiba is a *quasi*-cabbalistic *Midrash* on
habet, belonging, in essence if not in form, to the aforesaid
and in style. *Ed. prine.*, Constantinople, 1520, 4to.
Massekheth Hekhaloth is an astronomico-cabbalistic *Midrash*
Peraïm. It is ascribed to R. Yishmael the high priest.

valuable edition of this treatise (in Hebrew and English) has
blished by Dr C. Taylor, Cambridge, 1878.
these we may add, for the sake of convenience, although they
strictly speaking, belong to the canonical *Mishnah*, the *Perak*
lor and the Aggadic parts of the *Massekhtoth Ketannoth*.
collections of Talmudic *Aggadoth* were made early in the 16th

(1) *Haggadath Hattalmud*, Constantinople, 1511, folio, of
pparently only five copies are in existence, the finest of these
being in the University Library of Cambridge, and (2) *Ein*
Ya'akob, of which numerous and cheap editions exist,
prin. being that of Salonika, 1516-22.
must at once be stated that the latest critics have said concerning the age of
our *Midrash Rabboth* and *Midrashim* will have to be unsaid. Not
merely are these statements difficult of proof; in this case the reverse
is demonstrable. We shall only give two examples. The statement
Yerushalmi Bikkurim cannot be early, as Rashi did not know of it,
nowhere mentioned it," is doubly incorrect: Rashi *does* quote
on Hagigah 14 *a*. On the statement "We must not omit to
that no early Jewish commentator—Rashi, Ibn Ezra, &c.—
s the Targum either to Proverbs or to Job and Psalms, Nathan
hiel (12th century) is the first who quotes it," contains a *re-*
ad absurdum. For Nathan b. Yehiel was, as is well
a somewhat older contemporary of Rashi (*ob.* 1105), and lived
undred years before the Ein Ya'akob.

T. B., *Sanhedrin*, 65*b* and 67*a*. In the former place it distinctly
of the *Sepher Yezirah* (ספר יצירה), and, although in the
ter it speaks of the *Hilekhoth Yetsirah* (הלכות יצירה), there
be a doubt that *Sepher* (ספר) and *Hilekhoth* (הלכות) are
entical. Moreover, *Mishnayyoth* and *Halakhoth* are, in a cer-
n e, convertible terms (see MISHNAH); and our book (as
ed above) consists of *Mishnayyoth*.

Judging from internal evidence on the one hand, and from
known of R. Yishma'el in the *Talmudim* and *Midrashim*
Berakhoth, 7*a* and elsewhere) on the other hand, there see
no valid reason for doubting that he is the author of this s
sublime book. This *Midrash* is printed in the collectio
Lebanon (Venice, 1601, 4to) under the title of "*Pirkê Hek*
and "*Massekheth Hekhaloth*," and a MS. of it is preserve
University Library of Cambridge (Dd. 10. 11. 7. 2). Th
however, called "The Greater and the Lesser *Hekhaloth*,"
Peraïm, printed in this century, somewhere in Poland, c
besides the ancient literature, a good deal of matter whi
much later date.

(5) *Seder 'Olam* (the Greater and the Lesser) are two h
Midrashim, the former of which belongs to the 2d century
the latter (which is a mere extract of the former) belongs
age indeed (the Gaonaic). They have been repeatedly
always together, the *ed. prine.* being Mantua, 1513, 4to.

(6) *Haggadah shel Pesah* is a liturgical *Midrash* of the m
the 2d century, as far as its main portions go. It exists
three principal and several minor recensions in accordance
various rituals (see MAHZOR), and is recited at the domesti
of the first two Passover evenings. The editions are too n
to be mentioned, the *ed. prine.* being Constantinople, 1505

(7) *Megillath Antiokhos* treats ostensibly, as its name i
of the sufferings of the Jews under Antiochus Epiphanes, a
deliverance from his tyranny, but in reality of their sufferin
Hadrian and their deliverance under Antoninus Pius. The
text, with the exception of a few interpolations, belongs to th
of the 2d century. This little "roll" was for the first time p
by Filipowsky (London, 1851, 32mo). A MS. copy of the
is preserved in the University Library of Cambridge (Dd.

(8) *Zohar* (*Midrash Hazzohar*, *Midrasho shel Rabbi Sh*
Yohai, *Midrash Yehi 'Or*, &c.) is a cabbalistic *Midrash* on
Pentateuch, Canticles, Ruth, and part of Lamentations. It is v
ascribed to the famous R. Shim'eon (disciple of R. 'Akibah,
to R. Moshch b. Shemtob of Leon (a second-rate cabbalis
time of Nahmanides and Ibn Addereth). The *Zohar*
strictly speaking, to neither of these, whilst, in a certai
it belongs to both. The fact is: the nucleus of the bo
Mishnic times, and R. Shim'eon b. Yohai was the autho
Zohar in the same sense that R. Yohanan was the autho
Palestinian Talmud, *i.e.*, he gave the first impulse to the
tion of the book. But R. Moshch of Leon,[6] on the other ha
the first not only to copy and disseminate the *Zohar* in
but also to disfigure it by sundry explanatory interpolation
more details see Lumby, "Introduction to the Epistle of J
the *Speaker's Commentary*, vol. iv. p. 388. The first two
of the *Zohar*[7] on the Pentateuch came out simultaneously (
1558-60, 4to, and Cremona, 1558, folio), and the *ed. pr*
Canticles, Ruth, and part of Lamentations came out at
(1597, 4to). The best, though by no means critical, edition
Pentateuch is that of Brody, 1873, 8vo. Of translations,
they are, there exist those of Knorr v. Rosenroth, *Kabbala d*
(vol. i., Sulzbach, 1677, and vol. ii., Frankfort, 1684, 4
Tholuck, *Wichtige Stellen*, &c. (Berlin, 1824, 8vo), &c.[8]

(9) *Pesikotho*[9] (commonly, but by mistake, called
derab Kohana is a homiletic *Midrash* consisting of th
Peskhoth for the principal festivals and fasts, and the hist
noted sabbaths and other days. It is of the end of the 3
beginning of the 4th century. Having been but rarely
since the 12th century, so that most scholars knew of

[6] R. Moshch of Leon is a fair sample of the mediocrity of
in cabbalistic lore, and combined, as is usual, with his medio
illimitable vanity; see MS. Dd. 11. 22 (Cambridge University L
leaf 2*a*: "And I adjure every one who should deeply study th
or who should copy it, or read it, that he do not blot out n
from my property (inheritance), for I have composed it. . . .
statement alone would suffice to prove that R. Moshch of Le
never have ascribed a book composed by himself to anybody el

[7] The *Zohar*, cleared of the main works by which it is surr
and of the interpolations by which it has been disfigured bot
first European copyist and by others down even to our own d
begun in Palestine late in the 2d or early in the 3d centu
finished, at the latest, in the 6th or 7th century. It is im
that it should have been composed after that time and be
Renaissance, as both language and contents clearly show.

[8] Whilst the principal editions of the many textual extrac
from the *Zohar* (as the *Iddroth*, &c.) need not be specified he
of the following supplementary and kindred works ought to
tioned:—(1) *Tikkune Hazzohar* (*ed. prine.* Mantua, 1557, 4
(2) *Zohar Hadash* (*ed. prine.* Cracow, 1603). Nor should the
mesephet Hazzohar, *Hibbure Tinyono* (by the otherwise very
Yitshak b. Moshch of Satanow) be passed over. It is a mere i
of the *Zohar*,—an imposition of a kind which is a disgrace to li

under MISHNAH.

ly, it was long considered lost, till, in 1868, Salomon Buber berg, a man of learning, wealth, and love for the ancient re of his nation, edited it from four MSS., one of which y in possession of Carmoly) is now preserved in the Uni- Library of Cambridge (Add. 1497). The printed edition d at Lyck, 8vo.

Pesikta Rabbathi, consisting in the latest edition of eighty- *koth*, is a *Midrash* of the same nature, and, in its main part, of the same date, as (9). Both drew from the same sources. *idrash* has been edited five times,—the latest, best, and edition being that of Friedmann (Vienna, 1880, 8vo).

Yenna debe Eliyyahu consists of two parts, the Greater and the Lesser (Zutto),—the former in thirty-one and the twenty-five *Perakim*. It is an exegetical *Midrash*, the which is already known to the *Bereshith Rabbah* (c. lxv.) Babylonian Talmud (*Kethuboth*, 106*a*). It is only un criticism that can declare it a Gaonaic work, although, like r old books of the Jews, it is not without later additions. ue., Venice, 1598, 4to. There are modern and cheap Polish

Midrash Rabbah (רבה) or *Rabboth* (רבות) is chiefly an al and homiletical *Midrash* on the Pentateuch and the Rolls" (*Hamesh Megilloth*, *i.e.*, Canticles, Ruth, Lamenta- Ecclesiastes, and Esther). It is called *Rabbah* either from d (the first distinctive) word of its beginning (רבי הויצי) or from its being the most voluminous- *rash*; hence bbo (רבא). The *Midrash* on Canticles (a nd then also called *Midrash Hazitha* (from rd of the beginning חזית). These ten *Mi* , of various styles and ages; yet no of the excepted, later than the beginning of kable that, although the *Megilloth* the arly l to the Pentateuch (since they were to the 10th and still are, read through the synagogal yea l is the Pentateuch itself), the *Rabbath* hac *inceps*[3]—that on the Pentateuch appearing for the first tim

Rabbah on Genesis has 100 *Parshaioth*, that on Exodu Leviticus 37, that on Numbers 23, and that on Deutero se five *Midrashim* are quoted according to their chapter . The n Canticles accommodates itself to the sacred text, and i cordingly. Ruth has 8 *Parshaioth*, and i oted Lamentations has 1 chapter consisting of introductions *tho Dehakkime*), accommodating itself, for the rest, to the xt. Ecclesiastes has 3 *Sedarim*, and Esther h *Parshaioth*, ous times various modes of quotin *idrashim* are —the most common and most expedient, how er, being that g them according to the verses of the Bible. might with advantage be mentioned some pie of literature e kindred in nature, although some of the are of much ate, whilst others are much later, than the *Midrashim* tioned:—(1) *Agadath Bereshith* on Genesis, ighty-three —edited for the first time by R. Menal. Lonsano in hi *adoth*, Venice, 1618, 4to; (2) *Midrash Vayyosa'u* on Ge in one chapter,—to be found in Jellinek's *Bet ha-Midrasch*, 1855, 8vo; (3) amplifications of chap lxx. of *Mi* on Genesis xxviii. 22, by the incorporation of the v hon *Tobit* in Aramaic, &c. (see *The Book of Tobit*, 1878, 8vo); (4) *Midrash Vayyosha'* on Exodus xiv. 30, printed at Constantinople, 1519, 4to; a MS. of this *Midrash* ved in the University Library, Cambridge (Add. 854); (5) *'Asereth Haddibberoth* on Exodus xx.,—printed in Jellinek's *Midrasch*, Leipsic, 1853, 8vo; (6) *Midrash Petirath Aharon* ers xx. 23-29; (7) *Midrash Petirath Mosheh* on Deuteronomy 8) *Midrash Abbo Gorion* on Esther; the last three are to be the before-mentioned *Bet ha-Midrasch*; (9) *Midrash Shemuel*, d, from its beginning, *'Eth la'asoth Ladonai*, Constantinople, io; (10) *Midrash Yonah*, Prague, 1595, 4to; (11) *Midrash Tehillim*), 1512; (12) *Midrash Mishele*, 1517, the last two ed at Constantinople, and in folio; (13) *Sepher Hayyashar* a good many old traditions are preserved, although it is , not the one mentioned in various books of the Bible), 1625, 4to; (14) *Dibere Hayyamim shel Mosheh*, Constanti- 516, 4to; a fragment of this is to be found in MS. Add. the University Library of Cambridge; (15) *Yosephon* (or), various works of Flavius Josephus worked up rather freely, 1480, folio,—translated into Latin (German and Spanish) imes; (16) *Zerubbabel*, Constantinople, 1519, 8vo; (17) *Elleh* on the "Ten Martyrs." For several other smaller *Midrashim* ek's *Bet ha-Midrasch*, i. and ii., 1853, iii., 1855, iv., 1857, ipsic; v., 1873, and vi., 1877, both at Vienna; and comp. rowitz, *Sammlung Kleiner Midraschim*, i., ii., Frankfort. The *Midrashim* on Isaiah and on Job seem now irretriev

f to compensate for this drawback, the well-known Cornelio d brought out at Venice, in 1545, two editions of the *Rabboth* entateuch and *Megilloth*, the one at Bombergi's house and the

in 1512 (Constantinople, folio), and that on the *Megilloth* in (somewhere in Italy, במדינת איטליאה, also in folio).[4] The and best edition is that of Vilna, 1880, folio. A translatio German is now coming out at Leipsic, by Dr A. Wunsche.

(13) *Pirḳe de-Rabbi Eli'ezer* (also called *Boraitha de- Eli'ezer*) is an astronomico-theosophical *Midrash* consistin fifty-four *Perakim*. It goes through the so-called "eighteen dictions," the signs of the zodiac, &c., but is unfinished. It bel no doubt, to the 5th century. The fact that the name "Fat occurs in it is no proof whatever that the book is post Mohamme as that name must have been already known to the idolatrous A *Ed. prin.*, Constantinople, 1514, and with a Latin transla Leyden, 1644, both editions being in 4to. There are also to be found cheap editions (Lemberg, Warsaw).

(14) *Tanḥuma* is an exegetical and homiletical *Midrash* o whole Pentateuch. It is quoted according to the *Parshaioth* the week. Although originally of the end of the 5th or beginning of the 6th century, it has now two principal addit which form part of the book: (1) several of the *Shaelloth* of Aha'i Gaon (of the 8th century), and (2) several pieces of *Yesod* of R. Mosheh Haddarshan, of Narbonne (of the 11th cent On its relation to the "*Yelammedenu*" (often quoted in the century, but supposed to be lost) light will soon be thrown by before-mentioned Salomon Buber, who is now preparing a cr edition of it. The *ed. prine.* of the *Tanḥuma* is Constantin 1522, folio; and a very valuable MS. copy of it is in the bridge University Library (Add. 1212).

(15) *Bahir* is a small cabbalistic *Midrash* ascribed to the Mishnic teacher, R. Nehunyah b. Hakkanah,—no doubt its beginning with the words רבי נחוניה בן הקנה Nahmanide- (*ob.* 1268) quotes the book often in his commen on the Pentateuch, under the names of *Sepher Habbahir*, *Midrasho shel Rabbi Nehunyah b. Hakkanah*. Some have nounced this work a late fabrication, but others, who thoroughly studied it, justly describe it as "old in substan not in form." *1st prin.*, Amsterdam, 1651, 4to. A cheaper appeared at Lemberg (1865, 8vo), and a MS. of this work is served in the University Library of Cambridge (Dd. 10. 11. 4).

(16) *Yalḳut* is the only existing systematic (not exhau collection of the *Aggadoth* on the whole Bible. Its author drew only from most of the *Midrashim* named in this article, but from the *Boraithoth* (see Mishnah), both *Talmudim*, and Midrashic works now lost (as the *Abkhir*, *Hasshakhem Hashkem*, &c.).[5] This fact constitutes one of the principal p of its value. The author was R. Shim'eon, brother (and not of R. Hello, and father of the distinguished grammarian, critic divine R. Yoseph Kara. He lived somewhere in the north of F in the 11th century. The *ed. prine.* of the *Yalḳut* on Nehemiah, and the books of Chronicles came out at Venice, folio (in the first Rabbinic Bible), that on the Prophets Hagiographa in 1521, and that on the Pentateuch in 1526-27, at Salonika, and in folio. An English translation of the w work has been undertaken by a band of Rabbinic scholar Cambridge. The first instalment, "The Yalkut on Zechari by E. G. King, B.D., Hebrew lecturer of Sidney Sussex Col appeared in 1882. This specimen, besides giving a correct t lation, contains many valuable notes.

(17) *Leḳaḥ Tob* is a *Midrash* on the Pentateuch and the *Megilloth*, by R. Tobiyyahu b. Eli'ezer of Greece, who lived du the crusade of 1096. This work draws, certainly, upon the old well-known *Midrashim*, and as such it would have thorou deserved the censure passed upon it by the witty but some irreverent Abraham Ibn Ezra (in his preface to his commen on the Pentateuch). But the *Leḳaḥ Tob* has also most valu explanations both by the collector himself and by his fathe Eli'ezer), a fact passed over by Ibn 'Ezra in silence. The *L Tob* on Leviticus, Numbers, and Deuteronomy came out the first time at Venice, in 1546, folio, under the title of *Pe Zuttarto* (see leaf 93*b* in the postscript by the editor, פקיקתא זוטרתא, which explains the somewhat vague title on the page פסיקתא זוטרתא או רבתא). In 1753-54 it was re printed at Venice, with a Latin translation, by Blasius Ugo in his *Thesaurus Antiquitatum Sacrarum* (xv.-xvi.) under name of *Pesikta*. The *Leḳaḥ Tob* on Genesis and Exodus

other at Gustiniani's. These two editions differ in nothing b the title pages, &c., and the vignettes of the various books. former edition is in possession of Dr W. Aldis Wright, and the in that of Dr C. Taylor. The fact of these editions having app simultaneously is, apparently, unknown to the bibliographers.

[4] It is noteworthy that in this edition *Ahasherosh*, *i.e.*, Es stands between Lamentations and Ecclesiastes, with which latte *Midrash* on the *Megilloth* ends.

[5] We may mention here the *ed. prine.* of three cabbalistic-Midr collections which go under the name of *Yalḳut*:—(1) *Yalḳut Ha* Lublin, 1648, 4to; (2) *Yalḳut Reubeni Hakkatan*, Prague, 4to; and (3) *Yalḳut Reubeni Haggadol* Wilhermsdorf, 1681, fo

ed, with a critical commentary, at Vilna, by Salomon Buber
8vo), where also simultaneously a third edition of this
on the last three books of Moses, with a short commentary
ame out by Aharon Moshch Padova, of Carlin. The *Lekah*
the five *Megilloth* is as yet unpublished, there exist, how-
veral good MSS. of it, both in public and private libraries,
st copy in every respect being that preserved in the Un-
Library, Cambridge (Add. 398).

Menorath Hamaor is a valuable though incomplete,
n of the principal *Lekahs* of the *Talmudim* and
rim, by R. Yizhak Abohab the elder, flourished 13th century.
tions with and without translations, are very numerous,
rim being Constantinople 1511, folio. There are transla-
n Spanish, Judæo-German and German, but not in English.
ppend two specimens of *Midrashim*, the first from
a, leaf 12*a* and the second from *Midrash Shemoth Rabbah*,

[illegible] the Holy One (blessed be He!) sent to the Prophets to cover

MIERIS, the name of a family of artists who pr
painting at Leyden for three generations in the 17
18th centuries.

I. FRANS VAN MIERIS, the elder, son of Jan van
a goldsmith and diamond setter, was born, accord
Houbraken, at Leyden on the 16th of April 16
died there on the 12th of March 1681. His father
to train him to his own business, but Frans pr
drawing to chasing, and took service with Abraha
envlet, a glazier who kept a school of design. A
happens, the youth's style was influenced by his
surroundings. In his father's shop he became f
with the ways and dress of people of distinction
eye was fascinated in turn by the sheen of jewelle
stained glass; and, though he soon gave up the t
of Torenvliet for that of Gerard Dow and Abraha
den Tempel, he acquired a manner which had more
finish of the exquisites of the Dutch school than
breadth of the disciples of Rembrandt. It sho
borne in mind that he seldom chose panels of wh
size exceeded 12 to 15 inches, and whenever his
attached to a picture above that size we may surely
it to his son Willem or to some other imitator.
Gerard Dow when he first left Rembrandt, or Ja
when he started on an independent career, he nev
tured to design figures as large as life. Character
his art in its minute proportions is a shiny brightn
metallic polish. The subjects which he treated h
those in which he illustrated the habits or actions
wealthier classes; but he sometimes succeeded in
incidents and in portrait, and not unfrequently l
tured on allegory. He repeatedly painted the sati
which Terburg brought into fashion, and he often
Terburg in the faithful rendering of rich and

GNARD, PIERRE (1610–1695), called to distinguish
om his brother Nicholas Le Romain, was the chief
portrait-painter of the 17th century. He was born
yes in 1610, and came of a family of painters. In
he left the studio of Simon Vouet for Italy, where
nt twenty-two years, and made a reputation which
t him a summons to Paris. Successful with his
t of the king, and in favour with the court, Mignard
himself against Le Brun, declined to enter the
ny of which he was the head, and made himself the
of opposition to its authority. The history of this
le is most important, because it was identical, as
as it lasted, with that between the old guilds of
and the new body which Colbert, for political
s, was determined to support. Shut out, in spite of
served success of his decorations of the cupola of
Grace (1664), from any great share in those public

MIGNONETTE, or MIGNONNETTE (*fr.*, "little
ling"), the name given to a popular garden flowe
Reseda odorata of botanists, a "fragrant weed," as C
calls it, highly esteemed for its delicate but delicious per
The mignonette is generally regarded as being of a
duration, and is a plant of diffuse decumbent twiggy
scarcely reaching a foot in height, clothed with bl
lanceolate entire or three-lobed leaves, and bearing l
spikes (technically racemes) of rather insignificant f
at the ends of the numerous branches and bran
The plant thus naturally assumes the form of a low
mass of soft green foliage studded over freely wit
racemes of flowers, the latter unobtrusive and likely
overlooked until their diffused fragrance compels atte
The native country of the original or typical mign
has sometimes been considered doubtful, but accord
the best and latest authorities it has been gathered w
the North African coast near Algiers, in Egypt, a
Syria. As to its introduction, a MS note in the
of Sir Joseph Banks records that it was sent to E
from Paris in 1742; and ten years later it appears t
been sent from Leyden to Philip Miller at Chelsea. T
originally a slender and rather straggling plant, the
now some improved garden varieties in which the g
is more compact and vigorous, and the inflorescence l
though the odour is perhaps less penetrating. The
six petalled flowers are somewhat curious in structur
two upper petals are larger, concave, and furnished
back with a tuft of club-shaped filaments, which
them the appearance of being deeply incised, while t
lowest petals are much smaller and undivided; th
conspicuous part consists of the anthers, whic
numerous and of a brownish red, giving the tone of
to the inflorescence. In a new variety named
Queen the anthers have a decided tint of orange
which imparts a brighter golden hue to the plant
in blossom. A hand-some proliferous or double fl
variety has also been obtained, which is likely to be
useful decorative plant, though only to be propaga
cuttings, the double white flowers grow in large
panicles (proliferous racemes), and are equally fr
with those of the ordinary forms.

What is called tree mignonette in gardens is due to the
the cultivator. Though practically a British annual, as
noted, since it flowers abundantly the first season, and is
destroyed by the autumnal frosts, and though recorded a
annual in its native habitat by Desfontaines in the *Flora A*
the mignonette, like many other plants treated in Eng
annuals, will continue to grow on if kept in a suitable temp
Moreover, the life of certain plants of this semiannual
may be prolonged into a second season if their flowering and
are judiciously prevented. In applying these facts to
duction of tree mignonette, the gardener grows on the
plants under glass, and prevents their flowering by nippin
blooming tips of the shoots, so that they continue their ve
growth into the second season. The young plants are at f
ported in an erect position, the laterals being removed
secure clean upright stems, and then at the height of one
feet or more, as may be desired, a head of branches is en
to develop itself. In this way very large plants can be pro

For ordinary purposes, however, other plans are adopted.
open borders of the flower garden mignonette is usually
spring, and in great part takes care of itself, but, being a f
either for window or balcony culture, and on account of its f
a welcome inmate of town conservatories, it is also very ex

s a pot plant, and for market purposes with this object it is pots in the autumn, and thinned out to give the plants e space, since it does not transplant well, and it is thereafter y grown in pits protected from frosts, and marketed when iving at the blooming stage. In this way hundreds of ds, probably, of pot of blooming mignonette are raised and l of year by year.

mer scientific but it would appear less correctly, written ette. The genus *Reseda* contains some other interesting ful species, among them the *Reseda Luteola*, which is ly called dyer's weed and weld, and yields a valuable lye.

EL, MARIA EVARISTE (1802–1866), usually known MIGUEL, whose name is chiefly associated with his ion to the throne of Portugal, was the third son of ohn VI. of Portugal, and of Carlotta Joachima, one Spanish Bourbons; he was born at Lisbon on 26, 1802. In 1807 he accompanied his parents flight to Brazil, where he was permitted to grow oted child and a worthless youth; in 1821, on his to Europe, it is said that he had not yet learned l. In 1822 his father swore fidelity to the new ese constitution which had been proclaimed in his , and this led Carlotta Joachima, who was an st of the extremest Bourbon type, and otherwise er husband, to resolve to seek his dethronement in of Miguel her favourite son. The insurrections ensued (see PORTUGAL) resulted in her relegation to le of Queluz and the exile of Miguel (1824), who short time in Paris and afterwards lived in Vienna, e came under the teaching of Metternich. On the death of John VI. in May 1826, Pedro of Brazil, est son, renounced the crown in favour of his a Maria da Gloria, on the understanding that she become the wife of Miguel. The latter nominally swore allegiance to Pedro, to Maria, and to stitution which Pedro had introduced, and on the was appointed regent in July 1827. He arrived on in February 1828, and, regardless of his s, dissolved the new Cortes in March; having ogether the old Cortes, with the support of the ary party of which his mother was the ruling e got himself proclaimed sole legitimate king of d in July. The power which he now enjoyed he in the most tyrannical manner for the repression liberalism, and his private life was characterized wildest excesses. The public opinion of Europe more and more actively hostile to his reign, and occupation of Oporto by Don Pedro in 1832, the tion of Miguel's fleet by Captain (afterwards Sir) Napier off Cape St Vincent in 1833, and the ion of Santarem in 1834, Queen Christina recognized the legitimate sovereignty of Maria, the act followed by France and England. Don capitulated at Evora on May 29, 1834, renouncing ter ion to the Portuguese throne, and solemnly to never thereafter to meddle in Peninsular He lived for some time at Rome, where he was papal court, afterwards retired to Brompton Bodley, where he died on November 14, 1866.

ULINSKAYA, a village (*stanitsa*) of Russia, government of the Don Cossacks, and in the district Medyeditsa, 70 miles west of that town, on bank of the Don. It is one of the largest and est *stanitsas* of the government, and has 20,600 ants, who are engaged in agriculture and stock-ng, and in the export of agricultural produce.

ALLOVSKAYA, a Cossack village (*stanitsa*) of , in the government of the Don Cossacks, and in the district of Khopersk, 14 miles to the north-we Uryupino, on the low left bank of the Khoper, whi inundated when the river is full. It has an impo fair, where Tartars from Astrakhan exchange furs cottons for manufactured and grocery wares imported central Russia; the inhabitants of the district als corn, cattle, and plain woollen stuffs. Population, 18

MILAN (the Latin *Mediolanum*, Italian *Milano*, German *Mailand*), a city of Italy, situated near the m of the Lombard plain, on the small river Olona, in 45° 35″ N. lat. and 9° 5′ 45″ E. long. It is 390 feet a the sea level, and lies 25 miles south of the Alps at C 30 miles north of the Apennines, 20 miles east o Ticino, and 15 miles west of the Adda.

The plain around Milan is extremely fertile, owi once to the richness of the alluvial soil deposited b Po, Ticino, Olona, and Adda, and to the excellent sy of irrigation. Seen from the top of the cathedral plain presents the appearance of a vast garden di into square plots by rows of mulberry or poplar To the east this plain stretches in an unbroken as far as the eye can follow it, towards Venice an Adriatic, on the southern side the line of the Apen from Bologna to Genoa closes the view; to the west the Maritime, Cottian, and Graian Alps, with Monte as their central point; while northward are the Pe Helvetic, and Rhætian Alps, of which Monte Rosa Saasgrat, and Monte Leone are the most conspi features. In the plain itself lie many small vill and here and there a larger town like Monza or Sar or a great building as the Certosa of Pavia, makes a point upon the greenery.

The commune of Milan consists since 1873 of th within the walls (area 1513 acres) and the so-called Santi[1] without the walls (area 15,415 acres). The lation of the whole area increased from 134,528 in to 242,157 in 1861, 261,985 in 1871, and 321,8 1881,—the city within the walls contributing 110,8 1801, 196,109 in 1861, 199,009 in 1871, and 21 in 1881. The climate is very variable; there is a diffe of 41° Fahr. between the extreme summer heat and v cold. The average number of wet days is 72, a snowy days 10 per annum.

Milan is built in a circle, the cathedral being the c point. The city is surrounded by a wall 7 mil circumference, and immediately outside the wall a broad thoroughfare makes the circuit of the city. streets inside are for the most part narrow and croo the main streets are the Corso Vittorio Emanuel Strada S. Margherita, the Via Manzoni, the Corso Ticinese, and the Corso Porta Romana. There are piazzas of any size; the largest is the Piazza del Du which has recently been extended, and the houses a n modernized. To the west of the city is the open of the Foro Bonaparte and the Piazza d'Armi, wit square keep of the Visconti castle, flanked by two gr towers, between them. The castle was partly dest in 1447 by the Ambrosian republic, rebuilt by Fra Sforza, enlarged by the Spanish governors, and take Napoleon in 1800, when the outer fortifications were the second, and the walls left as they now are. of the Piazza d'Armi is the modern cemetery, with a s building and apparatus for cremation, erected in 187

Among the buildings of Milan the most important cathedral, begun under Gian Galeazzo Visconti, in It is built of brick cased in marble from the quarries Visconti gave in perpetuity to the cathedral chapter.

[1] The name Corpi Santi (of doubtful origin) is also applied extra-mural portions of Cremona and Pavia.

of the original architect is not known, but it is
n that many German master masons were called to
to assist the Italian builders. After St Peter's at
and the cathedral of Seville the Duomo of Milan is
argest church in Europe. It is 477 feet in length
83 in width; the nave is 155 feet high, the cupola
feet, and the tower 360 feet. The work was con
d through many centuries, and after the designs of
masters, notably of Amadeo, who carried out the
on cupola, and of Tibaldi, who ornamented the
and windows of the façade in the 16th century. The
was finished, under Napoleon, in 1805. The style

Features The district of Milan is renowned for its excellent
ture. It may be divided into two regions where different
s of farming are pursued and different crops produced. The
gion lies on the lower slopes of the Alps, where they sink
e plain. This is called the *alta Milanese*, for it is watered
nts only, which have worn themselves too deep a bed to
t irrigation, and the peasants are obliged to collect the rain
in large underground tanks (called *peppe*). The soil is for
t part thin and light, and frequently washed down the
into the plain, where it is only kept in its place by
all terraced walls. The farm-houses here are smaller than
lower plain, and the system of tenure is a compromise
the metayer system, but more akin to the latter, and
lease. The rent is paid partly in money, partly in kind or in a money equivalent,
nented by a certain number of the finest cheeses. In cases where
a fruit trees are scarce, the landlord supplies and maintains
till they come into bearing. The landlord carries out all
ements, and the tenant holds the land at his pleasure.
tation of copper coin for three years. The value of these
s is greatly appreciated by the peasants, who use them
ornaments. The latter produce more cereal wheat in abund
a little flax and millet, apples, and wine. The good
ural district that which lies in the plain, and is called the
me, from the abundance of irrigation which makes
adows yield a constant succession of crops. The plain is
d by numerous canals at various levels, crossing one
on bridges, or by culverts, so that the country is flooded
l at any moment. The system is said to date from the 12th
, but was improved by Leonardo da Vinci, and is now the
erfect network of irrigation in Europe. The rents vary in
from 1500 to 1500 per hectare. They are let upon leases for
selves, or fifteen years, at rents ranging from £5 to £12 10s
per hectare, while those near a city may bring from £15 to £20
The rotation of crops is over five years. The meadow yields
good grass in the year, the first three the second crop, the
, and the fourth the third cut, the fourth is ploughed up.

Totila destroyed the whole of Milan in 539; and hence
this city, once so important a centre of Roman civilization,
so few remains of antiquity. Narses, in his campaigns
the Goths, had invited other barbarians, the Lombards, to
They came in a body under Alboin, their king, in 568,
and were soon masters of North Italy, and entered Milan the year following. Alboin established his capital at Pavia, and Milan remained the centre of Italian opposition to the foreign conquest.

The Lombards were Arians, and the archbishops of Milan from the days of Ambrose had been always orthodox. Though the struggle was unequal, their attitude of resolute opposition to the Lombards gained for them great weight among the people, who felt that their archbishop was a power around whom they might gather for the defence of their liberty and religion. All the innate hatred of the foreigner went to strengthen the hands of the archbishops, who slowly acquired, in addition to their spiritual authority, powers military, executive, and judicial. These powers they came to administer through their delegates, called viscounts. When the Lombard kingdom fell before the Franks under Charles the Great in 774, the archbishops of Milan were still further strengthened by the close alliance between Charles and the church, which gave a sort of confirmation to their temporal authority, and also by Charles's policy of breaking up the great Lombard fiefs and dukedoms, for which he substituted the smaller counties. Under the centralized government of Charles's immediate successors the archbishop was the only real power in Milan. But there were two classes of difficulties in the situation, ecclesiastical and political; and their presence had a marked effect on the development of the people and the growth of the commune, which was the next stage in the history of Milan. On the one hand the archbishop was obliged to contend against heretics or against fanatical reformers who found a following among the people; and on the other, since the archbishops were the real power in the city, the emperor, the nobles, and the people each deemed that he should be of their party; and to which ever party he did belong he was certain to find himself violently opposed by the other two. From these causes it sometimes happened that there were two archbishops, and therefore no central control or no archbishop at all, or else an archbishop in exile. The chief result of these difficulties was that a spirit of independence and a capacity of judging and acting for themselves was developed in the people of Milan. The terror of the Hungarian invasion, in 899, further assisted the people in their progress toward freedom, for it compelled them to take arms and to fortify their city, rendering Milan more than ever independent of the feudal lord who lived in their castles in the country. The tyranny of these nobles drove the peasantry and smaller vassals to seek the protection for life and property, the equality of taxation and of justice, which could be found only inside the walled city and under the rule of the archbishop. Thus Milan grew populous, and learned to govern itself. Its inhabitants became for the first time Milanese, attached to the standard of St Ambrose,—no longer subjects of a foreign conqueror, but a distinct people, with a municipal life and prospects of their own. For the further growth of the commune, the action of the great archbishop Heribert, the establishment of the carroccio, the development of Milanese supremacy in Lombardy, the destruction of Lodi, Como, Pavia and other neighbouring cities, the exhibition of free spirit and power in the Lombard league, and the battle of Legnano, see the article ITALY. See also LOMBARDS.

After the battle of Legnano, in 1174, although the Lombard cities failed to reap the fruit of their united action, and fell to mutual jealousies once more, Milan internally began to grow in material prosperity. After the peace of Constance (1183) the city walls were extended, the arts flourished, each in its own quarter, under a guide who watched the interests of the trade. The manufacture of linen was the most important industry. During the struggles with the emperor Barbarossa, when freedom seemed on the point of being destroyed, many Milanese vowed themselves, their goods, and their families to the Virgin should their city come safely out of her troubles. Hence arose the powerful fraternity of the Umiliati, who established their headquarters at the Brera, and began to develop the wool trade, and subsequently gave the first impetus to the production of silk. From this period also date the irrigation works which render the Lombard plain a fertile garden.

The government of the city consisted of (A) a parlamento or concione, including all who possessed bread and wine of their own, which soon found to be unmanageable owing to its size, was reduced first to 2000, then to 1500, and finally to 800 members, (B) a credenza or committee of twelve members, elected in the great council, for the despatch of urgent or secret business: (C) the consuls, the executive, elected for one year, and compelled to report to the great council at the term of their office. The way in which the burghers used their liberty and powers, secured by the peace of Constance, in attacking the feudal nobility; how they compelled the nobles to come into the city and to abandon their castles for a certain portion of the year; how the war between the two classes was continued inside the city, resulting in the establishment of the podestà; and the nature and limits of this office,—all this has been explained in the article ITALY.

This bitter and well-balanced rivalry between the nobles and the people, and the endless danger to which it exposed the city owing to the fact that the nobles were always ready to claim the protec-

heir feudal chief, the emperor, brought t the front two milies as protagonists of the contending factions,—the of Valsassina, and the Visconti, who derived their name office they had held under the archbishops. After the Cortenova, in 1237, where Frederick II. defeated the Guelf he Milanese and captured their carroccio, Pagano della Torre nd saved the remnants of the Milanese. This act recom him to popular favour, and he was called to the government ty,—but only for the distinct purpose of establishing the ," a property tax which should fall with equal incidence on izen. This was a democratic measure which marked the which the Torriani belonged and rendered them hateful obility. Pagano died in 1241. His nephew Martino bl podestà in 1256, and in 1259 as signore of Milan, the e such a title was heard in Italy. The nobles, who had round the Visconti, and who threatened to bring Ezzelino ano, the Ghibelline tyrant of Padua, into the city, were by Martino, and nine hundred of their number were . Martino was followed by two other Torriani, Filippo ier (1263–65) and Napoleone his cousin (1265–77), as lords n. Napoleone obtained the title of imperial vicar from of Hapsburg. But the nobles under the Visconti had been gathering strength, and Napoleone was defeated at Desio. He ended his life in a wooden cage at Castel Baradello omo.

Visconti, archbishop of Milan (1262), the victor of Desio, lord of Milan, and founded the house of Visconti, who ruled except from 1302 to 1310 till 1447, giving twelve lords. Otho (1277–95), Matteo (1310–22), Galeazzo (1322–28), 328–39), Luchino (1339–49), and Giovanni (1349–54) fol- succession. Giovanni left the lordship to three nephews Galeazzo, and Bernabò. Matteo was killed (1355) by bre , who divided the Milanese, Bernabò residing in Milan 5) and Galeazzo in Pavia (1354–78). Galeazzo left a son, leazzo, who became sole lord of Milan by seizing and im- g his uncle Bernabò. For an account of this most powerful ITALY. It was under him that the cathedral of Milan Certosa of Pavia were begun. He was the first duke of having obtained that title from the emperor Wenceslaus. Giovanni Maria, who reigned at Milan (1402–1412), and Maria, who reigned at Pavia (1402–1447), succeeded him. , on his brother's death, Filippo united the whole duchy sole rule, and attempted to carry out his father's policy ndizement, but without success.

o was the last male of the Visconti house. At his death a was proclaimed, which lasted only three years. In 1450 eral Francesco Sforza, who had married Filippo's only child Visconti, became duke of Milan by right of conquest it by ht. Under this duke the canal of the Martesana, which s Milan with the Adda, and the Great Hospital were carried rancesco was followed by five of the Sforza family. His son o Maria (1466–76) left a son, Gian Galeazzo, a minor, whose and uncle Lodovico usurped the duchy (1479–1500). Lodo s captured in 1500 by Louis XII. of France, and Milan d for twelve years under the French crown. In the partial nt which followed the battle of Ravenna, Massimiliano protégé of the emperor, was restored to the throne of Milan, d it by the help of the Swiss till 1515, when Francis I. e reconquered the Milanese by the battle of Marignano, ssimiliano resigned the sovereignty for a revenue from France rangement did not continue. Charles V. succeeded the Maximilian, and at once disputed the possession of the with Francis. In 1522 the imperialists entered Milan and ed Francesco Sforza (son of Lodovico). France re-entered nd with him ended the house of Sforza. From this date till of the Spanish succession (1714) Milan was a dependency of anish crown. At the close of that war it was handed over ria; and under Austria it remained till the Napoleonic gn of 1796. For the results of that campaign, and for the of Italian progress towards independence, in which Milan a prominent part by opening the revolution of 1848, the s referred to the article ITALY. The Lombard campaign of ith the battles of Solferino and Magenta, finally made Milan f the kingdom of Italy.

LAZZO, a city of Italy in the province of Messina dy, 20½ miles west of Messina, is built on the eastern of the Bay of Milazzo, partly on the isthmus of the ntory, Capo Milazzo, which divides it from the Bay vieri. It consists of an old or upper town protected ong bastioned walls, and a lower or modern town outside of the enceinte. The fine old castle is now as a prison. Besides a certain amount of foreign merce (37 vessels with a burden of 6707 tons entered 1881, 93 with 13,496 in 1863), Milazzo carries on coasting trade (194,366 tons in 1881, 40,138 in and is one of the seats of the tunny fishery. The nnual population increased from 10,193 in 1861 to in 1881, and that of the city was 7127 in 1871.

Milazzo is the ancient Mylæ, a seaport and fortress founded the Zanclean (Messanian), which gave its name to the the Mylæan plain in which the Mamertines were defeated by n 270 B.C. In 1123 it was the scene of an unsuccessful con to transfer Sicily to the French. Captured by the Germans it was besieged by the Spaniards, but relieved by a Neapoli English force. In July 1860 the defeat of the Neapolitan vicinity and the capture of the fortress forced direct the ne act of Garibaldi's victorious campaign. The Bay of Mila been the scene of the defeat of the Carthaginian navy by (260 B.C.), of Pompeius by Octavian's general Agrippa (36 B. of the French and Mussulman galleys by the Pisans (1718).

MILDEW (explained as "meal-dew" or, with probability, as "honey-dew") is a popular name to various minute fungi from their appearance, and the sudden, dew-like manner of their occurrence. many other popular names of plants, it is used to different species which possess very small bo affinity. The term is applied, not only to spec longing to various systematic groups, but also t as follow different modes of life. The corn r the hop-mildew, and the vine-mildew are, for ex parasitic upon living plants, and the mildews of dam and of paper are saprophytes, that is, they subs matter which is already dead. It is generally pos draw a distinct line between parasitic and sapr fungi; a species which attacks the living body of does not grow on dead matter, and *vice versâ*. This so far as is known of perhaps all the higher fungi *Saprolegnia ferax* (Gruith.), a parasite of fres fishes (especially of the salmon), which also grows on their dead bodies and on those of flies, &c. As mildews in general, the conditions of life and grow mainly suitable nutrition and dampness accompanie high temperature. The life-history of the same spe mildew frequently covers two or more generation these are often passed on host of different kind some cases again the same generation continues its to the same kind of host, while in other the same tion grows on various hosts. For information reg fungi generally see FUNGUS, vol. ix. p. 827.

The following examples are of common occurrence

The Corn-Mildew (*Puccinia graminis*, Pers., *Uredinea*).—This disease of our grain crops and of other grass plants is very widely distributed, like it over the earth, and is by far the most important to all mildews. Its life-history is passed in three gene

two of them on the grass plant and one on the ba In early spring the first generation is found on th leaves and leaf-sheaths of grass plants (on wh disease has hibernated), presenting to the naked appearance of thin black streaks. When examined microscope these streaks are seen to consist of a number of minute two-celled and thick-walled telent (reproductive bodies), each situated at the end of (see A in fig. 2, vol. ix. p. 831). These have burst t the epidermis of the plant from their origin on among the tissues beneath. When they have b contact with excessive moisture for a few hours, the spore-cells germinates by emitting a fine tube promycelium, on which there are borne small rou walled sporidia (reproductive bodies). The spori easily detached and carried from place to place wind, and on alighting on the leaves of a barberry

erminate by pushing out a small tube which per-
the epidermis and thus gains access to the interior
caf, where it branches copiously, and forms a mass
ul like tissue called mycelium. The germ tubes of
are unable to enter the grass plants.
six to ten day. thus n ne to flask
bodies called pycnidia (vol. ix. p. 831, fig. 2
immediately under the surface of the leaf (usually
er one), but breaking through it at the neck of the
out of which there protrudes a bunch of hair
the flasks are formed at the end of stalks many
ngly small oval bodies called spermatia, which escape
the neck. The spermatia of these bodies have not yet
inately made out, but they bear a very strik
emblance to the male sexual organs of other fungi
an be no doubt. In the same leaves and on the same
m there arise several days later numerous ba
bodies containing erect stalks, bearing at the apex
ber of round zoöthecospores (reproductive bodies) in
ecidia (vol. ix. p. 831, fig. 2 B, a). These con
the second generation. On their escape they
ate by emitting a tube which, if the host on which
ll be a grass plant, enters the leaf through one of
mata in the epidermis, and there by branching forms
mycelium. On this there soon appears, but ting
the epidermis, a new generation consisting of round
uredo pores produced at the end of stalks (vol. ix.
fig. 2 C). The uredospores constantly reproduce
neration, and in such abundance that the grain crops
massively ravaged by it attack. It is in this sense
at the term mildew is popularly given to the fungus.
In autumn on the same mycelium the two-celled
spores appear, and these after hibernating renew in
the life history. This very remarkable cycle of
ions was first traced by Professor de Bary.

Hop Mildew (Sphærotheca Castagnei Lev., Order *Pyre*
a parasite the spores of the hop thrown off often to in
many other plant, such as *Potentilla, Lysimachia, Lychnis*,
cucumbis, cranesbill. The disease fir
n appears on the young and leaves of the hop as
pot and limit mate. Pyc
n bear many minute, round conceptacles (perithecia) which
ir supporting threads or hyphæ coloured. Within each
numerous found a somewhat oval body termed an ascus, con
ght ascospores (reproductive bodies).

Vine Mildew (Uncinula Prolacis Berk., Order *Perisporiacei*)
only in one generation called the oidium stage soon dis
ring of the vine the attack takes place on the young leaves,
ich the thin white mycelium spreads rapidly to the other
d twigs which it does not appear to affect. Its presence is
f damage is done to the grapes while they are in a very
condition. The mycelium which travels over the surface
own at intervals into the tissues short irregular protuber
ted haustoria, which perform for it the function of root
rise from the mycelium short stalk bearing each a single
s. The disease spreads on the same plant not
the extension of the mycelium but by the simultaneous
tion of the points. Here no perithecia are known.

Rose Mildew (Sphærotheca humuli var. hortorum, Berk., Order *Perisporiacei*)
a parasitic fungus, the oidium stage of which is saprophytic in its mode of
on dead leaves, and bears a large filamentous mycelium on
upon which the spores occur. Finally a round brown peri-
is formed upon the threads which appear as radiating
With both the oidium and numerous linear asci contain-
a row of dark-coloured spores.

ject on account of the wide commercial connexions of th
The early electrum coinage belongs to the Phœnician or Græco-
standard, which was introduced from Phœnicia and spread ove
of the Ionian and Thracian cities through the influence of M
trade. Very archaic coins of Miletus, Ephesus, Cyme, and Sa
known of this standard, and at a somewhat later date of Chios,
Clazomenæ, Lampsacus, Abydus, and Cyzicus. The lion is the
Milesian type, often with a star beside or above him.

of from 1 to 2 miles. In most places it has a f from 15 to 19 fathoms, and, as it is completely d by hills, vessels can ride in it at anchor in all of weather. The royal dockyard, founded at in 1790, was removed in 1811, and from that time as been in a languishing condition. The town es iron-works. The shipping trade is confined to coasting vessels, but with the completion of new capable of receiving vessels of the largest tonnage, posed that a considerable trade may be carried on nerica. The population of the urban sanitary di- 1871 was 3252, and in 1881 it was 3813.

FORD, a post-village of the United State , in ter county, Massachusett , lies 31 miles south-west on, at the junction of the Milford branch of the and Albany Railroad with the Hopkinton Milford, onsocket Railroad. It is one of the principal seats boot manufacture in New England, and also pro- arge quantities of straw goods. The population 10 in 1880.

IC, or MILITSCH, of Kremsier, Moravia, was the nfluential among those preachers and writers in a and Bohemia who during the 14th century paved y for the reforming activity of Hus and through that of Luther. He was born about 1325, was in holy orders in 1350, in 1360 was attached to rt of the emperor Charles IV., whom he accompanied rmany in that year, and about the same time also canonry in the cathedral of Prague along with the of archdeacon. About 1363 he resigned all his ments that he might become a preacher pure and ; he addressed scholars in Latin, and (an innovation) ly in their native Czech, or in German, which he d for the purpose. The success of his labours in ing the fallen made itself apparent in the reforma- a whole quarter of the city of Prague. As he dwelt nd more on ecclesiastical abuses and the corruption clergy, and viewed them in the light of Scripture, viction grew in his mind that the "abomination of ion" was now seen in the temple of God, and that ist had come, and in 1367 he went to Rome (where V. was expected from Avignon) to expound these He affixed to the gate of St Peter's a placard ncing his sermon, but before he could deliver it was into prison by the Inquisition. Urban however, arrival ordered his release, whereupon he returned to , and from 1369 to 1372 preached daily in the Teyn there. In the latter year the clergy of the diocese ined of him to the papal court at Avignon, whither summoned in Lent 1374, and where he died before e was decided. He was the author of a *Libellus de risto*, written in prison at Rome, a series of *Postillæ ectiones Quadragesimales* in Latin, and a similar of *Postils* in Czech.

LITARY FRONTIER (German, *Militärgrenze*; ic, *Granica*), a narrow strip of Austrian Hungarian ry stretching along the borders of Turkey, which centuries a peculiar military organization, and from to 1873 constituted a crown land. As a separate n of the monarchy it owed its existence to the ty of maintaining during the 15th, 16th, and 17th ies a strong line of defence against the invasions of rks, and may be said to have had its origin with ablishment of the captaincy of Zengg by Matthias us and the introduction of Uskoks (fugitives from y) into the Warasdin district by the emperor and I. By the close of the 17th century there were frontier "generalates"—Carlstadt, Warasdin, and ia (the last also called the Banal). After the defeat Turkish power by Prince Eugene it was proposed to abolish the military constitution of the frontier, bu change was successfully resisted by the inhabitants o district; on the other hand, a new Slavonian frontier trict was established in 1702, and Maria Theresa ext the organization to the march lands of Transylvania Szekler frontier in 1764, the Wallachian in 1766).[1]

As a reward for the service it rendered the Gover in the suppression of the Hungarian insurrection in the Military Frontier was erected in 1849 into a crown with a total area of 15,182 square miles, and a popu of 1,220,403. In 1851 the Transylvanian portion (about a third) was incorporated with the rest of Tr while and in 1871 effect was given to the imperial of 1850 by which the districts of the Warasdin regi (St George and the Cross) and the towns of Zengg, Ka Karlstadt, &c., were "provincialized" or incorporated the Croatian-Slavonian crown-land. In 1872 the Hungarian Diet followed suit, and in 1873 the old mi organization was abolished in all the rest of the fr Not till 1881, however, were the Croatian-Sla march lands completely merged in the kingdoms to they naturally belonged.

The social aspect of the military frontier régime is inte A communal system of land tenure natural to the old Sla was artificially kept in existence. The piece or plot of assigned to the original family of settlers remained the prop the family as such, and could not be portioned out among the members. In this way the house-community, all under t of the same house-father and house-mother (who were no sarily man and wife, nor the oldest members of the comm and all living within the same palisade, sometimes came t ber two or three hundred persons. The "family" dined in mon hall, and after dinner discussed and settled matters a the common weal. Every man possessing real property country, and capable of bearing arms, was liable to military from his twentieth year. The house-communities are now ning to avoid the motive of the perpetual partition law stranger are free to come and acquire property in land towers with wooden clappers and the beacons which fir alarm along the whole frontier in a few hours are still fa the landscape.

MILITARY LAW consists of the statutes, rule cedure, royal warrants, and orders and regulations prescribe and enforce the public obligations of the soldiers, and others made subject to its provisions essential purpose is the maintenance of discipline; also includes the administrative government of the f force of the state, more especially in the matter of ment, service, and billeting. The term "martial sometimes applied to it, as regard modern time a misnomer. For martial law, as it is now unde applies not only to military persons but to the civ munity, and may be described generally as the abro of ordinary law and the substitution for it of f force uncontrolled save by what, in the discretion commanding general, may be considered the nece the case.

The military law of England in early times exist the [illegible] in the [illegible] period of [illegible]

were raised for a particular service, and were dis- upon the cessation of hostilities. The crown, of its prerogative, made laws known as Articles of War, government and discipline of the troops while thus ed and service. Except for the punishment of on, which offence was made a felony by statute in gn of Henry VI, the ordinances or Articles of ncerned, lacked the due authority for the enforce- during peace until 1689 when the first Mutiny Act ed and the military force of the crown were t under the direct control of parliament. Even the nentary force of the time of Charles I and Cromwell overned not by an Act of the legislature, but by of war made by those raised by the King and ed by ordinance of the Lords and Commons, e to that of the sovereign prerogative. This d however, by prerogative was, however, held to declare during a state of actual war only, and to exercise at no time of peace were ineffectual to this limitation it existed for considerably more century after the passing of the first Mutiny Act 689 to 1803, although in peace time the Mutiny s occasionally altered to express a statutory power n to the crown to make Articles of War to operate olonies and elsewhere beyond the seas in the same as those made by prerogative operated in time of In 1715, in consequence of the rebellion this power ated in respect of the forces in the kingdom. But nactments were apart from and in no respect affected people acknowledged all this time that the crown of prerogative could make laws for the government army in foreign countries in time of war. The Act of 1803 effected a great constitutional change in respect the power of the crown to make any of War became altogether statutory and the pro- mitted in the Act of Parliament. So matters d till the year 1879, when the last Mutiny Act sed and the last Articles of War were promulgated utiny Act legislated for offences in respect of which a penal servitude could be awarded and the of War, while reserving those provisions of the re-granted the direct authority for dealing with for which unparliamentary punish- as well as with many matters relating to trial and ure. The Act and the Articles were found not to ize in all respect. Their general arrangement was and their language sometimes obscure. In 1869 a mission recommended that both should be recast ple and intelligible shape. In 1878 a committee House of Commons endorsed this view and made mmendations as to the way in which the task i performed. In 1879 the Government submitted and passed into law a measure which, while re- Act of the Mutiny Act and the Articles of War, the introduction in certain important respects of new code called the "Army Discipline and Act." After one or two years' experience which to a large extent were found capable of improvement, ments were provided by the Army Act, 1881, now form the foundation and the main portion military law of England. It contains a proviso the right of the crown to make Articles of War, such a manner as to render the power in effect ty for it enacts that no crime made punishable by shall be otherwise punishable by such Articles. punishment of every commissioned officer is provided the Act, any Article made thereunder can be no than an empty formality having no practical effect. history of English military law up to 1879 may ded into three periods, each having a distinct constitutional aspect:—(1) that prior to 1689, when the a being regarded as so many personal retainers of sovereign rather than servants of the state, was ma governed by the will of the sovereign; (2) that betw 1689 and 1803, when the army, being recognized as a manent force, was governed within the realm by sta and without it by the prerogative of the crown; and that from 1803 to 1879, when it was governed ei directly by statute or by the sovereign under an autho derived from and defined and limited by statute. Altho in 1879 the power of making Articles of War becam effect altogether inoperative, the sovereign was empow to make rules of procedure, having the force of law, w regulate the administration of the Act in many ma formerly dealt with by the Articles of War. These r however, must not be inconsistent with the provisio the Army Act itself, and must be laid before parlia immediately after they are made. Thus in 1879 government and discipline of the army became for the time completely subject either to the direct action or close supervision of parliament.

A further notable change took place at the same t The Mutiny Act had been brought into force on occasion for one year only, in compliance with the constitutional theory that the maintenance of a standing a in time of peace, unless with the consent of parliamen against law. Each session therefore the text of the had to be passed through both Houses clause by clause line by line. The Army Act, on the other hand, is a permanent code. But constitutional traditions are respected by the insertion in it of a section providing it shall come into force only by virtue of an annual A Parliament. This annual Act recites the illegality standing army in time of peace unless with the consen parliament, and the necessity nevertheless of maintaini certain number of land forces (exclusive of those ser in India) and a body of royal marine forces on shore, of keeping them in exact discipline, and it brings into the Army Act for one year.

Military law is thus chiefly to be found in the Army and the rules of procedure made thereunder, the Militia 1882, the Reserve Forces Act, 1882, and the Volun Act, 1863, together with certain Acts relating to yeomanry, and various royal warrants and regulat The Army Act itself is, however, the chief autho Although the complaint has been sometimes made, and without a certain amount of reason, that it does not ac plish much that it might in point of brevity, simpli and clearness of expression, it is a very comprehen piece of legislation, and shows some distinct improven upon the old Mutiny Acts and Articles of War.

The persons subject to military law are the office the active list and the soldiers of the regular forces (inc ing the royal marines), the permanent staff of the auxi (viz. the militia, volunteer, and yeomanry) forces, and officers of the militia. The above persons are amenab at all times except while embarked on h a commissioned ship of the royal navy, when they bec subject to the Naval Discipline Act and certain order council made under its authority. Those who are subje military law in certain circumstances only are—officers while serving in a force raised out of the Un Kingdom and commanded by an officer of the reg forces, pensioners when employed in military se under the command of a regular officer; the non-com sioned officers and men of the militia, during train when attached to the regulars or when permane embodied, the officers of the yeomanry and the volun when in command of or attached to a body of men sub to military law, or when their corps is on actual mili

, or when ordered on duty with their own consent; n of the yeomanry when they or their corps are being , when they are attached to or acting with the forces, when their corps is on actual military service, n serving in aid of the civil power; the men of the ers when they are being trained with or are attached body of troops, or when their corps is on actual y service; the men of the army reserve and the reserve when called out for training or on duty in the civil power; any person who in an official y equivalent to that of an officer accompanies a of troops on active service beyond the sea; any accompanying a force on active service holding a om the general entitling him to be treated on the of an officer. In this last category would of course luded newspaper correspondent, also sutler and rs. In one or two cases persons are subjected tary law to a limited extent and in respect only of offences. Thus a militiaman even when not out ining or not embodied is liable to a military trial nishment for fraudulent enlistment or making a swer on attestation. In the same manner an army man may be tried and punished by court martial glect to appear at the place where he is bound cally to report himself, or for insubordination to his rs on these occasions, or for any fraud in connexion he receipt of his pay. A man of the army reserve militia reserve has the legal status of and in fact s a regular soldier when called out on occasions of l danger or emergency under the sovereign's pro- ion.

n a person subject to military law commits an he is taken into military custody, which means arrest in his own quarters or confinement. He without unnecessary delay be brought before his nding officer, who upon investigating the case may the charge if in his discretion he thinks it ought be proceeded with, or may take steps to bring the r before a court martial. Where the offender is not er he may dispose of the case summarily, the limit power in this respect being seven days' imprison with hard labour, fines not exceeding 10s. for ness, certain deductions from pay, confinement to s for twenty-eight days, this involving severe extra deprivations, and other minor punishments. Where ence is absence without leave for a period exceeding days, the commanding officer may award a day's mment in respect of each day of such absence up nty-one. It is only in the case of the imprisonment ing seven days that the evidence before the com- g officer is taken on oath, and then only in the of the accused so desiring it. The commanding is enjoined by regulation not to punish summarily re serious kind of offences, but his legal jurisdiction s respect is without limit as regards any soldier t before him, and when he has dealt summarily case the accused is free from any other liability in t of the offence thus disposed of. In any instance the commanding officer has summarily awarded onment, fine, or deduction from pay, the accused laim a district court martial instead of submitting award.

inary courts martial are of three kinds, viz.: (1) a ental court martial, usually convened and confirmed e commanding officer of the regiment or detachment, ed over by an officer not under the rank of captain, sed of at least three officers of the regiment or ment with not less than one year's service, and g a maximum power of punishment of forty-two days' onment with hard labour; (2) a district court martial, usually convened by the general of the dis consisting in the United Kingdom, India, Malta, Gibraltar of not less than five and elsewhere of no than three officers, each with two years' service or and having a maximum power of punishment of two y imprisonment with hard labour; (3) a general court ma the only tribunal having authority to try a commiss officer, and with a power of punishment extending to penal servitude, for offences for which these pen are authorized by statute, it consist of not less nine officers in the United Kingdom, India, Malta, Gibraltar and of five elsewhere, each of whom must over three years' service, five being not under the ra captain. There is another kind of tribunal incident service in the field, or where, in the case of an of against the person or property of an inhabitant, an ord court martial cannot be held, namely, a field general martial. This court may consist of three officers only it has the power of sentencing to death. Another ki court, called a summary court martial, may be held w an offence has been committed upon active service an ordinary court cannot be conveniently assembled. I event of three officers not being available it may cons two. When thus constituted it can award only a "sum punishment" or imprisonment; where it consists of officers, however, it can sentence to death. In the ca a field general or a summary court martial many f and precautions prescribed in the case of ordinary c are not necessarily observed, the whole proceeding from the necessity of the case a somewhat rough and means of dealing promptly with crime.

The Army Act prescribes the maximum punishment whic be inflicted in respect of each offence. That of death is m by various acts of treachery or cowardice before the enemy, when on active service interfering with or impeding authority ing without orders a guard or post, or when sentry sleeping o drunk on a post, plundering or committing an offence again person or property of an inhabitant, intentionally causing alarms, or deserting. Whether upon active service or not, s also becomes liable to the punishment of death who mutinies cites to or joins in or connives at a mutiny, who uses or offers v to or defiantly disobeys the lawful command of his superior when in the execution of his office. Penal servitude is the max punishment for various acts and irregularities upon active s not distinctly of a treacherous or wilfully injurious character using or offering violence or insubordinate language to a supe disobeying a lawful command when upon active service. The punishment is applicable when not upon active service to a offence of desertion or fraudulent enlistment (i.e., enlistment one who already belongs to the service), certain embezzlem public property, wilfully releasing without authority a pri wilfully permitting a prisoner to escape, enlisting when pre discharged from the service with disgrace without disclosin circumstances of such discharge, or any other offence which ordinary criminal law of England is punishable with pena vitude. Imprisonment with hard labour for two years maximum punishment for various forms and degrees of those o which if committed upon active service would involve de penal servitude, such as using or offering violence or insubor language to a superior or disobeying a lawful command, and following offences: treasure in escort, breaking out of ba neglect of orders, an offence of desertion or attempted de or aiding or conniving at desertion, or of fraudulent enli absence without leave, failure to appear at parade, going b prescribed bounds, absence from school, malingering or p pretended disease or infirmity, maiming with intent to render a unfit for service, an act of a fraudulent nature, disgraceful conduct of a cruel, indecent or unnatural kind, drunkenness, reb prisoner without proper authority or allowing him to escape, concerned in the unreasonable detention of a person awaiting escaping or attempting to escape from lawful custody, commit combatant exactions, making away with, losing by neglect, or w injuring military clothing or equipment, illegally absenting h in the service, making false or fraudulent representations in documents, making a wilfully false accusation against an off soldier, making a false confession of desertion or fraudulent ment, or a false statement in respect of the prolongation of fu misconduct as a witness before a court martial or contempt court, giving false evidence on oath, any offence specified in r

sing or the impressment of carriages, making a false answer
estion put upon attestation, being concerned in unlawful
ent, using traitorous or disloyal words regarding the
gn, disclosing any circumstance relating to the numbers,
, movements, or other circumstance of any part of her
's forces so as to produce effects injurious to her majesty's
fighting or being concerned in or conniving at a duel,
ting suicide, obstructing the civil authorities in the apprehen-
any officer or soldier accused of an offence, any conduct,
, or neglect to the prejudice of good order and military dis-
any offence which if committed in England would be punish-
the law of England. There is another offence which can be
ted by officers only, namely, "scandalous conduct unbecom-
character of an officer and a gentleman." It necessitates
ce, a punishment which in the case of an officer may be
d as an alternative for imprisonment in several other instances.
ri-social offence peculiar to officers and non-commissioned
that of striking or ill-treating a soldier or unlawfully
g his pay. An offence of cheating as distinguished from
ch must also in the case of an officer involve an incapacity to
e crown a man. An officer may be also sentenced to forfeiture
rity of rank and to reprimand or severe reprimand. A
mmissioned officer may be sentenced to be reduced to a lower
to the rank, and where sentenced to penal servitude or
prisonment is deemed to be reduced to the rank. The com-
in chief at home or the commander in chief in India or in
the presidencies may also cause a non-commissioned officer
fficer to a lower grade or to the ranks. An acting non-
missioned officer may be ordered by his commanding officer for
ce or for inefficiency or otherwise to revert to his per
grade, in other words, to forfeit his acting rank.

It has been observed that persons subject to military law
e to be tried by court martial for offences which if com-
n England would be punishable by the ordinary law, and to
the punishment prescribed by the ordinary criminal
hat authorized for soldiers who commit offences to the
of good order and military discipline. The effect of the
rnative is that for many minor offences for which a civilian
to a short term of imprisonment, or perhaps only to a fine,
may be awarded two years' imprisonment with hard labour.
martial, however, cannot take cognizance of the crimes of
murder, manslaughter, treason felony, or rape if committed
nited Kingdom. If one of these offences be committed in
e within her majesty's dominions other than the United
or Gibraltar, a court martial can deal with it only if it be
d on active service or in a place more than 100 miles from
ourt having jurisdiction to try the offence. With regard to
offences the military law, it is to be understood, is subor
to the ordinary law, and a civilian aggrieved by a soldier
t of a criminal offence against his property or person
forfeit his right to prosecute the soldier as if he were a

nces for which soldiers are most frequently tried are desertion,
without leave, loss of necessaries, violence or insubordina
ngness, drunkenness, and various forms of conduct to the
d discipline. The punishments are generally speaking
s much with regard to the character and antecedents of
der as to the particular offence. For a first offence of an
kind a district court martial would rarely give as a rule fifty-six
prisonment with hard labour for a second or graver crime
ear does. There are not many instances in which the
hoped punishment exceeds six months. Corporal punishment,
has been practically limited to offences committed upon
service, and in 1879 to crimes punishable with death, was
olished in 1881, and a summary punishment substituted
ects punishment includes the liability for a term of three
to be kept in a cell and handcuffs, and while so kept
to be fed on bread and water only, so that the offender may remain in
ion for a period not exceeding two hours in the day for
three consecutive days, and for not
than two such days in the aggregate. The offender may
subjected to the loss of pay and restraint, and may be kept
the time he would otherwise be sentenced to hard-labour imprison
But the corporal punishments are to be inflicted so as
cause injury to health or leave a permanent mark on the
The last instance in which this kind of punishment
icted occurred arose out of the campaign of 1882 in Egypt
ed by the results, the abolition of flogging does not appear
injuriously affected the general conduct of the troops in
aving been exceptionally good. The practice of marking, a
with the letters "D" (deserter) or "BC" (bad character),
to prevent his re-enlistment, was abolished about a dozen
in deference to public opinion which erroneously adopted
that the "marking" was effected by red-hot irons or in
ner involving torture. Military men for the most
ret its abolition, and maintain that if the practice were still
the army would not be tainted by the presence of many bad

characters who find means of eluding the vigilance of the au
and enlisting after previous discharge.

The course of procedure in military trials is as follows.
soldier is remanded by his commanding officer for trial by a
or general court martial, a copy of the charge, together w
statements of the witnesses for the prosecution (called t
mary of evidence), is furnished to him, and he is given prope
tunity of preparing his defence, of communicating with his w
or legal adviser, and of procuring the attendance of his w
Further, if he desires it, a list of the officers appointed to
court shall be given him. Any officer is disqualified to
member who has convened the court, who is the prosecu
witness for the prosecution, who has made the preliminary
into the facts, who is the prisoner's commanding officer, or
a personal interest in the case. The prisoner may also c
any officer on the ground of bias or prejudice similarly as m
might challenge a juror. Except as regards the delay ca
the writing out of the evidence, the procedure at a court
is very much the same as that at an ordinary criminal tri
examination and cross-examination of the witnesses, address
prosecutor and prisoner, and the rules governing the admi
rejection of evidence being nearly identical. At a gener
martial, and sometimes at a district court, a judge advocat
senting the judge advocate general officiates, his functions be
much those of a legal assessor to the court. He advises upon a
of law, and sums up the evidence just as a judge charges
When the prisoner pleads guilty the court finds a verdict
ingly, reads the summary of evidence, hears any state
mitigation of punishment, and takes evidence as to charact
proceeding to pass sentence. The sentence is that of the
of the court, except where death is awarded, when two-thir
members in the case of a general court martial and the
that of a field general court martial must concur. When an
upon all the charges takes place the verdict is announced
court, and the prisoner is released without any further pro
When the finding is "guilty," evidence as to character
and the court deliberates in private upon the sentence,
result is not made known until the proceedings are confir
promulgated. No conviction or sentence has any effect u
thus confirmed by the proper authority. The confirming a
in the case of a regimental court is the commanding officer,
of a district court martial the general officer command
district, and in that of a general court, if held in the
kingdom her majesty, and if abroad in most cases the gener
commanding. The confirming authority may order the reass
of the court in order that any question or irregularity may b
and corrected, but not for the purpose of increasing a senten
may, however, of his own discretion, and without further r
to the court, refuse confirmation to the whole or any portio
finding or sentence, and he may mitigate, commute, or
remit the punishment. In the case of a general court
the proceedings are sent to the judge advocate general, who
to the queen his opinion as to the legality of the trial and s
If they are legal in all respects he sends the proceeding
commander in chief, upon whom rests the duty of advising t
regarding the exercise of clemency. In addition to confi
however, every general or district court martial held out
has another ordeal to go through. It is reviewed and exa
the office of the judge advocate general, and any illegality t
be declared is corrected and the prisoner is relieved of
sequence. To a certain extent a protection against illega
exists in the case of regimental courts martial. A monthl
of those held in each regiment is laid before the general co
ing the district or brigade, by whom any question that migh
not free from doubt or difficulty would be referred to the adjutant genera
judge advocate general for decision. It is to be noted, howe
the judge advocate general, although fulfilling duties whic
their nature judicial, is only an adviser. He is not actually
in the executive sense, and has no authority directly to interf
or correct an illegal conviction. In many cases the law t
vides no remedy for an officer or soldier who may have been
by the finding or sentence of a court martial,—for i
through a verdict not justified by the evidence or throug
observance of the rules and practice prescribed for these t
A person who has suffered injustice may appeal to the Queen
division of the high court of justice. But, speaking genera
full appeal would not interfere with a court martial exerc
jurisdiction within the law as regards the prisoner, the cr
the sentence. In most cases, therefore, the virtual protect
accused person against illegality is the judge advocate
who personally advises the queen and the military authori
the law shall be complied with. As a privy councillor and
of the House of Commons that officer is responsible bot
queen and to parliament for the right and due administ
military law; and, notwithstanding his want of direct e
authority, it is not to be contemplated that any militar
would hesitate to act upon advice given by him with refer

estion connected with a court martial. The department of
ge advocate general consists of the judge advocate general,
a lawyer, a privy councillor, and a member of parliament,
manent deputy judge advocate general who is also a lawyer,
three military officers as deputy judge advocates having
xperience in the working of military law.
rmy Act applies to European officers and soldiers serving in
the same manner as to the rest of the army, but natives
are governed by their own Articles of War, and in the case
offences they are dealt with according to the provisions of
ian penal code. The department of the judge advocate
n India is distinct from and independent of that of the
vocate general of the army, and courts martial held in that
are not subject to the supervision of a professional lawyer
prominent irregularities led to the appointment of a
as judge advocate general in India in 1869, but after a few
at appointment again became filled by a military officer.
of the department is, however, far more numerous in India
ewhere. There are judge advocates general for each of
idencies, and a deputy judge advocate at each of the more
nt military centres.

ics of Crime in the Army.—Commissioned officers are
bjected to trial by court martial. Where an officer com-
self in a military sense, and his misconduct is too serious
ssed over merely with a mark of official displeasure, he is
given and seldom fails to accept the alternative of resigning
mission. In some instances the crown is advised to exercise
gative and remove him from the army on the ground that
sty has no further occasion for his services. In no circum-
an an officer or soldier claim a court martial as a right.
sult, the annual number of trials of officers does not average
n four of late years. Among the non-commissioned officers
iers of the army, however, the trials and summary punish-
y commanding officers are exceedingly numerous, as will
y be seen. In India this observation hardly holds good, for
ountry desertion is physically almost impossible except at
or three seaports where troops are stationed. Absence
leave is for a similar reason of rare occurrence, while the
he troops living in their own cantonments, and being free
ny temptations of life existing in the large towns and garri-
home, places them outside the influence of certain prevalent
f crime. For this reason mainly the proportion of courts
held in 1881 was 107 per 1000 men at home as compared
abroad. Similarly the proportion of minor punishments
was 1449 at home to 1042 abroad. It is also generally
at men engaged upon active service in the field commit
e than those serving in ordinary circumstances. But the
riminal statistics of the army for 1881 show a formidable
of crime and punishment. Upon an average strength of
non-commissioned officers and men there were 16,523 courts
of which 179 were general, 8549 district, and 7795 regi-
ourts. There were also 224,681 minor punishments by com-
officers, including 44,108 fines for drunkenness. These
enerally show an increase of crime as compared with the
s immediately preceding, but these two exhibited a decrease
revious years. Of the offences tried by court martial in
following were the principal: mutiny 7, desertion 1597,
in relation to enlistment (fraudulently enlisting while
belonging to the service or making false answers upon
on) 1190, violence to and disobedience of superiors 1650,
subordination and neglect of orders 1472, quitting or sleep-
ost 681, drunkenness on duty 2661, drunkenness (tried by
artial when the offence has been committed on a fifth
within twelve months) 2147, disgraceful conduct of various
0, absence without leave not amounting to desertion 3293,
away with or losing by neglect equipment or necessaries,
d miscellaneous offences chiefly of an ordinary criminal
r or to the prejudice of discipline 4181. Upon the 16,523
ere were 349 findings of acquittal. Regarding the punish-
warded, it appears that no soldier was sentenced to death
the year, and the other awards were as follows:—penal
e 101, imprisonment with or without hard labour (almost
ly the former) 12,125, discharge with ignominy without
nishment 42, stoppages of pay without other punishment
ging (before the abolition of that punishment by the Act of
5, and the new summary punishment (authorized as a sub-
for flogging) 3. Of the non-commissioned officers 3228
nished by reduction to a lower grade or to the ranks, while
re suffered imprisonment in addition to loss of grade, the
number being in the proportion of about 12 and the latter
cent. to strength. Of the men tried 305 were pardoned.

ary Law of other Countries.—The administration of military
other countries having large armies harmonizes in many
nt respects with that of England. In some indeed it is a
whether their systems are not superior and in advance.
ave a considerable body of "auditors" or military lawyers
pound the law and do much to secure a uniform and exact
administration of justice. Thus in Austria there are abou
hundred of these auditors, one being attached to each regimen
the same country there are also courts of appeal from the cou
first instance, these latter consisting of eight persons includi
auditor. Where the prisoner is a non-commissioned officer
private, that rank is represented on the court. Here als
confirmation of superior authority is required. In the G
army there are general and regimental courts. An auditor
is a lawyer is attached to each division, and it is his du
expound the law, collect the evidence, and read it to the
in the presence of the prisoner, who is asked if he has any th
say. The court consists of eleven members, of whom upon th
of a private soldier or non-commissioned officer three are
rank of the accused. The power of commanding officers in
to disciplinary punishments is greater than in the British
especially in relation to officers, who may be placed in arr
fourteen days. The non-commissioned officers and privates are
to extra guards, drills, fatigues, and different degrees of arrest
of a very severe character. Dismissal from the army, which
garded as a most severe punishment, involving civil disqu
often awarded. In Russia there are three kinds of military co
namely, the regimental court martial, the tribunals of m
districts, and the supreme tribunal at St Petersburg. The
permanent courts are attended by legal persons, and in c
instances have jurisdiction over the civil population as well
army. There is a judge advocate general at St Petersburg,
the supreme tribunal consists of general officers and high wa
functionaries who have studied military law or possess a
experience of it working. In Italy there are permanent m
tribunals for the trial of non-commissioned officers, and so
while special tribunals are appointed to try officers. The co
the absolute judges of the facts, but regarding legal ir
irregularities an appeal lies to the supreme war tribunal, whic
sists of four civilian judges and three general officers. The I
code corresponds in many respects with those of the other
Continental armies, but it tends rather to give individual c
large powers of imprisonment graduated according to them
The chief distinctive feature of the French system is the insti
of regiments of discipline for refractory characters. Whe
general officer's power of imprisonment (two months) is exh
the offender may be sent before a court of discipline and by
drafted into a *compagnie de discipline*; and cases of habitual m
duct are thus dealt with, the man being struck off the stren
his original corps and transferred to one in Algeria. The m
law of the United States is founded upon and proceeds much
the same lines as that of England. (J. C. C.)

MILITARY TACTICS. See WAR.

MILITIA. The militia of the United Kin
consists of a number of officers and men maintaine
the purpose of augmenting the military strength o
country in case of imminent national danger or
emergency. In such a contingency the whole or any
of the militia is liable, by proclamation of the sove
to be embodied, that is to say, placed on active mi
service within the confines of the United Kingdom
occasion for issuing the proclamation must be first
municated by message to parliament if it be then in se
if it be not sitting, parliament must be called tog
within ten days. For the purpose of keeping the fo
a condition of military efficiency, the officers and me
subjected to one preliminary training for a period
exceeding six (usually about two) months, and furth
an annual training not exceeding fifty six (usually tw
eight) days. The force is composed of corps of art
engineers, and infantry. Infantry militiamen are fo
into battalions constituting part of the territorial re
of the locality of which the regular forces are the
battalions. The officers and men when called out are
to duty with the regulars and in all respects as r
soldiers within the United Kingdom. Of late year
men have been raised exclusively by voluntary enlist
but where a sufficient number for any county or place
thus raised a ballot may be resorted to in order to com
the quota fixed by the queen in council for that coun
place. Each man is enlisted as a militiaman for the c
to serve in the territorial regiment or corps of the di
The period of engagement is not to exceed six year
during the last of these years a militiaman may
engaged for a further period also not exceeding six

ho illegally absent themselves are liable, in addition ishment for the offence, to make up for the time of bsence by a corresponding extension of their service. ficers are appointed and promoted by the crown, but ppointments are given to persons recommended by d lieutenant of the county who may be approved lling the prescribed conditions in respect of age, ditions and educational examinations. Since 1877 ers have been permanently subject to military law. neral body of the non-commissioned officers and men subject only when called out for training or embodi At other periods they have simply the legal status ilian, except as to their liability to trial and ment for offences in connexion with enlistment or litary offences committed while called out. Each tachment has a permanent staff, consisting of an t and a small body of non-commissioned officers and ers, to conduct the recruiting drills and ordinary of the corps, and the members of the permanent re always subject to military law. They mostly of non-commissioned officers who belong to or erved in the regular portion of the territorial rt. Many of the militia corps have their head s at the brigade depot or local establishment of the ial regiment, and all are under the general supervision (regular) colonel commanding the brigade depot. ea of service does not extend beyond the United om, but those who voluntarily offer to serve in the el Islands, the Isle of Man, Malta, or Gibraltar may loyed there. The uniform of the officers and men militia is precisely the same as that of the regular rth which they are associated, or rather of which m part, except that in addition to the regimental nishing mark they bear the letter "M" upon their nents, to denote that they belong to the militia of the corp

bove stated, the ranks of the militia are usually y voluntary enlistment; but by a statute which, temporarily suspended, can be put in force provi e made to filling up any deficiency in the allotted n any county, city, or riding by ballot of the male nts at within certain limits of age. The enactment s as follows:

cretary of state is to declare the number of militiamen to- whereupon the lord lieutenant is to cause meetings to be he lieutenancy for each subdivision. To these meetings the fficers of each parish are to send returns of all male persons the age of eighteen and thirty dwelling in their respective Before the ballot, however, the parish may supply volun ent up the quota, every volunteer so provided and approved y as if he were a balloted person. If a deficiency still e persons on the lists shall be balloted for, and deficiencies of those required to supply the deficiency shall be drawn ns present when drawn may claim exemption or and the deputy lieutenants settle the question of his liability Provided that those who are of the requisite (the age of 18½ to 21) be enrolled in the order in which ey are drawn until the quota is completed. If the list ntlemen to be balloted require another ballot in the same manner f their age, who become liable to serve may, provided they be within the requisite physical qualifi and be duly approved, offer to serve.

nder the general liability of the militia is contained s having an additional and important obligation in atter of service. It is called the "militia reserve," formed of men who voluntarily undertake a liability the regular force and serve in any place to which ay be ordered in case of the proclamation of a state ment national danger or great emergency. In this they are in fact upon the same footing as the army and on the occasion of the mobilization of 1878 an 20,000 of these men became part of the regular The present strength of the militia reserve is a little under 29,000 men, and judging by past exper may be computed that about 25,000 could be added to the ranks of an army in the field in the e national danger or emergency. It is to be observe ever, that every man thus added to the regulars w taken away from the effective strength of the militi

There is no statutory provision for the number to be maintained, that number being what from t time may be voted by parliament. The latest infor available respecting the actual condition of the mi Great Britain relates to the year 1881, and that of to 1880, the militia of the latter country for political reasons not having been called out for trai 1881 or 1882. Taking the militia of the United K in 1881, we find that the establishment provided 139,501, of whom 18,618 were artillery, 1317 en and 119,566 infantry. Divided into ranks, this es ment was made up of 3534 sergeants and 1260 drum the permanent staff and of the general body 3909 2520 sergeants, 5040 corporals, and 123,238 p The number actually enrolled was 127,868 of all leaving 11,633 wanting to complete. Of the enrolled 84,864 belonged to English, 14,138 to Scot 28,866 to Irish regiments, the numbers wanting to c being for England 7420, for Scotland 162, and for 1051. As the Irish regiments were not called o information regarding the actual effective condition force as shown at the annual training does not Ireland. With regard to the English regiments, were present out of an enrolled strength of 84,86 the absentees 3144 were with and 6775 without In the Scotch regiments, 12,101 appeared at the t and of the absentees 616 were with leave and 112 out. Of the total establishment (106,584) for Britain, 99,002 were enrolled, and of those enrolled presented themselves and 3760 were absent with le 7896 actual defaulters. Of the English regimen sixths and of the Scotch regiments two-thirds were the county to which their regiments respectively be Of 92,677 men (for Great Britain) whose occu are disclosed, 17,665 were artisans, 22,221 me labourers, 26,927 agricultural labourers, and 26,56 trades. Speaking approximately, more than one the men were between twenty and thirty years about 1 per cent. between seventeen and eighteen 9 per cent. between eighteen and nineteen, and a per cent. between nineteen and twenty, while some cent were over thirty years of age. More than the chest measurements inspected in 1881 were between 5 feet 5 inc 5 feet 7 inches in height, about 20 per cent. were feet 5 inches, while only 589 out of a total of 92,67 6 feet and upwards. At the date of inspection the 296 men in military confinement and 465 in the of the civil power. On the last occasion (1880) on the Irish militia were called out, upon an establi of 32,813 and an enrolled strength of 30,515 the present at the training was 26,399, leaving 706 abse and 2264 without leave. Regiments numbering aggregate 1146 men were not trained.

As distinguished from the regular forces or standing a militia has been described as the constitutional military for country, and its history justifies the description, at least recent period when it lost its distinctive character and bec great extent merged in the regular army. It is the old Britain possesses, and in fact represents the train bands English history. Its origin is to be found in the obligati freemen between certain ages to arm themselves for the pres of the peace within their respective counties, and generally protection of the kingdom from invasion. This obligation, in the first instance upon the individuals themselves, becam to the owners of land, who were compelled to keep up their tion of horses and armour for the national defence. The for

ıdor the lieutenant of the county, empowered in this respect mission from the crown. This prerogative of the sovereign, ad been in some instances a matter of controversy, was by statute shortly after the Restoration By the same he militia of each county was placed under the lieutenant, vested with the appointment of officers, but with a reserva he crown in the way of commissioning and dismissal. The the annual training for fourteen days fell upon the local y. Offences against discipline were dealt with by the civil ates, but with a power to the officers of fining and of ning in default. Upon this footing the militia of England d for nearly a century, with the general approval of the nity. It was recognized as an instrument for defence and preservation of internal order, while it was especially from the circumstance that from its constitution and ation the crown could not use it as a means of violating the tion or abridging the liberty of the subject It was con and regulated in the county; it was officered by the land and then relatives, its ranks were filled by men not depend- their subsistence or advancement upon the favour of the its numbers and maintenance were beyond the royal control, rnment was by statute While the supreme command was ly vested in the crown, every practical security was thu gainst its use by the crown for any object not constitutional nate. It was regarded as, and was, in fact, the army of the distinguished from the standing army, which was very much y of the king personally. The latter consisted of hired , and was more than once recruited by a conscription con owever, to persons of the vagrant class not having a lawful ment, while the former was mainly composed of those having abode and status The militia thus enjoyed for many years pared with the regular forces a moral as well as a concr l superiority. About the middle of the 18th century the was reconstituted, with certain modifications, not involving e of the principle of its local government, but strengthening at the supervising influence of the crown. Thus the king appointed the permanent staff, and was given a veto upon ointment and promotion of the officers, who were to have a y qualification. A quota was fixed for each county, to be y ballot of those between the ages of eighteen and forty-five rish having the option of supplying volunteers at its own d each man balloted being permitted in lieu of serving to to provide a substitute When called out for service the s to be the same as that of the regulars, and while embodied rbled for annual training the officers and men were placed he Mutiny Act and Articles of War, with, however, a proviso time of training no punishment was to extend to death or The crown was given the power to call out the militia in apprehended invasion or of rebellion, and associated with ular army, but only upon the condition of previously in parliament if then sitting, and if it were not sitting of parliament together for the purpose A further and im- security was established to prevent an unconstitutional use militia by the crown, the estimate for its training was framed ear, not by an executive minister of the sovereign, but by use of Commons itself. Upon the initiative of a committee House, an Act was passed providing for the pay and clothing militia for the year. Upon this footing substantially the of England remained for many years, the Irish and Scotch being meantime brought under the same conditions by enactments. The force was embodied on several occasions the last and in the early years of the present century, and ributed largely to the army engaged in the Peninsula From 1813 just 100,000 men, or two fifths of those raised for the came from the militia. In this way, however, it lost its tive character as a defensive force During the peace which d the final fall of Napoleon the militia was suffered to fall ay; and up to 1852 it had only a nominal existence in the of an effete permanent staff with no duties to perform In he militia was revived just in time to enable it to fulfil most e functions. In the war with Russia it was embodied and rrison duty not only in the United Kingdom but in the rranean garrisons, thus enabling the authorities to send most available regular troops to the scene of hostilities It further outed many officers and some 30,000 men to the line It yes annually about 8000 recruits to the regulars. During dian mutiny it filled scarcely less useful functions when called out. It has since then been regularly assembled for training; and when it is brigaded with the regular forces at hot and other camps of instruction its military aptitude and ney have generally elicited the surprised admiration of pro- al soldiers. In 1871 an important constitutional change was It was part of the new army system inaugurated in that at the control of the militia should be removed from the lord ant of the county and vested wholly in the crown. It has rtually ceased to exist as a distinct body, and is a part of gular forces with a limitation as to the time and area and other conditions of service. There is no longer a regim militia. The body that would formerly be thus described is collection of militiamen of a regiment largely composed of re The votes for the maintenance of the militia are now part army estimates The officers of the militia and the line are for duty with either force, and may sit upon courts martia ccasionately This practical amalgamation of the old constit force with the standing army may appear theoretically open objection that it is thereby placed under the direct control sovereign But the day has passed when such an objection have any value. The fact of the whole army being place ct, under the direct control of a minister responsible t to the crown but to parliament is enough to dissipate any e the [illegible] the head [illegible] onal militia that forms an effective force i Canada, which is organized as an efficient local army Government of the Dominion include a minister of milit defence The force is placed under the command of a officer, assisted by an adjutant general, belonging to the army and appointed by the go The training of the of matter of peculiar care, there being a military college at Ki several of the governing body and professors of which ar of the Royal Artillery and Royal Engineers, as well as sch gunnery and military For military purposes the Dom mapped out in twelve districts The militia is divided i active and the [illegible] ves, and the total inhabitants between t [illegible] eighteen and sixty, with the usual exceptions are li military service, the extent [illegible] vary with the age man, the largest amount of [illegible] ng upon the youth of active militia comprises 12 [illegible] of cavalry, 17 field garrison batteries of artille [illegible] a mountain battery, panies of engineers, 9 mounted [illegible] orps, 94 battalions of to 10 companies each and 16 independent companies of ri The uniforms is for the most part like that of the regular and the organization and general efficiency of the whole ha been very favourably reported upon Although the obliga the Canadian militia are purely local, a large number of occasion offered themselves for general service, and in th of a war on a large scale, it is believed that the force wou tribute a valuable addition to the fighting strength of the army [illegible] of C

MILK is the fluid secreted by the mammary gla the division of vertebrate animals called *Mammalia*. glands are in a rudimentary form in the Monotreme *Ornithorhynchus* there is no nipple, but the mou tongue are closely applied over the area on which th open, and the fluid is withdrawn by suction on the the young and compression of the gland by the In *Echidna* the ducts of the gland open into a small foreshadowing the larger pouches of marsupial Marsupials the glands are more compact, and have a number of lobules They are found behind the ma depressions or those of the pouch they are not few two on each side not more than thirteen six on ea and one midway. The duct, long and tender during tion, open on a nipple which is covered by a refle the skin at the back of the pouch, thus forming a h hood or sheath. The nipple is protruded beyond th during lactation, and is much elongated. The num these nipples bears a relation to the number of you birth; thus the kangaroo, with one at a birth, ha nipples (two, generally the anterior pair, being i whilst the Virginian opossum, which produces six at a birth, has thirteen nipples. Rodents show a sponding provision for the nourishment of the young number of nipples. A seeming exception is the g guinea pig, which frequently has eight, ten, or twelve at intervals of two or three months, and yet the has only two teats to serve them, turn and turn the original stock of the domestic species breeds, ha only once annually, and has but one to two young, domestic variety is a curious anomaly due to the a circumstances of its life In the porcupine there nipples, one midway between the fore and hind leg, a other midway between this and the base of the t In the coypu, a creature often carrying its young back, whilst it swims across rivers, the teats project the flanks near the shoulders, and are of considerable

the young readily reach them. The *Insectivora* s a rule, more nipples than are found in any other Thus in the tenrec (*Centetes*) there are as many as two, and they are rarely fewer than fourteen, out in pairs from the pectoral to the inguinal . There are ten teat in the common hedgehog, six in moles and shrews, two in both and armadillos. there are two long, narrow, flat glands lying the dermal and abdominal muscles, with the sub one blubber separates them from the skin. The ity of the arrangement in these animals, where is performed under water, is the large size of the duct, which acts as a kind of reservoir, so that the may obtain a considerable supply in a very short It would appear also that when suckling takes place of the young above the surface of the water. Ruminants, in the elephant the glands and teats are the fore legs, in the rhinoceros they are inguinal; mare and ass the glands are two in number, and are between the thighs, about 9 inches in front of the the tapir has two inguinal nipples, the peccary trial and two inguinal, the wild sow eight nipples, the domestic breeds there are at least ten, extend the pectoral to the inguinal regions. Ruminants glands aggregated into a round mass in the region, pendulous in full function, divisible into ds, each of which has a large reservoir. When in teats, one pair or two pairs being the number, in on with the reservoirs become so large as to receive al name of "udder." All the deer tribe, camels, affe, and all kinds of cows have four teats; most s and the gazelles have two teats, whilst a few s have four. As to *Carnivora*, the felines have six nipples; the wolf, jackal, fox, dog have usually the seals and the walrus have four, the otters e weasels six, the bears six; and in the kinkajou *ota*) the number is reduced to two. Amongst *mata*, the aye-aye (*Chiromys*) has only one pair of about an inch and a half in front of the vulva; emurs have in addition to these a pectoral pair, in platyrhine and catarhine *Quadrumana* there is only of glands, restricted to the pectoral region. Here are between the fore legs, and the young cling to her breast in human fashion, but there is no protu the breast as in the human being. (For further see Owen's *Anatomy of Vertebrates*, vol. iii. p. 769.) e human race the glands are two in number, form ne with the skin and fat, two rounded eminences, ach side, on the front of the thorax. They extend e third to the sixth or seventh rib, and from the the sternum to the axilla. In the centre projects conical body, the *nipple*. Around the nipple is a circle, or *areola*, which is darker during pregnancy, women who have borne children than in the state. The surface of the nipple is wrinkled, and a magnifying glass is seen to be covered wi . It is perforated by numerous openings, the mouths milk ducts. The tissue of the nipple contains ous minute blood vessels, and it has at the base ar fibres arranged in concentric circles and in er bands. It has much of the character of erectile as in the *corpora cavernosa* of the penis, becoming firm, and prominent from excitement. The base gland lies on the pectoral muscle, a thin layer of intervening. The surface is covered with fat, which the smooth rounded outline. It is amply supplied ood by the long thoracic artery, some other minute s of the axillary artery, the internal intercostal and the subjacent intercostals. The nerves come e anterior and middle intercostal cutaneous branches, and the nipple is especially sensitive. The gland is posed of numerous lobes bound together by connective adipose tissue, and each lobe is formed of smaller lob Each lobe has an excretory duct, and these ducts, fifteen to twenty in number, converge towards the ar beneath which they are dilated so as to form sinuses $\frac{1}{6}$th to $\frac{1}{4}$th of an inch in calibre. From these sinuses the ducts which open on the surface of the nipple. general structure will be understood by referring to accompanying figures, along with the description.

FIG. 1.—Half diagrammatic view of a section through a lobule of the mammary gland, after Kölliker (*Atlas of Histology*, plate xl. fig 1), magnified 60 diameters. *a*, duct dividing into two branches; *b*, *b*, *b*, connective tissue passing between the ultimate pouches of the gland; *c*, *c*, pouches or alveoli of the gland, the dots representing the cells lining the

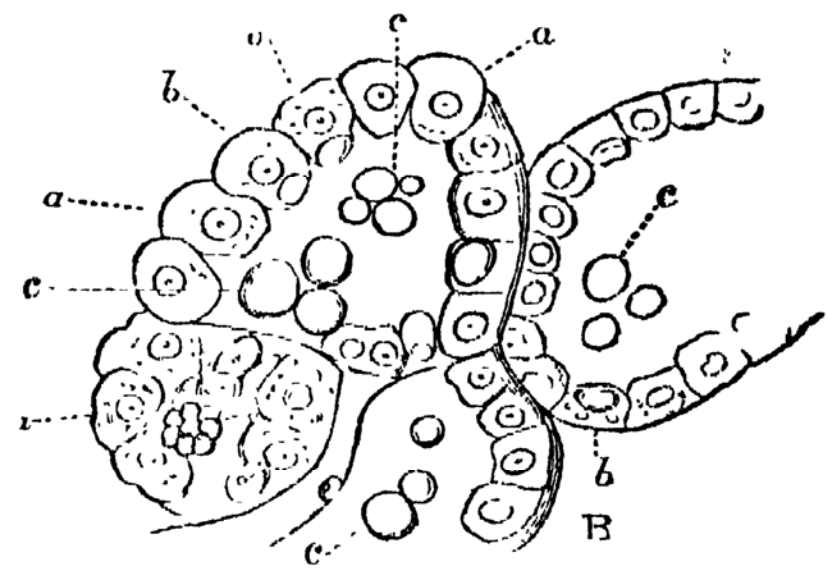

FIG. 2.—A portion of the same gland, magnified about 400 diameters, showi complete and i omplete alveoli. *a*, *a*, *a*, short, columnar, epithelial lining the alveo ch having an oval or rounded nucleus; *b*, *b*, *b*, epit cells; *c*, *c*, the interior of the alveolus, *a* milk globule; *c*, *c*, *c*, globules which have been set free from epithelial cells.

When a duct is traced into the gland, it is found to divide into smaller ducts, and these into still smaller, the smallest ductlet is reached, round the end of whic clustered several *alveoli* or pouches. Each alveolus a wall, lined with epithelium cells. In the wall of alveolus there are capillary blood-vessels which brin blood near the cells. By this blood the cells are nouri There is a minute cavity in the centre of each alveolus which cells or their products can accumulate. There be no doubt that the formation of the milk globule place in these cells. Whilst milk is not being forme cells have a granular appearance, and the lumen or ce cavity of the alveolus is small; but during secretio cavity is enlarged and shows a few milk globules, v one or more milk globules can be seen in the interi the cell. If the milk globule in the cell be very large nucleus of the cell is pressed outwards and the protop of the cell is reduced to a thin covering, over the glo at this stage presenting a striking resemblance to cell containing an oil globule. Thus each milk glob formed in the protoplasm of the epithelium cell, and at an early stage each milk globule consists of a m drop of fat or oil surrounded by a thin albuminous env It has not been clearly ascertained whether epithelial after having secreted milk globules, degenerate and off, or whether they have the power of ejecting the globules. The fluid constituents of milk (water, ho

in solution) may be separated from the blood by a
of filtration under blood pressure, as is the case in
secretory processes. The origin of the sugar of milk
f the casein is unknown. (For a description of the
e structure of the
gland, see Klein's
of Histology, p.
and references.)
he beginning of
ion the milk is
large irregularly-
decorpuscles (fig. 3,
) called *colostrum*
scles. These are
actile bodies, slow-
anging their form
squeezing out the
articles. At first
are the only bodi
nt, but they are soon replaced by the ordinary milk

les. Such globules have bright refractive edges,
urface is smooth, they vary in size from $\frac{1}{1000}$th to
,
of fatty matter surrounded by a layer of albumen
herson's membrane").
secretion of milk takes place in newly born children,
the fourth to the eighth day, and also in rare cases
n (Hermann's *Physiology*, p. 158). During
human being the mammary glands increase in
diately after the birth of the child active secretion
ences; and usually it is on the stoppage of the secre
ten months afterwards, that the process of menstrua-
which has been arrested by impregnation, again is
blished.
secretion of milk is undoubtedly affected by the
us system, as is shown by fear or mental distress
ing or injuring the quality of the secretion, and by the
" or feeling of fulness in the breast experienced by
other when the child's mouth touches the nipple, or
when she sees her offspring. The nervous mechanism,
ver, is unknown, as it has been observed that secretion
continue even after section of all the nerves known to
to the gland. The nature of the diet has a marked
nce on the quality of the secretion. Thus the
nt of casein and of fat is greater during an animal
during a vegetable diet. Fatty foods do not seem to
se the amount of fat or butter; an ample supply of
-hydrates (starches and sugars) increases the amount
gar. These facts indicate that most if not all of the
ituents of milk are formed from changes in the pro-
sm of the epithelial cells. In some women the milk
ficient in fat and casein, and consequently is less
tious. Prolonged lactation diminishes the amount of
d sugar without materially affecting the amount of
ninous matter; but the milk is less nutritious and is
for the child. The occurrence of menstruation during
ion also deteriorates the milk. (J. C. M.)

Milk as Food.

e milk of various domesticated animals is more or less
by man for food. The milk of the cow, which may
ken as typical of all others, and is indeed by far the
important and valuable of all, is, when newly drawn,
aque white fluid, with a yellowish tinge, soft, bland,
weetish to the taste, and possessed of a faintly animal
r. This odour, according to Schreiner, is due to the
nce of sulphuretted hydrogen, and disappears after a
exposure. The specific gravity of milk ordinarily
s from 1·029 to 1·033, very seldom reaching 1·035 or
g so low as 1·027. In chemical constitution it con-
sists of an emulsion of fatty globules (cream) in a
alkaline solution of casein, and a variety of sugar, p
to milk, called lactose. The fat (which when separa
know as butter) and the lactose constitute the carbon
portion of the milk regarded as food. The casein,
forms the principal constituent of cheese, and a
proportion of albumen which is present, form the
genous, while the complex saline substances and
are the mineral constituents. These various substan
present in the proportions which render milk a perfe
typical food suitable to the wants of the young
various animals for whom it is provided by nature
milk of all animals, so far as is known, contains
although they are present in somewhat different
tions. It is probable that the milk of ruminants p
certain physical and physiological distinctions from
non-ruminant animals, which will account for the
attributed to the milk of the ass and mare. The fol
table exhibits the chemical constitution of the ki
milk most frequently used by man:

	Ass					
Water	86·57	87·00	84·44	83·70	90·310	91·65
Fat	3·50	1·00	6·11	4·45	1·955	0·11
Casein and albumin	1·75	1·10	3·94	5·16	1·953	1·82
Sugar	4·00	4·08	4·68	5·73	6·285	6·08
Ash			0·79	0·96	0·369	0·34

In addition to these constituents milk contains sm
portions of the gases carbonic acid, sulphuretted hy
nitrogen, and oxygen, and minute quantities of oth
ciples, the constant presence and essential condi
which have not been determined. These consist of g
and lactochrome, substances peculiar to milk, disc
by Winter Blyth, with certain animal principles s
leucin, pepton, kreatin, tyrosin, &c. The salts i
consist, according to the average of numerous anal
Fleischmann, of the following constituents:—

Phosphoric acid	28·31	Potash	
Chlorine	16·34	Magnesia	
Lime	27·00	Ferric oxide	
Soda	10·00		

Milk thus is not to be regarded as a definite c
compound nor even as a mixture of bodies in fix
invariable proportions. Not only does the milk of d
races and breed of cow vary within comparatively
limits, the milk of the same animal is subject to ex
fluctuation. The principal causes of variation
individual are age, period of lactation, nature and
of food, state of health, and treatment, such as fre
of milking, &c. The following table indicates the
of normal variation —

Water	90·00 to 8
Fat	2·80 ,,
Casein and albumin	3·30 ,,
Sugar	3·00 ,,
Ash	0·70 ,,

The average quantity of milk yielded by cows
highly variable, both in individuals and breed
rule the smaller breeds of cows yield a small am
milk rich in cream (butter fat), while the yield
larger breed is greater in quantity, but compa
deficient in cream. A good milch cow should
a milk-giving period of from eight to nine month

[1] Ewe's milk is exceedingly variable, especially in its perc
fat. The above analysis is one of nine by Dr Voelcker,
the fat was found to range from about 2 to 12¾ per cent.

llons of milk, from which nearly 500 lb of cheese lb of butter would be obtainable.

y Treatment. Cows are commonly milked by hand three times a day. A milking machine of American which was introduced about the year 1862, has been y abandoned. The milk should be drawn from the s in as clean a condition as possible, but notwithg every precaution some amount of hair and nd and other animal debris invariably enters the ilk. It has therefore to be immediately strained h a sieve with fine wire cloth or hair strainer. As peculiarly susceptible of taint, and absorb odours lked with great avidity, it is of the utmost con e that all vessels in which it is placed or kept be so made as to be easily purified and that ould be kept scrupulously clean. In Switzerland strained with most beneficial effect through sprigs ed fir tops, which inserted loosely and uprightly e hole of a funnel arrest all hair, skin, clots, and matter on the acicular leaves. The milk drains n in a clean condition with a fresh slightly ized flavour favourable to its keeping. A fresh n used on each occasion of straining milk, so that freedom from the risk of taint which arises through of imperfectly cleaned wire gauze. The milk must oved from the cow house as quickly as possible; intended for use as new milk and for sale in the rthood of the dairy, it may at once be put up for . But if it has to travel a distance, or if it is to for creaming or cheese making, it should be rapidly lown, and kept in a cool airy milk room if practi surrounded with fresh cold water.

ordinary method of separating cream either for se or for butter making is by allowing it to form surface and skimming it off with a broad flat spoon; enous adaptations of centrifugal machines of Laval's separator is one of the best known, have troduced for the purpose of effecting the rapid and e separation of the cream. The centrifugal force machines throws the denser portions of the fluid s the side of a rapidly revolving cylinder, collecting am on an inner layer, which is carried off by one while the impoverished milk escapes by another. val separator gives a very rich cream, as will be seen e following analyses by Voelcker:

	Ordinary Cream	Cream by Separator	Skimmed Milk by Usual Separator	Ordinary Skimmed Milk
	77·30	66·12	90·82	90·55
ter	15·45	27·69	0·31	1·12
	3·40	2·69	3·31	3·09
ein	3·15	3·03	4·77	5·16
d matter	0·70	0·47	0·79	0·08

e being kept some time, depending principally on perature at which it is maintained, milk begins to sour owing to the formation of lactic acid, by a of fermentation, at the expense of the lactose or ugar. The acid so developed causes a coagulation casein, and the milk separates into a solid white nd a thin translucent yellow milk serum or whey. hanges can to a certain extent be artificially prehindered, and controlled. The following are the of analyses by Fleischmann.

Constituents of 100 Parts of Sour Milk.

100 cream	23·50	butter
	16·50	buttermilk.
100 skimmed milk	71·40	curd
	0·32	whey.
100 loss	0·30	loss.

Relative Composition of Milk and its Products.

	Water	Fat.	Casein	Albumin.	Milk Sugar
Whole milk	87·60	3·98	3·02	0·40	4·30
Cream	77·30	15·45	3·20	0·20	3·15
Skim-milk	90·34	1·00	2·87	0·45	4·63
Butter	14·89	82·02	1·97	0·28	0·28
Buttermilk	91·00	0·80	3·50	0·20	3·80
Curd	59·30	6·43	24·22	3·53	5·01
Whey	94·00	0·35	0·40	0·40	4·55

The simplest and most advantageous form in milk can be disposed of as a commercial product is sale as sweet or new milk, and it is in this mann the greater proportion of the milk produced with reach of large centres of population is disposed of. milk, cream, and skimmed milk are the only primary in which milk is sent into the market. CHEE BUTTER have been dealt with in separate articles Whey, the yellow liquid remaining after the separa the curd in cheese making, is a source of milk employed to a limited extent in pharmacy; but it equally used for feeding pigs. The buttermilk wh mains after separating butter is a most wholeson nutritious article of food.

Preservation of Milk. The numerous methods which ha proposed for the preservation of milk in a condition fit for a lengthened period resolve themselves into (1) chemical tr with alkaline salts and antiseptic bodies, (2) physical tre such as cooling or prolonged boiling, and aeration, and (3) combi with or without the addition of a preservative agent. All of preservation, however, are subject to serious disadvantag from their serving their purpose for too limited a time, interfering with the natural constitution and properties milk. Of all preservatives cold is the most efficient a objectionable. It has been shown by Soxhlet (*Dingler's Journal*, ccxxiii. 329) that milk cooled by ice-water remai and unaltered for fourteen days, but after that time ac tained taste. After twenty-eight days it coagulates on owing to the presence of acids resulting from the oxidation cream, and in thirty four days it coagulates even in the ic It is also found that milk which has undergone aerati atmospheric air has its keeping properties much improve aeration is effected by allowing the milk to fall from som in a state of fine division by passing it through the mes sieve. By another method air cooled by passing over ice through the milk.

Milk keeps sweet for a longer time when boiled, but th ties, and other properties are affected, partly owing to th of gases mixed with it when fresh. The unpleasant flavo communicated by boiling can be avoided if the action takes p closed vessel and the milk is immediately cooled dow refrigerator connected therewith. In the case of any susp taint in milk either from disease in the cow, contaminat milk by persons, or the use of infected water in cleaning boiling is also strongly to be recommended, as it eff destroys the germs of disease, in the carrying and spre which milk is a most active agent. It is with the utmost that boiled milk can be coagulated by means of rennet; treatment with acid it coagulates more rapidly and freely unboiled.

Of the various chemical compounds which have been su and more or less used for preserving milk, the most su butter has been salicylic acid, which has the advantage tasteless and inodorous. By briskly stirring in rather less grains to a pint of milk, it can be kept liquid and sweet in perature of from 60 to 65° Fahr. for twelve hours, and at 5 for a whole day. If 4 grains be used to a pint, coagulatio higher temperature is delayed from two or three days, an lower temperature the milk may be kept good from three to fi Boracic acid and borax are also employed by dairymen, th being known as giraldine salt. The presence of any chemi septic in milk is, however, at best a matter of doubtful adv

Condensation.—Milk is now treated on a large scale by a of concentration, the product of which comes into the m two forms, as "plain condensed milk" and as "preserve The credit of originating the industry is due to Mr Gail B White Plains, New York, who began his experiments abo In 1851 he introduced his plain condensed milk, which i milk from which between three-fourths and four-fifths of th has been removed, and in 1861 he rendered important ser the army in the field by supplying preserved milk which

milk similarly concentrated, with a proportion of sugar and hermetically sealed in tin cans. The manufacture was anted to Switzerland in 1865, after which condensing es were established in England, Ireland, Denmark, Bavaria, y, and elsewhere. With the introduction of the condensing here has also been associated the factory system of dealing ary products, by which the milk of many dairies is carried centre and dealt with either for condensing or for cheese or making. The following epitome of the process of condens ilk is from a paper by Mr Willard of Cornell university, ork (*Journ. Roy. Agric. Soc.*, 2d series, vol. viii., 1872) nilk when received at the factory is first passed, he says, ugh a strainer to the receiving vat; from this it is conducted ing through another strainer into the heating cans, each g about 20 gallons; these cans are set in hot water, and the held in them till it reaches a temperature of 150° to 170° it then goes through another strainer into a large vat, at ttom of which is a coil of copper pipe, through which steam duced, and here the milk is heated up to the boiling point the best quality of white granulated sugar is added, in the tion of 1½ lb of sugar to the gallon of milk, when it is drawn e vacuum pan having a capacity of condensing 3000 quarts e at a time. The milk remains in the vacuum tel n for about three hours, during which time al pr bulk in water is removed, when it is drawn n g 40 quarts each. The cans are only partially filled, and are et in a large vat containing cold water, the water being of a equal to that of the milk in the can. Here it is stirred he temperature of the condensed fluid is reduced to a little 70°, it is then turned into large drawing-cans with faucets, r to facilitate the filling of the small cans, holding ch, which are immediately soldered to exclude the air."

he case of plain condensed milk the concentration is usual l farther than is practised in preparing the preserved milk, it evaporated down to between one-fourth and one fifth of the l bulk. It is not put up in sealed tins, being intended for diate use, and keeps sweet only for a few days, varying with ate of the weather, whereas the sugared milk will keep for years. The large amount, however, of cane-sugar added served milk seriously disturbs its balance of proportions as a food, and renders it unfit to be used alone in a dilute state ubstitute for mother's milk by infants, a purpose for which it ely employed. It should also be observed that the relative rtion of fat is small, the milk being partially skimmed before erated on, so that the statement that preserved milk diluted a small proportion of water is equal to cream is not to be on. Preserved milk, rich in cream, has always a more or ened only taste, and cannot be obtained so sweet and even in r as that largely deprived of fat. According to a German of E. Klebs in Prague, plain condensed milk may be ved by adding to every 100 litres of the original milk a on of 50 grains of benzoate of magnesium in one litre of

•

lteration. Practically the invariable mode of sophisticating for sale consists in the addition of water and in the subtraction of cream, in other words, passing off skimmed or partly ed as new milk. Now and again there are found certain refinements on these simple frauds, such as adding a quantity gar to correct the specific gravity, flour or starch to increase y, and a touch of colouring matter to cover the bluish tinge would betray skimmed milk. In the United Kingdom no l standard of what constitutes pure milk has been promul but the so-called Somerset House standard has been ally recognized in law courts. According to this, new milk l contain as a minimum of solids not fat 8·5 per cent. and of 5 per cent., and of water a maximum of 88·9 per cent. The satisfactory manner of discovering the probable genuineness ample of milk is by chemical analysis carried sufficiently far termine the amount of fat and of other solids present. erous attempts have been made to place in the hands of dairy-dealers, and consumers of milk a trustworthy method of ting the condition and value of the article by simple itive tests for cream or fat—at once the most valuable con nt and one the presence of which in average proportion is ative of the quality of the whole. The simplest but at the time the least trustworthy and efficient method is by means e so-called "creammeter," which consists merely of a ated glass tube in which a measured amount of milk is placed he amount of cream it throws up is read off by means of the

Specific gravity determinations have by themselves no icance, seeing milk deprived of its cream can by dilution with be brought to correspond exactly with the original milk. by a combination of two methods,—first taking the specific ty, next observing the yield of cream by the "creammeter," finally taking the specific gravity of the milk deprived of , regard being had to the temperature of the milk in these vations, an approximately accurate idea of the value of a sample may be obtained. Among so-called "lactoscopic operations of which are based on the fact that milk rich is a much more opaque fluid than that from which cream taken or to which water is added, that invented by Feser of Munich is one of the simplest and most useful. sists of a glass tube open at the upper end and attenuated lower extremity. Into this narrower portion is fused cylindrical rod of opaque milk glass on which black marked. These lines are invisible when the lower portion tube is filled with a measured quantity of milk, but on add water they become visible. When the black lines become ual admixture of water perfectly distinct, the richness k in cream globules is indicated by the height to which mixture of milk and water has risen in the wide portion tube, which has engraved on it a scale showing on one amount of water added and on the other the proportion equivalent to the transparency resulting from such addition

Statistics. In the year 1878 it was calculated by Mr J. C that the total yield of milk from the 2,250,000 cows and in milk or in calf in England and Scotland amounted 1,000,000,000 gallons yearly. He assumed that about one that quantity (167,000,000 gallons) went to feed calves, a the daily consumption of the population was 1,000,000 being rather more than a quarter of a pint per head, which for 365,000,000 full leaving 165,000,000 gallons to be butter and cheese making. Two thirds of this quan 318,000,000 gallons Mr Morton assumed was used for cheese- yielding 2,800,000 cwts. of cheese (rather less than 1 lb pe of milk), and the remainder, 150,000,000 gallons of milk de butter-making would yield 350,000 lb of butter, or 1 lb for every 21 pints of milk. In these figures no account is Ireland, whence at that period there were sent to Englan yearly 3,500,000 lb of salted butter. In June 1882 the nu cows and heifers in milk and in calf in Great Britain did greatly from the number on which Mr Morton's estimate was based, being 2,267,175, whilst in Ireland the num 1,398,965, making the total for the United Kingdom 3, If we take approximately Mr Morton's data as the basis dom would yield, at 440 gallons per head, 1,620,219,48 of milk. Further assuming that one sixth of this is by calves, one-third consumed by population, one-third cheese making, and one-sixth used for butter making, we the yield of cheese 4,540,000 cwt. and as the yield 929,000 cwt. As Ireland is much more a butter produci cheese-yielding country, the quantity of cheese made is overestimated in these figures, and the amount of butter correspondingly understated. To bring out the consum dairy products for the year the following imports must be

	cwts	
Cheese	1,692,196	44
Butter (including butter-me)	2,192,178	11,

Thus we find the total supply of cheese to the United in 1882 was 6,538,195 cwt., and of butter the supply was ewts. Estimating the home produce of both articles at value as the imports, the cheese supply cost £18,320, the butter £16,150,000. Adding to the the probable c milk consumed as such (say 350,000,000 gallons at 1s p £7,500,000), we have for the year 1882 in round £42,000,000 expended on dairy produce within the United K

The total number of milch cows at present (1883) in th States is stated at 15,000,000, which, taking the 440 gallo yield annually 6,600,000,000 gallons, or nearly 30,000,000 milk. In America the factory system of treating milk has much greater dimensions than in Europe, and that perf treatment, combined with the cheapness of raising and feed enables the American companies to enter the European with large quantities of cheese and other dairy products of good quality which find a ready and remunerative sale.

Koumiss. Under this name is properly understood a drink prepared from mare's milk by the Tartar tribes of th empire and by the nomad races of the northern part It is made by mixing mare's milk with about one six quantity of water, and adding as a ferment about part of very sour milk or of old koumiss. This mixture in a wooden vessel which is covered over with a thick cl left for about twenty-four hours in a moderately warm During that time a thick coagulum rises to the surface, thoroughly incorporated by churning. After standing fo day, the whole mass is again thoroughly churned and m and in this state it forms new koumiss, having an agreeabl taste. The liquor is mostly stored and preserved by the skin bottles, in which the fermentation continues, develo alcoholic qualities, and mellowing and improving its taste. Tartar koumiss has the following composition:—alcohol 3

·19, sugar 2·10, albuminoids 1·86, fat 1·78, salts 0·509, ic acid 0·177, and water 93·46. A distilled spirit is prepared koumiss, which is drunk among the Tartars under the name ca or arsa. Koumiss has of late years come into prominent as a remedial agent in cases of pulmonary consumption, and lly as a nutritious form of food easily assimilated by delicate ons. It is probable that all its virtues reside in the original om which it is prepared, in which case the koumiss can only ended as valuable principally for the convenient form under the essential properties of the milk can be preserved for use. the name of koumiss a preparation of cow's milk is now very ally s quart of new milk a table-spoonful of sugar or honey and brewer's yeast, allowing mentation to proceed a sufficient length then bottling and es in the case of effervescing cider. Such a preparation con- thout the sour alcohol of genuine koumiss, but alcoholic va formed, made by a process of l fermentation, which continues after bottling develops e amount of carbonic acid and renders the liquor highly sparkling

LL, James (1773–1836), historian and political and al philosopher, was born 6th April 1773, in the village called Northwater Bridge (Bridge of North in the parish of Logie Pert, in the county of Forfar. father, James Mill, was a shoemaker; his mother, l Fenton, belonged to a race of respectable farmers. father was industrious, good natured, and pious, but known as specially intelligent. The mother was of a disposition, and resolved to educate James, her eldest or a superior destiny. He began his education at arish school, and went on to the Montrose Academy, he remained till the unusual age of seventeen and a when he went to the college of Edinburgh (1790). rding to the usage of the time and neighbourhood, he to have been sent about thirteen or fourteen to chal College, Aberdeen. His remaining so long at Montrose Academy, and his going to Edinburgh for niversity course, must be connected with his being up by Sir John and Lady Jane Stuart of Fettercairn, engaged him to be tutor to their only daughter. n for having inspired the affection of Sir Walter , and for being the mother of Principal James David . Sir John and Lady Jane Stuart contracted a attachment for Mill, which lasted throughout their At Edinburgh University Mill was distinguished as eek scholar. But he received his greatest impulse Dugald Stewart, for whom he always expressed unbounded admiration. In October 1798 he was licensed preacher, but seems to have preached very seldom ean, from 1790 to 1802, besides being occupied with ant studies extending into history and moral and cal philosophy, were devoted to various tutorships ding to find a career to his mind in Scotland, in 1802 ent to London in company with Sir John Stuart, member of parliament for Kincardineshire. He soon ted literary occupation, to which he applied himself untiring energy. His first important venture was to a periodical on a new plan, entitled *The Literary al*, which began to appear in January 1803, and nued under his editorship till the end of 1806. It the most comprehensive in its aims of any periodical erto in existence, being a summary view of all the ng departments of human knowledge. Thomas nson, the chemist, took charge of science; and many men of ability co-operated. Mill himself wrote ly in biography, history, political philosophy, political omy, and also in theology, on which his views at the were broad without being sceptical. The publisher e journal was Baldwin, who was also the proprietor e *St James's Chronicle*, a Conservative paper appear- three times a week. For two or three years, from onwards, Mill was editor, but at last gave it up, y on conscientious grounds, although in conducting it he never lent himself to the expression of any ill views, but often made it the vehicle of the opposite.

In 1801 he wrote a pamphlet on the *Corn T* advocating the impolicy of a bounty on the exportat grain. This was the beginning of his career as a po economist. In 1805 he published a translation of Vi work on the *Reformation*, an unsparing exposure vices of the papal system. He added notes and quot by way of confirmation of the author's views. O subject also he continued to hold strong opinions all th life, and often recurred to it in his articles in the re In 1805 he married Harriet Burrow, whose moth widow, kept an establishment for lunatics in Hoxton. then took a house in Rodney Street, Pentonville, whe eldest son, John Stuart, was born in 1806. It was the end of 1806 that he entered upon the composit the *History of India*, which he expected to finish in or four years. He was actually engaged upon it for t giving, however, a considerable portion of his time to writing for the support of his family. The strain up energies for the years was enormous.

He became acquainted with Jeremy Bentham in and was for many years Bentham's chief companio ally. In B Bentham, to have Mill nearer him, him Milton's house, which adjoined his own, and w property. After a few months' trial Mill had to gi this house on account of his wife's health, and went n Newington Green; but in 1814 Bentham leas house No. 1 Queen's Square, now 40 Queen Anne's close to his own garden, and gave it to Mill at a re rent, here he remained till 1831. The intimacy Bentham was rendered still closer. For four years 1811 to 1817, Bentham was at Ford Abbey, near C in Somersetshire, and there Mill and his family domesticated with him nine or ten months each yea which retirement it is probable that Mill was a accelerate the completion of his history.

In the twelve years between 1806 and 1818 he w great many articles for various periodicals. Among were the *Anti-Jacobin Review*, the *British Review*, a *Eclectic Review*, but there is no means of tracing h tributions. In 1808 he began to write for the *Edi Review*, and contributed steadily till 1813, most of his a being known. In the *Annual Review* for 1808 two a of his are traced a "Review of Fox's History," a article on "Bentham's Law Reforms," probably h published notice of Bentham. The first known art the *Edinburgh* was on "Money and Exchange" (C 1808). In 1809 (January and July) he wrote a length on Spanish America and General Miranda whom he was on terms of intimate friendship. In th number he also wrote on China. In 1810 (April) he a severe attack on the East India Company. H wrote on the liberty of the press and on the Chu England in connexion with the Lancasterian schools was an active member of the committee for pro education on Lancaster's plan. In 1811 a periodical the *Philanthropist* was started by William Alle published in quarterly numbers till 1817. Mill co-op with Allen both in the writing and in the manag He contributed largely to every number,—his pr topics being education, freedom of the press, and discipline (under which he expounded Bentham's " ticon"). He made powerful onslaughts on the chu connexion with the Bell and Lancaster controvers 1814 Macvey Napier engaged him to contribute supplement to the fifth edition of the *Encycl Britannica*. Many of the articles became notable list included "Government," "Jurisprudence," "L of the Press." "Prisons and Prison Discipline," "C

of Nations," "Education," "Beggar," "Benefit
es," "Banks for Savings." In "Jurisprudence" and
ns" he was largely indebted to Bentham; in most
others he was either altogether or in great part
l. The article on "Government" will occupy a
ent position in English history.
818 was published the *History of India*, which had
and speedy success. It was the means of changing
hor's future position. The year following he was
ed an official in the India House, in the important
ment of the examiner of Indian correspondence.
dually rose in rank till he was appointed, in 1830,
the office. He introduced his eldest son into the
epartment in 1823.
824 Bentham projected the *Westminster Review*, and
as a principal writer for three years. Some of his
igorous writings are included among those contribu-
The first was an elaborate criticism of the *Edinburgh*
as a whole; it was followed by an onslaught on the
dy. Other articles dealt with English history and
ecclesiastical establishments, which he severely in-
. To a periodical of short duration, *The Par-
tary History and Review*, he contributed an elaborate
l retrospect of the parliament of 1820-26. In
ppeared the *Analysis of the Human Mind*. From
1833 he was largely occupied in the defence of the
dia Company during the controversy attending the
l of its charter, he being in virtue of his office the
man of the court of directors. In 1831 Sir William
orth projected the *London Review*, and Mill con-
d to it during the last two years of his life. His
otable article was one entitled "The Church and its
," which was much too sceptical for the time, and
the *Review*. His last published book was the
ent on Mackintosh, which appeared in 1835. He

nsiderable space would be required to do justice to Mill's
r—intellectual and moral—as shown both in his writings
his intensely active and influential career. He was an ex-
scholar, in the sense of knowing the Greek and Roman
His other accomplishments included general history, the
hy of politics in the most comprehensive acceptation, logic,
and mental philosophy. The type of his intellect was logi-
the highest degree; he was, above all things, clear and pre-
enemy of every form of looseness of reasoning, and a crusher
iling fallacies. This is the most notable feature in his
throughout. His was also an original mind. Except in a
jects, which had been so well elaborated by Bentham that
content to be little more than an expounder of Bentham's
he gave a fresh turn to whatever topic he took up. At a
en social subjects were subjected almost exclusively to an
al handling, he insisted on bringing first principles to bear
point; in this lay both his strength and his weakness.
greatest literary monument is the *History of India*. The
s for narrating the acquisition by England of its Indian
were put into shape for the first time; a vast body of political
was brought to bear on the delineation of the Hindu civiliza-
nd the conduct of the actors in the successive stages of the
t and administration of India was subjected to a severe
n. The work itself, and the author's official connexion with
or the last seventeen years of his life, effected a complete
in the whole system of governing that country.
played a great part as a politician and political philosopher
ish affairs as well. He was, more than any other man, the
of what was called philosophical radicalism. His writings
rnment and his personal influence among the Liberal party
of his time determined the change of view from the French
tion theories of the rights of man and the absolute equality
to the claiming of securities for good government through
extension of the electoral suffrage. Under this banner it
t the Reform Bill was fought and won.
work on *Political Economy* was intended as a text-book of
ject, and shows all the author's precision and lucidity. It
d up the views of Ricardo, with whom Mill was in habitual
y. It urged strongly the modern application of the prin-
population, and started the doctrine of taxing land for the
d increment of value.
his *Analysis of the Mind* and his *Fragment on Mackintosh* Mill acquired a position in the history of psychology and
Attached to the *a posteriori* school, he vindicated its clai
conspicuous ability. He took up the problems of mind ver
after the fashion of the Scotch school, as then represented b
Stewart, and Brown, but made a new start, due in part to I
and still more to his own independent thinking. He carried
principle of association into the analysis of the complex em
states, as the affections, the aesthetic emotions, and the
sentiment, all which he endeavoured to resolve into pleasura
painful sensations. But the salient merit of the *Analysi*
constant endeavour after precise definition of terms and clea
ment of doctrines. The *Fragment on Mackintosh* is a sev
posure of the flimsiness and misrepresentations of Mack
timon dissertation on ethical philosophy. It discusses, in
thorough way, the foundations of ethics from the author's p
view of utility.

Mill's influence on the young men of his time by his conve
has been especially celebrated. Among those that came un
influence were some of the greatest names in the generati
succeeded him. He had himself a very high ideal of public
which he carried out, at the risk of sacrificing all his cha
worldly advancement, and he impressed this ideal on the
surrounded him, most of all on his own son, who has since c
his father in fame, if not in genius.

See J. S. Mill's *Autobiography*, Bain's *Life of James Mil*
Bower's *Hartley and James Mill*. (A.

MILL, John (*c.* 1645-1707), editor of an histo
important critical edition of the New Testament, wa
about 1645 at Shap in Westmoreland, entered Q
College, Oxford, as a servitor in 1661, and took his m
degree in 1669. Soon afterwards he was chosen
and tutor of his college; in 1676 he became chap
the bishop of Oxford, and in 1681 he obtained the
of Blechingdon, Oxfordshire, and was made chap
Charles II. From 1685 till his death he held the a
ment of principal of St Edmund's Hall; and in 1
was nominated by Queen Anne to a prebendal s
Canterbury. He died on June 23, 1707, just a fo
after the publication of his Greek Testament.

thirty years, and is admitted to mark a great advance on
had previously been achieved. The text indeed is tha
Stephanus (1550), but the notes, besides embodying all pr
existing collections of various readings, add a vast number
from his own examination of many new MSS and Oriental
(the latter unfortunately he used only in the Latin trans
He was the first to notice, though only incidentally, the
the concurrence of the Latin evidence with the Codex Alexan
the only representative of an ancient non-Western Greek te
sufficiently known, the hint was not lost on Bentley (see W
and Hort, *Introduction to New Testament*). Mill's various r
numbering about thirty thousand, were attacked by Whitb
Examen as destroying the validity of the text. Antony Col
argued in the same sense, though with a different object. T
called forth a reply from Bentley (*Philelutherus Lipsiensis*)
Kuster reprinted Mill's Testament at Amsterdam with the
of twelve additional MSS.

MILL, John Stuart (1806-1873), son of James
(*q.v.*), was born in London on the 20th May 1806
education was from first to last undertaken by his
and is likely long to remain a standing subject for
and discussion. Much of the wonder is no doubt
his father's monstrous inversion of custom, the bo
set almost as soon as he could speak to work at o
honoured subjects of secondary and higher educatio
was taught the Greek alphabet at the age of three,
of his earliest recollections, as he has recorded in h
biography, was learning lists of common Greek wor
their English meanings, written for him by his fa
cards. By his eighth year he had gone through
original a great many Greek books. "Of gramm
says, "until some years later, I learnt no more t
inflexions of the nouns and verbs, but after a c
vocables proceeded at once to translation; and I

ber going through *Æsop's Fables*, the first Greek which I read. The *Anabasis*, which I remember was the second. I learnt no Latin until my eighth At that time I had read under my father's tuition ber of Greek prose authors, among whom I remember ole of Herodotus and of Xenophon *Cyropædia* and *ials of Socrates*, some of the lives of the philosophers genes Laertius, part of Lucian, and Isocrates *Ad Nicoclem* and *Ad Nicoclea*. I also read, in 1813, the s dialogues (in the common arrangement) of Plato, he *Euthyphron* to the *Theætetus* inclusive." Besides Greek book, he had read a great deal of history h by Robertson, Hume, Gibbon, Watson's *II. and III.* Hooke's *Roman History*, Rollin's *Ancient History*, Langhorne's *Plutarch*, Burnet's *History Own Times*, thirty volumes of the *Annual Register*, *Historical View of the English Government*, ins' *Political and Historical History*, M'Crie's *Knox*, and two s of the Quaker

Mill "knew Greek," and "read Plato" before he ght years old is often repeated, sometimes as an e of amazing precocity, sometimes as an awful e of injudicious parental forcing. The attainment child should have done so much at such an age is ly as little grounded in reason as was Mill's own that any child might have done the same. It is n that many thousands of persons have known before the age of eight without a knowledge of the ables of Greek grammar. In presence of the fact all we never distinguished for great memory or e richness of historical or literary allusion, it is a clusion that the matter of his reading at the age a little service to him matter life as it he had read shelf of boys' own books. This is not to say that cational purposes his early years were wasted as in and his father's opinion they generally are. But otedly the main factor in Mill's education was not nature put into his hands, but his constant inter with the active richly stored mind and tremendous er of his father. If any should be tempted to the method, they should bear in mind that the e cardinal element of it. The tutor was of more nce than the books. The reading of Plato's s would have been only an exercise in torgh ion if the boy had not had a Socrates with him in communion. The child was a constant inmate of her's study, and trotted by his side in his walks, from jottings on slips of paper as good an account ould of what he had read. He thus learnt at an

post, he hints, more serviceable to his intellect than manners. His main reading was still history, but h through all the Latin and Greek authors common in the schools and universities, besides several that commonly read by undergraduates. He was not ta compose either in Latin or in Greek, and he was n exact scholar in the academic sense; it was for the s matter that he was required to read, and by the ten he could read Plato and Demosthenes with ease father's *History of India* was published in 1818; i ately the reader, about the age of twelve, John, un energetic direction, began a thorough study of the sci logic, at the same time reading Aristotle's logical t in the original. In the following year he was intr to political economy. And there, when the pup nearly fourteen, this remarkable education term From that time he worked less immediately und father's eye. It was an inevitable incident of s education that Mill should acquire many of his speculative opinions, and his father's way of def them. But his mind did not receive the impress pa and mechanically. "One of the grand objects of tion," according to the elder Mill, "should be to g a constant and anxious concern about evidence"; laboured with all the energy of his strong will allowing his son to become a parrot of his own o and argument. The duty of collecting and w evidence for himself was at every turn impressed up boy; he was taught to accept no opinion upon aut he was soundly rated if he could not give a reason beliefs. John Stuart Mill was deliberately educate apostle, but it was as an apostle of reasoned t human affairs, not as an apostle of any system of de tenets. It was purposely to prevent any falling o this high moral standard till it should become par being that his father kept the boy so closely with h Much pity has been expressed over the dreary ch existence that the child must have led, cut off fr boyish amusements and companionship, working da day on his father's treadmill; but a childhood and h spent in the daily enlargement of knowledge, w continual satisfaction of difficulties conquered, buo by day dreams of emulating the greatest of benefactors, need not have been an unhappy chi and Mill expressly says that his was not unhapp seems unhappy only when we compare it with the of childhood left more to itself, and when we de imagine its peculiar enjoyments and aspirations complains that his father often required more tha

ally early age by example, precept, and practice the of common application to difficult work. The of Mill was taught thus early to take his chief n of overcoming intellectual difficulties, and to realize mmand of general terms, accounts for the singular ge and unparalleled ease which he acquired in the ent of political and social generalizations, not in abstract way, but in close relation with facts. n the intellectual side, and on the moral side the s almost from the dawn of consciousness instructed rd himself as consecrated to a life of labour for the good; his ambition was kindled to follow in the s of the great men of all ages, and at the same he utmost care was taken to purify that ambition worthy motives.

ontemporary record of Mill's life from eight to is published in Dr Bain's sketch of his life. It that the *Autobiography* rather understates than te the amount of work done. At the age of eight n Latin, Euclid, and algebra, and was appointed aster to the younger children of the family—a reasonably be expected of him, but his tasks were severe as to prevent him from growing up a healthy, and high spirited boy, though he was not constitu robust, and his tastes and pursuits were so differen those of other boys of the same age.

Most of Mill's fifteenth year was spent in France family of Sir Samuel Bentham. Away from his he maintained his laborious habits; the disciplin Copious extracts from a diary kept by him at th are given by Dr Bain, and show how methodical necessarily he read and wrote, studied botany, advanced mathematical problems, made notes on the and the people and customs of the country. On his in 1821 he continued his old studies with the add some new ones. One of the new studies was Rom which he read with John Austin, his father havi decided on the bar as the best profession open Another was psychology. In 1823, when he ha completed his seventeenth year, the notion of the l livelihood was abandoned, and he entered as a clerk examiner's office of the India House. "with the

g that he should be employed from the beginning
aring drafts of despatches, and be thus trained up
cessor to those who then filled the highest depart
f the office."
s work at the India House, which was henceforth
lihood, did not come before the public, and those
ve scouted his political writings as the work of an
t philosopher, entirely unacquainted with affairs,
nored the nature of his duties. From the first he
re than a clerk, and after a short apprenticeship he
omoted, in 1828, to the responsible position of
t examiner. The duty of the so-called examiners
examine the letters of the agents of the Company
a, and to draft instructions in reply. The character
Company's government was almost entirely depend
n their abilities as statesmen. For twenty years,
836 to 1856, Mill had charge of the Company's
s with the native states. In the hundred of
hes that he wrote in this capacity, much, no doubt,
ne in accordance with established routine, but few
en of his generation had a wider experience of the
ible application of principles of government to
emergencies. That he said so little about this work
Autobiography was probably because his main con
ere was to expound the influences that affected his
and mental development. A man of different
ament might have found abundance of dramatic
in watching the personal and political changes in
y distinct states. But Mill makes no reminiscences
kind, nor does he give any clue to the results of
initiative.
eturn to his extra official activity, which received an
se impulse about the time of his entering the India
from what must strike a man of the world as a strange
The reading of Dumont's exposition of Bentham's
es in the *Traité de Législation* was an epoch in
ife. It awoke in him an ambition as enthusiastic
passioned as a young man's first love. The
ge that he uses about it in his autobiography reveals
th of inner life that few people would suspect from
ord of his dry studies. When he laid down the last
, he says, he had become a different being. It
nity to the detached and fragmentary component
f his knowledge and beliefs. "I now had opinions
l, a doctrine, a philosophy in one among the best
of the word, a religion, the inculcation and diffusion
ch could be made the principal outward purpose of
And I had a grand conception laid before me of
s to be effected in the condition of mankind through
octrine." He had been carefully bred to contemplate
or human welfare as the ruling motive of his life:
otive had now received definite direction.
y a youth has entered the world with ambition
y high, but few have felt as Mill felt the first shock
pair, and fewer still have rallied from that despair
uch indomitable resolution. The main secret of the
"crisis" of his youthful life is probably to be found
lofty ardour of the aspirations then conceived and
l. For four years he worked with faith and hope in
ssion, and these were years of incessant propagandism
y. The enthusiast of seventeen, burning to reorganize
affairs so as to secure the greatest happiness of the
st number, set siege to the public mind through
l approaches. He constituted a few of his youthful
s, imbued with the principles of his new creed, into
ety which he called the "Utilitarian" Society, taking
ord, as he tells us, from one of Galt's novels. Two
apers were open to him—the *Traveller*, edited by a
of Bentham's, and the *Chronicle*, edited by his
's friend Black. One of his first efforts was a solid
argument for freedom of discussion, in a series of l
to the *Chronicle* apropos of the prosecution of Ri
Carlile. But he watched all public incidents w
vigilant eye, and seized every passing opportunit
exposing departures from sound principle in parli
and courts of justice. Another outlet was opened
him in 1821 by the starting of the *Westminster R*
and still another in the following year in the *Parliamen*
History and Review. This year also he found a con
occupation in editing Bentham's *Rationale of Ju*
Evidence. Into this he threw himself with zeal. A
the time, his mind full of public questions, he disc
and argued eagerly with the many men of promis
distinction who came to his father's house. He en

general philanthropy, he had been careless of or keeping personal attachment. But it was not pair first seized him, as he looked back at the of the results of his work as an apostle, that Mill o feel the void in his affections and the need of sympathy. We must remember how little when oition was formed he knew of the living world him He knew in term that political and social must be slow, he could why per patience to him- l say to himself that he life must be happy because inment of his great object must occupy the whole ut without experience he could not have been l for the actual slowness of the reformer's work, or gainst its terribly oppressive influence. Inevitably erated the solidity and strength of the forces against him Four years seems a long time at that n 1826 Mill could look back to four years of eager What were the results? He had become convinced , comrades in the Utilitarian Society, who never ed more than ten, had not the stuff in them for a aking propaganda; the society itself was dissolved; *Elementary Exercise* was a failure; the *Westminster* pay it expenses; Bentham's *Judicial Evidence* pro- tte effect on the reviewers. His own reception at ulative Debating Society, where he first measured gth in public conflict, was calculated to produce rust. He found himself looked upon with curiosity ocious phenomenon, a "made man," an intellectual set to grind certain tunes. The most clear and easoning failed to sway his audience Great things n expected of this society as a means of bringing for close discussion the leading young men then e life or looking forward to it. Its first session fiasco. The leaders that had been expected stayed With these repulses to his hopes along the whole us activity, Mill must also have suffered from the exhaustion that only the hope and heat of the d kept him from feeling before No wonder that disheartened, began to feel defect in his father's , to question and analyse his own faith, to yearn solace of personal affection, and to reconstitute his of life.

n spite of this rude shock the foundations laid by training remained stable appears from the facts through the period of his gloom he continued as before, and that he considered himself bound, vinced that his old plan of life was sufficient, to p a thoroughly reasoned new plan wherewith to w heart and hope to his work. The new system ch less different from the old than might be sup- on what he says of the struggle that it cost him h it. Regard for the public good was still his the ruling motive that gave unity to his conduct now recognized that this was too vague and ab- an object to be sufficient of itself for the satisfac- human affections. It is a proof of the dominating his father's character that it cost the younger Mill effort to shake off his stern creed about poetry rsonal emotion Like Plato, the elder Mill would t poets and to be ministers of prejudice and s of truth And he often insisted on the wisdom ieting as much as possible the private affections, xpanding as much as possible the public affections. s maxim of "few acquaintances, fewer friends, no ntles" had his cordial approval. These doctrines nger Mill at first took up with boyish enthusiasm dantry, but it was against this part of his father's hat he now felt himself forced in reason to revolt. d too much in awe of his father to make him the t of his difficulties. He wrestled with them in the gloomy solitude of his own mind. He was victorious; he reached firm ground at last; but the struggle left him in several respects changed. He carried out of the struggle as the fruits of victory a more catholic view of the elements of human happiness, a delight in the poetry of nature and the affections as well as the poetry of heroic unselfish character and action, a disposition to study more sympathetically the point of view of opponents, a more courteous style of polemic, a hatred of sectarianism, an ambition no less noble and disinterested but moderated to practical possibilities.

In the course of the next few years Mill wrote comparatively little, but he "carried on," as he says, "a quantity of thinking respecting a host of subjects." It was a period of search, deliberation, germination, and striking root. Coincident if not causally connected with the relief from his spiritual crisis came his first consciousness of power as "an original and independent thinker." In the dialectic conversations with a small band of students at Grote's house, he regained the self-confidence that had been shaken in the larger and rougher arena of the Speculative Debating Society. The beginning of his works on logic and political economy may be traced back to those discussions, and he learnt from them, he tells us, the habit of "never accepting half solutions of difficulties as complete; never abandoning a puzzle, but again and again returning to it until it was cleared up; never allowing obscure corners of a subject to remain unexplored, because they did not appear important; never thinking that he perfectly understood any part of a subject until he understood the whole." He learnt also an important moral lesson from the Speculative Society, besides learning the strong points of other political and social creeds and the weak points of Benthamism from defending it point by point against all comers. With all his despondency, he did not abandon the meetings of the society after the fiasco of the first session. He stood by it firmly, and in a short time had the triumph of seeing its debates famous enough to attract men with whom it was profitable for him to interchange opinions, among others Maurice and Sterling. He ceased to attend the society in 1829, but he carried away from it the strengthening memory of failure overcome by persevering effort, and the important doctrinal conviction that a true system of political philosophy was "something much more complex and many-sided than he had previously had any idea of, and that its office was to supply, not a set of model institutions, but principles from which the institutions suitable to any given circumstances might be deduced."

The first sketch of Mill's political philosophy appeared in a series of contributions to the *Examiner* in the autumn of 1830 on "Prospects in France." He was in Paris soon after the July Revolution, made the acquaintance of the leading spirits among the younger men; and in his discussion of what they were doing and what they should do in making a new constitution we find the germs of many thoughts afterwards more fully developed in his *Representative Government*.

The division of a man's life into periods must always be a rough partition, but we may conveniently and with tolerable accuracy take these letters as marking the close of his period of meditative search, of radication, and his return to hopeful aspiring activity. It was characteristic of the nature of the man that he should be stirred to such delight by the Revolution in France, and should labour so earnestly to make his countrymen understand with what gravity and sobriety it had been effected. Their own Reform Bill came soon after, and it is again characteristic of Mill—at once of his enthusiasm and of his steady determination to do for humanity the work that nobody else

able or willing to do—that we find him in the heat struggle in 1831 writing to the *Examiner* a series ors on "The Spirit of the Age" which drew from the exclamation, "Here is a new mystic!" We ily see now what it was in these remarkable essays scinated Carlyle; it was the pervading opinion that y natural state of society power must be in the of the wisest. This was the condition of stability: power and wisdom ceased to coincide, there was a bance of the equilibrium till this coincidence was effected. But whether Carlyle was right in the "mystic" may be judged from the fact that Mill's ve logic was the direct result of his aspirations after al stability as determined by the dominion of the "Why is it," he asked, "that the multitude accept tly the decisions of the wisest, of the specially , in physical science?" Because in physical science s all but complete agreement in opinion. "And why greement?" Because all accept the same methods estigation, the same tests of truth. Is it possible o obtain unanimity as to the methods of arriving at sions in social and political matters, so as to secure agreement of opinion among the specially skilled, imilar general respect for their authority?" The hought appears in a review of Herschel's *Natural ophy*, written about the same time. Mill remarks he uncertainty hanging over the very elements of and social philosophy proves that the means of g at the truth in those sciences are not yet properly tood. "And whither," he adds, "can mankind so ageously turn, in order to learn the proper means, form their minds to the proper habits, as to that of knowledge in which by universal acknowledg- he greatest number of truths have been ascertained, e greatest possible degree of certainty arrived at?"

1831 Mill's enthusiasm for humanity had been ghly reawakened, and had taken the definite shape spiration to supply an unimpeachable method of for conclusions in moral and social science. From atform on which Carlyle and Mill met in 1831 they ed different roads,—the one to preach the duty of nce to the wisest, the other to search for a means by wisdom might be acquired such as would command t and win the assent of free conviction. No mystic worked with warmer zeal than Mill. But his zeal ntered a check which baffled him for several years, hich left its mark in various inconsistencies and rences in his completed system. He had been bred father in a great veneration for the syllogistic logic antidote against confused thinking. He attributed early discipline in this logic an impatience of vague ge which in all likelihood was really fostered in him study of the Platonic dialogues and of Bentham, for ays had in himself more of Plato's fertile ingenuity vassing the meaning of vague terms than the school rigid consistency in the use of them. Be this as it nthusiastic as he was for a new logic that might ertainty to moral and social conclusions, Mill was no esolute that the new logic should stand in no onism to the old. In his *Westminster* review of ely's *Logic* in 1828 (invaluable to all students of the s of Mill's logic) he appears, curiously enough, as an and brilliant champion of the syllogistic logic against ers such as the Scotch philosophers who talk of rseding" it by "a supposed system of inductive" His inductive logic must "supplement and not sede." It must be concatenated with the syllogistic the two to be incorporated in one system. But for l years he searched in vain for the mean tion.

Meantime, while recurring again and again, as was custom, to this cardinal difficulty, Mill worked indefatig in other directions where he saw his way clear, expatia over a wide range of political, social, economical, philosophical questions. The working of the new ord France, and the personalities of the leading men, had a found interest for him; he wrote on the subject in *Examiner*. He had ceased to write for the *Westmi* in 1828; but during the years 1832 and 1833 he tributed many essays to *Tait's Magazine*, the *Jurist*, the *Monthly Repository*. In 1835 the *London Revie* started, with Mill as editor; it was amalgamated with *Westminster* in 1836, and Mill continued editor till 1 Much of what he wrote then was subsequently incorpo in his systematic works, some of his essays were repr in his first two volumes of *Dissertations and Discus* (1859). The essays on Bentham and Coleridge constit the first manifesto of the new spirit which Mill soug breathe into English Radicalism. But the reprinted pa give no just idea of the immense range of Mill's energ this time. His position in the India Office, where h he did work enough for most men, cut him off entering parliament, but he laboured hard th ineffectually to influence the legislature from withou combating the disposition to rest and be thankful. his *Autobiography* he admits that the attempt to fo Radical party in parliament at that time was chimeri

It was in 1837, on reading Whewell's *Inductive Sc* and re-reading Herschel, that Mill at last saw his clear both to formulating the methods of scientific in gation and joining on the new logic as a supplement t old. Epoch making as his logic undoubtedly was, the multitude of new views opened up, from the ado of a new wing to the rambling old building, and fro inspiring force with which every dusty chamber searched into and illuminated, Mill did not escape a innumerable pitfalls of language that beset the pione such a subject. It is evident from a study of his pur and the books from which he started that his perplexities were due to his determination to ex scientific method as the complement of scholastic In his defence of the syllogism he confounds the syllo forms with deductive reasoning. Every deductive re ing may be thrown into the form of a syllogism, bu every syllogism is deductive. The reasoning in seve the syllogistic forms is not deductive at all in the of involving a movement from general to parti Although he knew Aristotle in the original, Mill di recognize the fact that the syllogistic machinery primarily constructed for the reasoning together of t As regards the word induction, Mill uses it in diff connexions to cover three or four distinguishable mea

induction viewed as the establishment of predic about a general term, induction viewed as inference the known to the unknown, induction viewed as ve tion by experiment, and induction viewed as the pro propositions of causation. The form of his systen really governed by the scholastic notion of induction means of establishing general propositions; the indu part of his system is introduced after the deductive this character, while the greater portion of the subs of what he treats of under the name of induction especially the so-called experimental methods, have no whatever to do with the establishment of general pr tions, in the technical sense of general propositions.

But the permanent value and influence of Mill's indu logic is not to be measured by technical inaccuracie inconsistencies, to which an academic mind may attach undue importance. In the technical history science, Mill's *Logic* may be viewed as an attempt to

ctical tests of truth set forth in Herschel's *Discourse ural Philosophy* with the theoretic views of induc- opounded in Whately's *Logic*. But in the history ght the great importance of the work i due not so o its endeavour to formulate the methods of science y bare the first principles on which they rest as to ematic application of scientific method to what he the *moral sciences*. Mill ha often been criticized had pretended to teach men how to conduct their gation and how to make discoveries in the physical s. His work was rather to evince from the practice of science the principles on which they proceed in and proving their speculations concerning cause ect in the physical world and see whether the same h could not be applied in testing and proving tion concerning cause and effect in the moral What is the effect upon human character and happiness of given social and physical conditions- , an intuition, customs, law ? How can conclusions ich points be proved ? These were the questions h Mill was interested, and the striking novelty of l was its endeavour to show that propositions of nd effect in human affairs must be proved, if they ot proof at all, absolute or approximate, on the rinciples with propositions of cause and effect in tural world

Logic was published in 1843. In 1844 appeared *ssays on Some Unsettled Questions in Political gy*. The e essays were worked out and written ears before, and show Mill in his first stage as a l economist. Four out of the five essays are te and powerful solutions of perplexing technical s—the distribution of the gains of international ree, the influence of consumption on production, the on of productive and unproductive labour, the pro ations between profits and wages. Though Mill here purely as the disciple of Ricardo, striving nore precise statement, and reaching forward to consequences, we can well understand in reading ssays, searching, luminous, large and bold in outline, wrought in detail, how about the time when he first d them he began to be conscious of power as an l and independent thinker

originality and independence became more con , when he reached his second stage as a politica ist, struggling forward towards the standpoint hich his systematic work was written It would at in his fits of despondency one of the thought- upon him like a nightmare and marred his dream- an improvement was the apparently inexorable of economic laws, condemning thousands of s to a cramped and miserable existence, and nd soon to semi-starvation. From the oppressive he found relief in the thought set forth in the of the second book of his *Political Economy* that, the condition of production have the necessity of l law the distribution of what is produced among rious classes of producers is a matter of human ement, dependent upon alterable customs and tions. There can be little doubt that this thought, r or not in the clear shape that it afterwards d, was the germ of all that is most distinctive in tem of political economy It was as far as possible he rigidity of his method of exposition to fall into nfusion of supposing that it was for political y to discuss the equity of different modes of ution, or the value of other objects of human our conflicting with the production of wealth ; but economic inquiries clearly in their proper place as to conclusions that were not always final and bind- ing on the practical statesman, but had to be take other considerations as governing rational human Besides thus putting political economy in its just tion with other parts of social science and conduc widened the scope of economic inquiries by discussi economic consequences of various ideal social arrange and more especially different modes of distributing between landlord, capitalist, and labourer. Mill re redeemed political economy from the reproach of dry science. Nobody with any interest in human im ment can read his work with indifference. And this without in any way disturbing the original con of political economy as the science of cause and e the production of wealth. One of his most e successors, the late Professor Cairnes, thus adm summed up his work as a political economist: " himself used to put it, Ricardo supplied the backb the science, but it is not less certain that the hum joints, the muscular developments all that political economy a complete and organized bo knowledge have been the work of Mill."

While his great systematic works were in pr Mill wrote very little on events or books of the day turned aside for a few months from his *Political E* during the winter of the Irish famine (1846- advocate the creation of peasant-proprietorships remedy for distress and disorder in Ireland. He time also to write elaborate articles on French histo Greek history in the *Edinburgh Review* apropos of M Guizot, and Grote, besides some less elaborate essay

The *Political Economy* was published in 1848 could now feel that the main work he had propo himself was accomplished; but, though he wrote co tively little for some years afterwards, he remai much as ever on the alert for opportunities of influence, and pressed on with hardly dim enthusiasm in his search for useful truth. Amon things, he made a more thorough study of socialist with the result that, though he was not converted of their schemes as being immediately practical began to look upon some more equal distribution produce of labour as a practicability of the remote and to dwell upon the prospect of such changes in character as might render a stable society possible the institution of private property. This he has ca third stage as a political economist, and he says was helped towards it by the lady, Mrs Taylor, who hi- wife in 1851, and with whom he had lived in i friendship for more than twenty years before. generally supposed that he writes with a lover's e rance about this lady's powers when he compares h Shelley and Carlyle But a little reflexion will sho he wrote with his usual accuracy and sobriety w described her influence on him. He expressly sa he owed none of his technical doctrine to her, t influenced only his ideals of life for the individual society, and his language about her is really measure of the importance that he attached to such above any system of reasoned truth. There is ver proportional difference between Mill and his fathe it is obvious from what he says that his inner life very different after he threw off his father's au This new inner life was strengthened and enlarged Taylor. We must remember also that Mill in hi years had been so strictly secluded from comm sentiment that what the general world would c commonplace must have come to him with all the fr of a special revelation.

During the seven years of his married life Mill pu less than in any other period of his career, but four

osely reasoned and characteristic works, the *Liberty*, *litarianism*, the *Thoughts on Parliamentary Reform*, e *Subjection of Women*, besides his posthumously ed essays on *Nature* and on the *Utility of Religion*, ought out and partly written in collaboration with e. In 1856 he became head of the examiner's n the India House, and for two years, till the tion of the Company in 1858, his official work, a light task, kept him fully occupied. It fell to head of the office to write the defence of the ny's government of India when the transfer of its was proposed. Mill was earnestly opposed to the , and the documents in which he substantiated the boast for the Company that "few governments even far more favourable circumstances have attempted h for the good of their subjects or carried so many r attempts to a beneficial issue," and exposed the of the proposed new government, are models of nt and dignified pleading. His prediction that the Secretary's council would serve as a screen and a check was in the opinion of many amply verified ears ago.

he dissolution of the Company, Mill was offered a the new council, but declined. His retirement ficial work was followed almost immediately by his death, and from this calamity he sought relief in literary occupation. Politics, sociology, and psycho vided as before the energies of his active mind. f his first cares was to publish with a touching ion to his wife the treatise on *Liberty*, which they ought out together, principle by principle and e by sentence. This pious duty discharged, he to current politics, and published, in view of the ng Reform Bill, a pamphlet on parliamentary The chief feature in this was an idea concerning he and Mrs Mill often deliberated, the necessity nding checks against uneducated democracy. His suggestion of a plurality of votes, proportioned to tor's degree of education, was avowedly put forward an ideal; he admitted that no authentic test of on could for the present be found. An anonymous vative caught at the scheme in another pamphlet, ng income as a test. Soon after, Mill supported ser's, still with the same object, Mr Hare's scheme representation of minorities. In the autumn of me year he turned to psychology, reviewing Mr works in the *Edinburgh Review*.

his way the indefatigable thinker worked on, throw nself by turns into the various lines along which he spects of fulfilling his mission as an apostle of pro In his *Representative Government* (1860) he systema- pinions already put forward in many casual articles says. His *Utilitarianism* (published in *Fraser's* m was a closely reasoned systematic attempt to answer ons to his ethical theory and remove misconceptions As the inventor of the term Utilitarianism, he was l to define its meaning; and he was especially s to make it clear that he included in utility the es of the imagination and the gratification of the emotions, and to show how powerfully the good of od as a motive appealed to the imagination. His e on the *Subjection of Women*, in its ruling intention est against the abuse of power, was Mill's next work, it was not published till 1869. His *Examination milton's Philosophy*, published in 1865, had engaged share of his time for three years before. When it curred to him that a criticism of the chief of our intuitional psychologists would cause a wholesome d serve enlightenment, he thought only of an article s he wrote about Austin's *Jurisprudence* or Grote's *Plato*. But he soon found that the subject required and a book appeared which certainly answered the of rousing the sleepy realms of philosophy and theo

While mainly occupied in those years with philos studies, Mill did not remit his interest in current He made his voice heard on the contest in Ame 1862, taking the side of the North then very unp in London and using all his strength to explain w since been universally recognized as the issue re stake in the struggle, the abolition of slavery. characteristic of the closeness with which he w current events, and of his zeal in the cause of "hu that, when the *Reader*, an organ of science and imp opinion, fell into difficulties in 1865, Mill joined wit distinguished men of science and letters in an effort t it afloat. He supplied part of the money for carr on, contributed several articles, and assisted the Mr Fraser Rae, with his advice. The effort was though such men as Herbert Spencer, Huxley, T Cairnes, Mark Pattison, F. Harrison, Sir Frederick P and Lecky were among the contributors.

In 1865 a new channel was opened to his infl He was requested to stand for Westminster, and on conditions strictly in accordance with his princi parliamentary election. He would not canvass, n agents to canvass for him, nor would he engage to to the local business of the constituency. He wa difficulty persuaded even to address a meeting electors. The story of this remarkable election ha told by Mr James Beal, one of the most active sup of Mill's candidature. In parliament he adhered lifelong principle of doing only work that needed done, and that nobody else seemed equally able or to do. It may have been a consciousness of th which prompted a remark made by the Speaker that presence in parliament elevated the tone of debate, impression made by him in parliament is in some of being forgotten, because he was not instrumen carrying any great measure that might serve as an memorial. But, although in one of his first sp against the suspension of the Habeas Corpus Act in he was very unfavourably received, Mill thou succeeded in what recalled "gaining the ear of the The only speech made by him during his three y parliament that was listened to with impatience errors-ly enough, his speech in favour of counte democracy by providing for the representation of min His attack on the conduct of General Eyre in J was listened to, but with repugnance by the ma although his action in the matter in and out of parl was far from being ineffectual. He took an active the debate on Mr Disraeli's Reform Bill, and he extort from the Government several useful modifi of the Bill for the Prevention of Corrupt Practices reform of land tenure in Ireland, the representa women, the reduction of the national debt, the re London government, the abrogation of the declara Paris, were among the topics on which he spok marked effect. He took occasion more than o emphasize what he had often advocated in writing, En duty to intervene in Continental politics in support cause of freedom. As a speaker Mill was sor hesitating, pausing occasionally as if to recover the of his argument, but he showed great readiness in parliamentary debate. Viewed as a candidate for min office, he might be regarded as a failure in parliame there can be no doubt that his career there greatly e his influence.

Mill's subscription to the election expenses Bradlaugh, and his attitude towards Governor E

ally regarded a[s] the main cause[s] of his defeat in the
l election of [1]. But, a[s] he suggest himself, his
d advocacy of unfamiliar p[rinci]ples had made
npopular with [the] moderate [party]. When he was

aniel vi. 27; Sibyll. iii. 49 *sq.*, 766; Pss. Solom.
; Enoch lxii. 14), and this seems always to have
e most widely accepted view (John xii. 34). But
comparison of prophetic passages of the Old Testa
earned apocalyptic writers came to the conclusion
distinction must be drawn between the earthly
nce of the Messiah and the appearance of God
f amongst His people and in the Gentile world for
l judgment. As a necessary consequence, a limited
had to be assigned to the Messianic kingdom. It
altogether improbable that the mysterious references
sufferings of the Messiah had also an influence on
inds. This, however, is doubtful. It is certain at
nts that the whole conception marks the beginning
dissolution of realistic and sensuous views of the
The age was too advanced to regard the earthly
ic kingdom as the end. There was an effort to
lace among the hopes of the future for those more
l and universal anticipations, according to which
and heavenly blessedness will be the portion of the
, this earth and heaven will pass away, and God
all in all. As to the period to be assigned to the
kingdom, no agreement was ever reached no
n, any more than in the detailed descriptions of its
d pleasures. According to the Apocalypse of Baruch
this kingdom will last "donec finiatur mundus
ionis." In the Book of Enoch (xci. 12) "a week"
fied, in the Apocalypse of Ezra (vii. 28 *sq.*) four
hundred years. This figure, corresponding to the
hundred years of Egyptian bondage, occurs also
Talmud (Sanhedrin 99*a*). But this is the only p
the Talmud has no fixed doctrine on the point
view most frequently expressed there (see Von
Hilgenfeld's Zeitschrift, 1877, p. 527 *sq.*) is th
Messianic kingdom will last for one thousand (so
two thousand) years. "As in six days God created
world, on the seventh He rested. But a day of
equal to a thousand years (Ps. xc. 4). Hence the
will last for six thousand years of toil and labour
will come one thousand years of Sabbath rest for the
of God in the kingdom of the Messiah." This idea
have already been very common in the first century
Christ. The combination of Gen. i., Dan. ix., and
was peculiarly fascinating:

"As the Holy One had spent only one return of
of Man. He returns to judgment. In speaking of
of the glorious kingdom He is to introduce, He ma
of apocalyptic and even (Matt. xxiv. 11, xxvi. 29, Luke
16; Matt. xix. 28), but nowhere in the discourses
Jesus is there a hint of a limited duration of the M
kingdom. The apostolic epistles are equally free
any trace of chiliasm (neither 1 Cor. xv. 23 *sq.* nor
iv. 16 *sq.* points in this direction). In the Apocaly
John, however, it occurs in the following shape (cha

ceived of the Apocalypse of John as a book of riddles
ence; powerful was the reaction (in the so-called
n the controversy (c. 160–220) one of the principal
nvolved was the continuance of the chiliastic
ations in the Church. The Montanists of Asia
defended them in their integrity, with one slight
cation they expected that Pepuza, the city of
ns, would be the site of the New Jerusalem and
illennial kingdom. Modifications of this kind,
have often appeared in later times in connexion
he revival of millenarianism, are a striking evidence
tendency of every sect to regard its own little
er hope as the centre of the world and its fortunes as
rned of universal history. After the Montanistic
ersy, chiliastic views were more and more
ted in the Greek Church; they were, in fact,
ized as "Jewish" and consequently "heretical."
the Alexandrian theology that superseded them;
that is to say, Neo-Platonic mysticism triumphed
the early Christian hope of the future, first among
"cultured," and then, when the theology of the "cult
had taken the faith of the "uncultured" under its
tion, amongst the latter also. About the year 2
Egyptian bishop, Nepos, in a treatise called Ἐλεγχος
ἀλληγοριστων, endeavoured to overthrow the Origenistic
theology and vindicate chiliasm by exegetical means.
Several congregations took his part; but ultimately
Dionysius, bishop of Alexandria, succeeded in healing
the schism and asserting the allegorical interpretation
the prophets as the only legitimate exegesis. During
controversy Dionysius became convinced that the
of my great theology over "Jewish" chiliasm would
be overcome so long as the Apocalypse of John passed
an apostolic writing and kept its place among
homologoumena of the canon. He accordingly raised
question of the apostolic origin of the Apocalypse; and
reviving old difficulties, with ingenious arguments
own, he carried his point. At the time of Eusebius
Greek Church was saturated with prejudice against
book and with doubts as to its canonicity. In the
of the 4th century it was removed from the
canon, and thus the trouble-some foundation on
chiliasm might have continued to build was got
The attempt of Methodius of Tyre at the beginning
the 4th century and Apollinarius of Laodicea
360 to defend chiliasm and assail the theology of
had no result. For many centuries the Greek Church
the Johannine Apocalypse out of its canon, and consequently
chiliasm remained in its grave. It was considered
sufficient safeguard against the spiritualizing eschatology
of Origen and his school to have preserved the main dogma
of the creed and the *regula fidei* (the visible advent of
Christ, eternal misery and hell-fire for the wicked).
Anything beyond this was held to be Jewish. Not
only the chronologers and historians of the church,
following Julius Africanus, made use of apocalyptic
numbers in their calculations, while court theologians like
Eusebius entertained the imperial table with discussions
to whether the dining-hall of the emperor the throne of
David and Solomon, the beloved of God—might not be the
New Jerusalem of John's Apocalypse. Eusebius was
the first who dabbled in such speculations. Dionysius of
Alexandria had already referred a Messianic prediction of
the Old Testament to the emperor Gallienus. Such extremism and political servility between them gave the
death-blow to chiliasm in the Greek Church. It has
again obtained a footing there; for, although, late in the
Middle Ages, the Book of Revelation by what means we
cannot tell did recover its authority, the church of
that time so hopelessly trammelled by a magical cultus
to be incapable of such developments. In the Eastern
churches of the East (the Syrian, Arabian, and Æthiopian)
and in that of Armenia, the apocalyptic literature
preserved much longer than in the Greek Church. They
were very conservative of ancient traditions in general,
hence chiliasm survived amongst them to a later date
in Alexandria or Constantinople. It is to these churches
that we are mainly indebted for the extensive remains of
the old apocalyptic literature which we now possess. The
remote churches of the East Europe has recovered in
the last forty years many works of this kind which
enjoyed the highest repute throughout Christendom.

But the Western Church was also more conservative
than the Greek. Her theologians had, to begin with, no
turn for mystical speculation; their tendency was rather
to reduce the gospel to a system of morals. Nay, with
the moralists chiliasm had a special significance as the
distinguishing feature of the gospel, and the only

ve a specifically Christian character to their system. owever, holds good of the Western theologians only ne middle of the 3d century. The earlier fathers, s, Hippolytus, Tertullian, believed in chiliasm because it was a part of the tradition of the church ause Marcion and the Gnostics would have nothing ith it. Irenæus (v. 28, 29) has the same conception millennial kingdom as Barnabas and Papias, and in support of it to the testimony of disciples of the s. Hippolytus, although an opponent of Montanism, verthelss a thorough-going millenarian (see his *De Antichristo*). Tertullian (*cf.* especially *Adv. n.*, 3) aimed at a more spiritual conception of the ial blessings than Papias had, but he still adhered, lly in his Montanistic period, to all the ancient ations. It is the same all through the 3d and 4th es with those Latin theologians who escaped the ce of Greek speculation. Commodian, Victorinus ensis, Lactantius, and Sulpicius Severus were all ined millenarians, holding by the very details of mitive Christian expectations. They still believe

did, in the return of Nero as Antichrist, they peet that after the first resurrection Christ will reign is saints "in the flesh" for a thousand years. Once, ly once (in the Gospel of Nicodemus), the time is d to five hundred years. Victorinus wrote a ntary on the Apocalypse of John, and all the ians, especially Lactantius, were diligent students ancient Sibylline oracles of Jewish and Christian and treated them as divine revelations. As to the nity and apostolic authorship of the Johannine ypse no doubts were ever entertained in the West, an Apocalypse of Peter was still retained in the in the 3d century. That of Ezra, in its Latin tion, must have been all but a canonical book. mbers of extant manuscripts of the so-called 4 Ezra incredibly great, while several of them are found es of the Latin Bible at the beginning of the 16th y. The Apocalypse of Hermas was much read till rough the Middle Ages, and has also kept its place e Bibles. The apocalyptic "Testamenta duodecim charum" was a favourite reading book, and Latin ns of ancient apocalypses are being continually t to light from Western libraries (*e.g.* the *Assumptio* the *Ascensio Jesaiæ*, &c.). All these facts bear igorously the early hopes of the future maintained lves in the West. In the hands of monastic theo

s, like Lactantius, they certainly assume a somewhat ique form, but the fact that they cling to them clearest evidence that in the West millenarianism ill a point of "orthodoxy" in the 4th century. s state of matters, however, gradually disappeared he end of the 4th century. The change was brought by two causes, - first, Greek theology, which reached est chiefly through Jerome, Rufinus, and Ambrose, econd, the new idea of the church wrought out by tine on the basis of the altered political situation of urch. Jerome, the pupil of the Greeks, took him eady emancipated from "opiniones Judaicæ"; he les the old anticipations; and, though he does not e to reject them, he and the other disciples of the s did a great deal to rob them of their vitality. At me time the influence of Greek theology was by no so great in the West that this of itself could have ossed chiliastic views. It was reserved for Augustine a direction to Western theology which carried it of millenarianism. He himself had at one time ed in it; he too had looked forward to the holy th which was to be celebrated by Christ and His on earth. But the signs of the times pointed to a different prospect. Without any miraculous interpo of God, not only was Christianity victorious on ear the church had attained a position of supremacy. old Roman empire was tottering to its fall; the stood fast, ready to step into its inheritance. It w imply that the world power, the enemy of Chris been vanquished, the fact was that it had gra abdicated its political functions in favour of the Under these circumstances Augustine was led, in h troversy with the Donatists and as an apologist, to r the political side of the catholic church, - to gra elaborate the idea that the church is the kingdom of and the city of God. Others before him may have the same view, and he on the other hand never forg true blessedness belongs to the future, but still he w he it who ventured to teach that the catholic church, empirical form, was the kingdom of Christ, th millennial kingdom had commenced with the appear Christ, and was therefore an accomplished fact. I doctrine of Augustine, the old millenarianism, thou completely extirpated, was at least banished from the of dogmatic. For the official theology of the chu very soon became a thing of the past, certain eleme it were even branded as heretical. It still lived on ever, in the lower strata of Christian society, a certain undercurrent of tradition it was transmitte century to century. At various periods in the his the Middle Ages we encounter sudden outbre millenarianism, sometimes at the foot of a mou sometimes as a far-reaching movement. And, since been suppressed, not, as in the East by mystical tion, its mightiest antagonist, but by the political of the hierarchy, we find that wherever chiliasm in the Middle Ages it makes common cause w enemies of the secularized church. It strengthen hands of church democracy, it formed an allianc the pure souls who held up to the church the i apostolic poverty, it united itself for a time eve mystic-m in a common opposition to the supremacy church; nay, it lent the strength of its conviction support of laity and prince in their effort to bre political power of the church. It is sufficient to re well-known name of Joachim of Floris, of all the m Franciscan spiritualists, of the leading sectaries fr 13th to the 16th century who assailed the papa the secularism of the church, above all, the n Occam. In the times the millenarian mood of the church came to life again, and in the revolutionary ments of the 15th and 16th centuries especially Anabaptist movements - it appears with all its old pressing energy. If the church, and not the ta regarded as Babylon, and the pope declared to Antichrist, these were legitimate inferences fro ancient traditions and the actual position of the But, of course, the new church was not in every identical with the old. It could not hold it without admitting certain innovations. The "eve gospel" of Joachim of Floris was a different thin the announcement of Christ's glorious return in the of heaven, the "age of the Spirit" which mystic spiritualists expected contained traits which m characterized as "modern", and the "kingdom Anabaptists in Munster was a Satanic caricatur kingdom in which the Christians of the 2d century to a peaceful Sabbath rest. Only we must not to ideas of the great apocalyptic and chiliastic move the first decades of the 16th century from the ra Munster. There were pure evangelical forces at it; and many Anabaptist need not shun compari the Christians of the apostolic and post-apostolic ag

German and Swiss Reformers also believed that the
the world was near, but they had different aims in
om those of the Anabaptists. It was not from
and apocalyptic-m that they hoped for a reforma-
the church. In contrast to the fanatics, after a
sitation they threw millenarianism overboard,
ng with it all other "Jewish notions." They

church demand special attention. But when
are made to find room for millenarianism in our
e system, it must always appear in which
d be utterly unrecognizable to the proclamation
ancient church, who, just because they were
arians, despised dogmatics, in the sense of philo-
l theology. The claim of chiliasm rests only
the acknowledgement that in former times it was
ed to all appearance unreasonably associated
he gospel itself. Those who try to reveal it
conserve it "element of truth, put contempt
while they destroy it, for it was in itself, in its
incomprehensible energy of all reason, [illegible]
event alone with the unspeakable wealth of its
hrist ion.

[illegible], *Lehrbuch der Neuen* [illegible]; Cornill, *Briefe des* [illegible]; [illegible] history of chiliasm has not yet appeared. A. HAUCK.

LLER, Hugh (1802–1856), columnist in science and
re, and one of the most remarkable among self-
men of genius, was born at Cromarty, on the north
st of Scotland, on the 10th of October 1802. He
d seafaring and from a skilled seaman who owned a
el by sailing his own boat, perished at sea when
was five years old. His mother looked much to
ort and encouragement of her son, to her two brothers, James and
ew Wright, the one a soldier, the other a seafarer.
h to piety, more religion, unflagging industry,
ittle entertainment were the lessons which these
ors seemed to preach by precept and by example, most readily
be learned. But young Miller had inherited from his
r a strong sense of duty and obstinate force of will
[illegible] to take a line of his own.
chantment of books and freedom the mere sight
of mother-of-pearl shell and by the sea mist
thirteen years old [illegible] and his schoolmaster
t it likely that he would prove a dunce. Nevertheless
truant school-boy was already giving indications of
stination of the poet. It is too early to date
found in his precocious zeal that led him to
of mechanical models. His mother summed up,
mewhat dialect of the district, the impressions derived
er son's boyhood and youth in the words, "he was
ton." But the writing, from the first and increasingly
went on, could be distinguished from the ordinary
productions of boyhood. A continuity of idea, an
finable grace and freshness, marked his perform

his life did he suffer from a thrix of words. But, b
man, he had a felicitous knack of fitting words int
right places and avoiding jerkiness and inequalit
verse he lacked the passionate intensity required fo
rhythmic movement, but he had a fine sense of c
and modulation in prose.

It is a curious fact that what determined Hugh
to apprentice himself to a stone mason was his
ry literary composition. Unemployed during the
frost, the lad, as he perceived, could enjoy for
month every year the ecstacy of writing. One re
his decision was that he never learned any langua
English. Another was that fifteen years of the quar
the hewing bed, with stern experiences of over-wo
privation, sowed in his frame the seeds of incurable
Meanwhile the disadvantages of his decision were indisp
Under the discipline of labour the refractory sch

hand, and thy soiled vestments, and thy obscure ta
thy humble cottage, and hard couch, and homely fa

It cannot be added that his fifteen years of cl
constant intercourse with fellow-workmen inspired hi
much respect for their class. He was most unfor
in his comrades during the two seasons, 1824 and
when he worked at Niddrie in the neighbourh
Edinburgh. Staunch in their enjoyments, meanly
in their class ambitions, and fatuously subject to
charlatan that Niddrie squad of reprobates which
[illegible] in *The Schools and Schoolmasters* stamped
mind of Hugh Miller an indelible conviction of th
poverty and degradation of the hand-workers.

Returning to Cromarty, he worked in happy pati
a stone cutter year after year, sedulously prosecu
the same time the grand object of his ambition, t
good English. He found time to invigorate and em
mind by careful reading, and was habitually and
observant both of man and of nature. His readi
not extensive but well chosen, and embraced Loc
Hume, Goldsmith and Addison were, more tha
others, his masters in style. It was to get time to wr
he had become a stone mason; another of the surpr
his career is that it was in advertising himself as a
that he came before the world as a literary man. M
mason, he mentioned as a poetical contributor to the *E*
Courier, might, he thought, be asked by some
readers to original inscriptions on tombs. He th
forwarded one of his verses to the editor. Thes
to have been consigned to the waste paper basket
had been the fate of an "Ode on Greece" offered
Scotsman when he was at Edinburgh. Piqued
second failure, he now resolved, at all hazards, to s
self in print. In 1829 appeared the small volume o
as *Poems Written in the Leisure Hours of a Jour*
Mason. It presented its author the valuable friend
Mr Robert Carruthers, and was favourably noticed
press. Miller looked at his poems in print, and con
at once and irreversibly, that he would not succe
poet. It was a characteristic and very manly d
proving that there was no fretting vanity in his disp
Doubtless also it was right. His field was prose,
though his poems yielded nothing in the way of f
they were a beginning of fame. The simple nat
Cromarty began to think him a wonder. Some v

nt letters on the herring fishery extended his reputation. d judges in Edinburgh detected in his work the mint k of genius, and Miller's first prose volume, *Scenes and ends of Cromarty*, was published there in 1835. In the rval he had become the accepted lover of Miss Lydia ser, a young lady of great personal attractions, rare intetual gifts, and glowing sympathy with all that was l and brave and bright. Her affection naturally dded him in his resolution to emerge from the hand rking class; the mallet and chisel gradually dropped n his grasp; and when his prose venture appeared he being initiated, in Linlithgow, into the duties of k clerk. On his return to Cromarty he found employnt in the local branch of the Commercial Bank.

He was a married man, and his tenure of a stable fixed Cromarty, when the agitation that preceded the Disup of 1843 made the air of Scotland vibrate. Miller ed his church, and deliberately threw in his lot with the uable institution possessed by the Scottish people. vently as he had sympathized with those who protested ftical representation for Scotland in the Reform Bill he more fervently took part with those who claimed that ttish congregations should have no power to call their own. In the summer of 1839 he wrote his Essays in phlet-letter to Lord Brougham, Dr Chalmers read it h "nothing short of rapture", and the latter end of 0 saw Miller installed in the editorial chair of the *Witness* spaper, published twice a week in Edinburgh to advoe the cause of non intrusion and spiritual independence. continued to edit the *Witness* till his death which took re in the night between the 23d and 24th of December 6. Unremitting brain work had overtaxed a system manently injured by the hard-ships of his early manhood; reason at length gave way, and Miller died by a pistol t fired by his own hand. A *post mortem* examination, sted by four medical men of the highest character, ced the presence of "disease of appreciable magnitude in the in, and he left a few words indicating the form taken the insane delusion which had mastered him.

During the three years preceding the Disruption, chamnship of the church by Miller did more, probably, than other single agency to win for it the sufferance of the ttish people. Months before the day of separation, name "Free Church" was prospectively adopted to party proposing to sever connexion with the state; l, whether Hugh Miller suggested the name or did not, was one of the chief architects of the institution. Nor the sequel shown that his labour was vain.

But long ere now an enthusiasm parallel in intensity h that which he felt for his country and its church, l to which even his old literary enthusiasm had become servient, had taken possession of him. From infancy had been a keenly interested observer of all natural ts and objects, and during his career as apprentice and rneyman mason he had accumulated a vast store of the rticular information belonging to the geologist. But it s not until later that he expressly undertook the study geology. We still find him, when twenty-seven, laying wn charts of study and production without a word about ence. When, however, he had convinced himself that road to the stars was not by poetry, and when the ited success of his prose tales and literary essays in the ume on Cromarty suggested a profound misgiving as the adequacy of his purely literary materials to produce important result, he bethought him of his hoard of ientific knowledge, and addressed himself with the con trated energy of mature manhood to geological reading d geological researches. These, in fact, were not new him, and he was much impressed by the interest excited ong scientific readers by a geological chapter in the *Scenes and Legends*. His chief master was Lyell he reverenced henceforward as one of the greatest o men. The principal scene of his own investigatio the Cromarty district, where he ransacked every of the hill side, and traced every stratum sawn thro the watercourse, and where, on the beach at ebb, in in clay of bluish tint and great tenacity, belonging Old Red Sandstone formation, he discovered and nodules, which, when laid open by a skilful blow hammer, displayed certain organisms that had nev seen by a human eye. He had entered upon correspo with Murchison and Agassiz, and Fellow of the Ge Society and professor of college had been brought h descriptions "to take place the rock of Cromarty with the patriotic and religious enthusiasm, then to burned within him when he went to champion his in Edinburgh, there showed, in the depths of hi not indeed a stronger but a more gentle and pe greater enthusiasm not for that science in which he excelled, he had something of his own to say, somet which the world of culture would be glad to h early as September he [illegible] there began to appear *Witness* a series of articles entitled "The Old Re stone." They attracted immediate and eager att and the month was not at an end when, at the me the British Association, Murchison brought them the notice of the geological section, presided over b Agassiz, already familiar from Miller's correspo with the organisms described, contributed note respecting them, and proposed that one of the remarkable of the fossils should be called *Pt Millerii*. Buckland joined warmly in the encom Murchison and Agassiz vowing that "he would left hand to possess such powers of description mate." The article which met with so enthus reception from the most eminent geologists m formed the nucleus of a book soon after publi entitled *The Old Red Sandstone*. It established reputation not only as an original geologist b practical thinker of great sagacity, and as a fa fascinating writer. He had at last fairly found hi it is impossible to turn from the *Scenes and Legend* new volume without feeling that the spirit of the has become more exultant, his touch at once stron more free.

Life and Letters of Hugh Miller by Peter Bayne (2 vols. London, 1871). (P. L.)

MILLER, WILLIAM (1781–1849), the founder of an
American religious sect holding peculiar millennarian views,
rn at Pittsfield, Massachusetts, in 1781. He received
mperfect education In the war of 1812 he served
ain of a battalion on the Canadian frontier While
g at Low Hampton, N.Y. he began in 1833 publicly
ure on the subject of the millennium, asserting that
cond coming of Christ would take place in about
ars. His doctrine awakened wide interest among
classes of the community In 1840 a semi-monthly
, *The Signs of the Times*, was started by one of his
rs, and two years later the *Advent Herald* made its
ance About 1843 the second coming of Christ was
ed by as many as 50,000 believers in the doctrines of Miller; and, although the disappointment of their
somewhat diminished their numbers, many continue
adherence to his tenets regarding the nature of the
mium. At present the number of Millerites or Adven
estimated at from 15,000 to 20,000. Miller died a

MILLER, WILLIAM (1796–1882), one of the g
of modern line engravers, was born in Edinburgh
28th of May 1796. After studying in London
George Cook, a pupil of Basire's, he returned
native city, where he continued to practise his art
a long interval He executed plates after Thom
Dodding ton Macculloch, D. O. Hill, Sir George L
and other Scottish landscapists, but his most adm
and most voluminous works were his transcript
Turner The first of these was the Clovelly (1824),
Southern Coast, a publication undertaken by his
and his brother William B. Cook, to which Miller al
tributed the Combe Martin and the Portsmouth
was engaged on the illustrations of *England and*
1827–38, of *The Rivers of France*, 1833–35; of
Poems, 1834, and very largely on those of *The Pr*
Poetical Works of Sir Walter Scott, 1834. In *Th*
ental Antiquities and Picturesque Scenery of Sc
1836, he executed a few excellent plates after Th
and Turner Among his larger engravings of T
works may be mentioned The Grand Canal, Venice
Rhine, Osterspey, and Feltzen; The Bell Rock; The
of London and The Shepherd. The art of William
was warmly appreciated by Turner himself, and Mr
has pronounced him to be on the whole the most suc
translator into line of the paintings of the greatest l
landscapist His renderings of complex Turneria
effects are especially delicate and masterly. Towar
end of his life Miller abandoned engraving and occup
himself more in the production of water colours, many of
were exhibited in the Royal Scottish Academy, of
he was an honorary member. He resumed his
however, to produce two final series of vignette
drawings by Birket Foster illustrative of Hood's
published by Moxon in 1871. Miller was a
respected member of the Society of Friends. H
while on a visit to Sheffield, on the 20th of J
1882.

MILLER'S THUMB (*Cottus gobio*), a well-known
fish, abundant in all rivers and lakes of northe
central Europe with clear water and gravelly b
The genus *Cottus*, to which the Miller's Thumb bel
easily recognized by its broad, flat head, rounde
scaleless body, large pectoral and narrow ventral fin
two dorsal fins, the anterior shorter than the pos
the præopercle is armed with a simple or br
spine. The species of the genus *Cottus* are rather nu
and are confined to the north temperate zone of the
the majority being marine, and known by the name of
head." The Miller's Thumb is confined to fresh
and only one other freshwater species is found in
C. poecilopus, from rivers of Hungary, Galicia, a
Pyrenees, some others occur in the fresh waters of n
Asia and North America. The Miller's Thumb is c
all notable localities in Great Britain, but is ex
rare in Ireland, in the Alps it reaches to an
exceeding 7000 feet. Its usual length is from
inches Generally hidden under a stone or in a ho
the bank, it watches for its prey, which consists
aquatic animals, and darts when disturbed with
ordinary rapidity to some other place of refuge
female deposits her ova in a cavity under a stone
the male watches and defends them until the yo
hatched and able to shift for themselves.

MILLET

LLET (French, *millet*; Italian, *miglietto*, diminutive *iglio* — Latin *mille*, a thousand, in allusion to its y) is a name applied with little definiteness to a conble number of often very variable species of cereals ging to distinct genera and even subfamilies of *inæ*. The true millet, however, is generally admitted *Panicum* (*Setaria*) *miliaceum*, L. (German *Hirse*, which *P. miliare*, Lam., is reckoned by some ists). It is indigenous to the East Indies and North dia, but is mentioned by Hippocrates and Theo ns as already cultivated in South Europe in their Some suppose it to be one of the earliest grains used ad making, and ascribe the origin of its name to *pinso*, rather than to the paniculate inflorescence. It l, requires rich but friable soil, grows to about 3 or 4 gh, and is characterized by its bristly, much branched ng panicles. One variety has black grains. It is y cultivated in India, southern Europe, and northern , and ripens as far north as southern Germany, in wherever the climate admits of the production of wine. grain, which is very nutritious, d in the form of groats, and excellent bread when mixed heaten flour. It is also largely for feeding poultry and cage for which purpose mainly it is ted. *P. italicum*, L. (*Setaria* , Beauv.), is of similar origin distribution, and is one of the wholesome and palatable Indian s. It is annual, grows 1 to 5 igh, and requires dry light soil. an Millet (*P. germanicum*, Ger *Kolbenhirse*, *Mohar*) is probably y a less valuable and dwarf y of *P. italicum*, having an compact, and shorter spike grains of both are very small, one half as long as those of on millet, but are exceedingly e. Many stalks arise from a root, and a single spike often 2 oz. of grain, the total yield five times that of wheat. They nported for poultry feeding like rmer species, but are extensively in soups, &c., on the Continent. erous other species belonging to ast genus the largest among grasses, of which

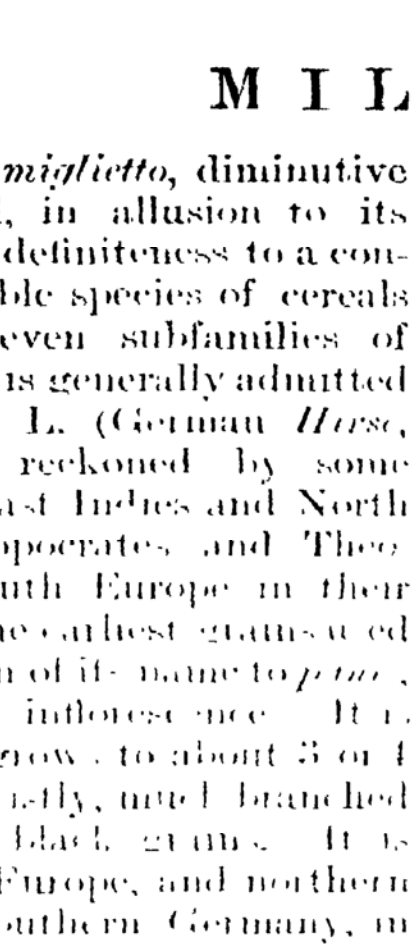

FIG. 1.—*Panicum italicum*.

ring are among the most important are also cultiin tropical or sub-tropical countries for their grain or der grasses, or both, each variety of soil, from swamp sert, having its characteristic forms. They are very y acclimatized wherever the temperature is sufficient, n Australia, and seem destined to rise in agricultural tance.

sh Millet is *P. digitaria*; *P. pennicatacum* Roxb., Shamalo, an grass, is probably a native of tropical Africa; while the ial *P. spicatum*, Roxb., also largely cultivated in tropical ies, is from Sumatra. *P. decompositum* is the Australian , its grains being made into cakes by the aborigines. *P. um*, Jacq., is the Guinea Grass; it is perennial, grows 8 feet and yields abundance of highly nutritious grain. *P. spec.* Nees., is the Coapim of Angola, but has been acclimatized in and other tropical countries. Other grain-bearing species 6 or 7 gh form the field crops on the banks of the Amazon. Of species ging to allied genera, *Pennisetum thyphoideum*, Rich. (*Penia spicata*, Willd.), Bajree, sometimes also called Egyptian , a Guinea corn, is largely cultivated in tropical Asia, Nubia, gypt. *P. distichum* grows south of the Sahara. Species of *lum*, *Eleusine*, and *Milium* are also cultivated as millets.

t the most important dry grain of the tropical countries of Africa and Asia, particularly of India, is *Sorghum* Pers. (*Holcus Sorghum*, L., *Andropogon Sorghum*, Durra, Great Millet, Indian Millet, Turkish Mi Guinea Corn (the French *sorgho*, German *Mohren hirse* or *Kaffernkorn*, Tamil *Cholam*, Bengalese *Jowaree*). It ranges probably as extensively as wheat, being also largely cultivated in southern Europe, the United States, and the West Indies. In Asia Minor, Arabia, Italy, and Spain it may be used to replace oat and barley. It is annual, and may reach 12 feet in height; it is extremely prolific, even rivalling maize, of which it is a great congener. Its flour is very white, but does not easily make good bread, it is largely used in cakes and puddings and for feeding cattle and poultry. The panicles are used for brooms, and the roots for velvet brushes.

FIG. 2.—*Sorghum vulgare*.

S. bicolor, *S. nigrum*, *S. rubrum*, *S. Kaffrorum* (Guinea Corn), *S. saccharatum*, and other species or varieties also of economic importance, the last named (the "Chinese sugar-cane") being much cultivated in the United States as a source of molasses, the juice, which contains much but comparatively little cane sugar, being simply evaporated and concentrated by evaporation. *S. vulgare* is the species referred to by Pliny as millet.

For systematic and economic purposes, see Grisebach, *Med.-Pharm. Botanik*, Leipzig, 1880; Drury, *Useful Plants of India*, London, 1873; F. v. Mueller, *Select Plants, for Naturalization in Victoria*, Melbourne, 1876. For carpology, see *Kulturpflanzen*, &c., Berlin, 1877. On *Sorghum* or "Guinea corn," &c., of western Kansas, see Drummond, "Report," *Patent Office Papers*, No. 2570 (1880).

MILLET, JEAN FRANÇOIS (1814–1875), was a of French peasant life, and it may be questioned whether France has produced in our day any greater original artist. He himself came of a peasant family, was born on the 4th of October 1814 in the hamlet of Gruchy, near Gréville (La Manche) in the picturesque district called Le Hameau. His boyhood passed working in his father's fields; but the sight of engravings in an old illustrated Bible set him drawing, thenceforth, while the other slept, the daily hour was spent by Millet in trying to render the familiar objects around him. From the village priest the lad learnt the Bible and Virgil in Latin, and acquired an interest in one or two other works of a high class which accompanied him to his home. He did not, however, attract attention so much by his attainments as by the stamp of his mind. The whole family seems, indeed, to have worn a cast of antique sanity and dignity, and when Millet's father decided to test the vocation of his son as an artist, it was with a gravity and authority which recall the patriarchal households of Calvinist France. Two drawings were prepared and placed before a painter at Cherbourg, Langlois de Monchel, who at once recognized the boy's gift, and accepted him as a pupil; but shortly after (1835) his father died, and the eldest son, with heroic devotion, took his place at home, nor did he return to his work in

g calls from without were solemnly enforced by the of his own family. He accordingly went back to burg, but after a short time spent there with another (Langlois) started with many misgivings for Paris. municil general of the department had granted him a f 600 francs, and the town council promised an pension of 100, but in spite of friendly help and ction Millet went through great difficulties. The of the Ecole [illegible] was hateful to him, [illegible] vocation that he decided [illegible] de Drouais. The master [illegible] good, he saw his ability, poverty could not longer put the [illegible] to the cabinet pour to the studies, [illegible] ake him take the approved direc- [illegible] Eh, bien, allez à votre guise, [illegible] et mon cher je ne veux rien vous [illegible] Millet when the competition for the Grand Prix [illegible] Delaroche gave Millet to understand that he [illegible] lose the nomination of another, and there- [illegible] Millet withdrew himself, and with his friend Marolle [illegible] a little studio in the Rue de l'Est. He had of the beaten track, but he continued to study [illegible] hilst he sought to procure bread by painting por- at 10 or 15 francs a piece and producing small [illegible] hes" of Watteau and Boucher. These works are [illegible] as those of his "flowery manner," and Millet has [illegible] preached he whose whole life was in fact of con- with having sacrificed his convictions to curry with the public. It is true that he himself has d his aversion to both these masters. "In the ," he said, "I received vivid impressions from ena, complete from Michelangelo, after Michelangelo assin I have remained faithful to the early masters. er was for him an object of "repulsion" and in "I saw," he said, "a little theatrical world which ed me." Thus it was then that Millet naturally I saw, but the strongest genius knows moments of ubt. Later in life Millet was heard to say that not for the small group who believed in him he have lost faith in himself. In earlier years, before certain of his own leadings, he was naturally influ- by the advice of others whose arguments were enforced pressure of dire poverty. Even so from time to he native vein showed strong. In 1840, as soon as de patched a portrait to the Salon, Millet went back ille, where he painted Sailor Mending a Sail and a ner pictures reminiscences of Cherbourg life. His ccess was obtained in 1841 when his Mill woman son in Riding (pastel) attracted notice at the Salon, ndly artists presented themselves at his lodgings- learn that his wife had just died, and that his broth- had appeared. Millet was at Cherbourg, there he ed, but having amassed a few hundred francs he t to Paris and presented his St Jerome at the t time. This picture was rejected and exists no for Millet, short of canvas, painted over it Oedipus nd, a work which during the following year was the of violent criticism. He was, however, no longer Diaz, Théodore Rousseau, and other men supported him by their confidence and friendship, had by his side the brave Catharine Lemaire, his wife, a woman who bore poverty with dignity and courage to bear her and through the cruel trials in he penetrated by a terrible personal experience the secrets of the very poor. To this date belong Golden Age, Bad News, Young Girl and Lamb, athers; but to the Bathers (Louvre) succeeded The r Asking Alms, The Workman's Monday, and The ower. This last work, exhibited in 1848, obtained conspicuous success, but did not sell till Ledru Rol informed of the painter's dire distress, gave him 500 fra for it, and accompanied the purchase with a commissi the money for which enabled Millet to leave Paris Barbizon, a village on the skirts of the forest of Fontai bleau. There he settled in a three-roomed cottage for rest of his life twenty-seven years, in which he wrou out the perfect story of that peasant life of which he al has given a "complete impression." Jules Breton coloured the days of toil with sentiment; others, Courbet, whose eccentric Funeral at Ornans attracted m notice at the Salon of 1850 than Millet's Sowers Binders, have treated similar subjects as a vehicle protest against social misery, Millet alone, a peasant a man table one himself, saw true, neither softening exaggerating what he saw. In a curious letter written M. Sensier at the date (1850) Millet expressed his reso to break once and for all with mythological and undra subject, and the names of the principal works pain subsequently will show how stedfastly this resolution kept. In 1852 he produced Girls Sewing, Man Spread Manure, 1853, The Reapers, 1854, Church at Grév (Luxembourg); 1855 the year of the Internatio Exhibition, at which he received a medal of second class Peasant Grafting a Tree, 1857, The Gleaners; 1859, T Angelus (Louvre, engraved Waltner), The Woodcutter Death; 1860 Sheep Shearing; 1861, Woman Shear Sheep, Woman Feeding Child; 1862, Potato Plant Winter and the Crows; 1863, Man with Hoe, Wom Carding; 1864, Shepherds and Flock, Peasants Bring Home a Calf Born in the Fields; 1869, Knitting Less 1870, Buttermaking; 1871, November- recollection Gruchy. Any one of these works will show how great influence Millet's previous practice in the nude had u his style. The dresses worn by his figures are not cloth but drapery through which the forms and movements of body are strongly felt, and their contour shows a gr breadth of line which strikes the eye at once. Someth of the imposing unity of his work was also, no doubt, to an extraordinary power of memory, which enab Millet to paint (like Horace Vernet) without a model; could recall with precision the smallest details of attitu or gestures which he proposed to represent. Thus he co count on presenting free from after thoughts the vi impressions which he had first received, and Millet's nat was such that the impressions which he received w always of a serious and often of a noble order, to wh the character of his execution responded so perfectly t even a Washerwoman at her Tub will show the gr action of a Medea. The drawing of this subject is rep duced in *Souvenirs de Barbizon*, a pamphlet in which Piedagnel has recorded a visit paid to Millet in 18 His circumstances were then less evil, after struggles severe as those endured in Paris. A contract by wh he bound himself in 1860 to give up all his work three years had placed him in possession of 1000 fra a month. His fame extended, and at the exhibition 1867 he received a medal of the first class, and ribbon of the Legion of Honour, but he was at the sa moment deeply shaken by the death of his faithful fri Pouchon. Though he rallied for a time he never c pletely recovered his health, and on the 20th Janu 1875 he died. He was buried by his friend's side in churchyard of Chailly.

Sensier, *Vie et Œuvre de J. F. Millet*, 1874; Piédag *Souvenirs de Barbizon*, &c. (E. F. S. P

MILLVILLE, a city of the United States, in Cumberl county, New Jersey, at the head of navigation of Mau river, 40 miles by rail from Philadelphia by the Cape M Millville, and Vineland section of the West Jersey Railro

is one of the chief seats of glass-making in the State, d also manufactures cotton, iron pipes for water and gas, rbines, &c. The population was 7660 in 1880.

MILMAN, Henry Hart (1791–1868), dean of St ul's, was born February 10, 1791, and was the third n of Sir Francis Milman, physician to George III. He s educated at Eton and at Brasenose College, Oxford; s university career was brilliant, and among other dis nctions he gained the Newdigate prize with a poem on e Apollo Belvedere. In 1816 he was ordained, and wa on afterwards presented to the living of St Mary's eading. He had already made his appearance as a amatic writer, his tragedy of *Fazio*, founded on a narra e in the *Annual Register* for 1795, having been brought the stage without his knowledge under the title of *The alian Wife*. It was subsequently produced at Covent rden, and obtained great succe s from the acting of iss O'Neill as Bianca. The merit of the play consists iefly in the powerful situation; the diction is florid and nate. The same criticism, by the author's own conte n, applies to his epic, *Samor, the Lord of the Fair ty* (Gloucester), a poem written in early youth. The bject is taken from British legend, and Milman has failed invest it with serious interest. He was more successful his next attempts, where the subject were well adapted an imagination easily kindled by the historical or the oral picturesque. The death struggle of an expiring tion in the *Fall of Jerusalem* (1820), the conflict of new ath and old order, of religious enthusiasm and earthly ection, in the *Martyr of Antioch* (1822), are depicted th great eloquence and real insight into human nature. lman's characters, however, are personified tendencies ther than personages, and in poetical style he was unable free himself from the influence of Byron. *Belshazzar* 822) is in general a pale copy of Byron's *Sardanapalus*, t contains some fine lyrics. Milman's lyrics, indeed, pecially his hymns, have frequently a fine ring and sweep, ough the thought is generally commonplace. His gedy of *Anne Boleyn* (1826) is a poor performance. ith the exception of admirable versions of the Sanskrit isode of Nala and Damayanti, and of the *Agamemnon* d *Bacchæ*, this was Milman's last poetical work.

s elected professor of poetry at Oxford, and in 1827 ivered the Bampton lectures, selecting as his subject the nduct and character of the apostles as an evidence of ristianity. In 1830 his *History of the Jews* appeared in e Family Library. The contracted limits of this series lbade any adequate treatment of the subject; the work nevertheless memorable as the first by an English rgyman which treated the Jews as an Oriental tribe, ognized sheikhs and emirs in the Old Testament, sifted d classified documentary evidence, and evaded or nimized the miraculous. Milman was violently attacked, pecially by Dr Faussett and Bishop Mant, and the odium is occasioned stopped the publication of the Family brary, and long impeded the preferment of the writer. 1835, however, Sir Robert Peel made him rector of St argaret's and canon of Westminster, and in 1849 he came dean of St Paul's. The unpopularity attaching to n had by this time nearly died away; and now, generally ered and beloved, intimate with men of all pursuits, litics, and persuasions, counted among the chief ornaments the most polished society of the metropolis, he occupied singularly dignified and enviable position, which he nstantly employed for the promotion of culture and ightenment, and in particular for the relaxation of bscription to ecclesiastical formularies. His *History of ristianity under the Empire* had appeared in 1840, but d been as completely ignored as if, said Lord Melbourne, clergy had taken a universal oath never to mention it to any one. Widely different was the reception continuation, his great *History of Latin Christi* the death of Pope Nicholas V., which appeared He also edited Gibbon and Horace, and at his 1868 left behind him almost finished a delightful of his own cathedral, which was completed and p by his son.

Milman possessed a large share of the imagination whi nto and calls up the past, and of that which interprets a pprehends opinions by the power of sympathy. In magination he was deficient, a defect which alone preve rom attaining the first rank as an historian. His crowded with splendid names rather than with vivid pe the pomp of action are dwelt with considerable penetra the actor himself is rather heard than seen. There are Exceptions, such as the portrait of Sir Christopher W he possessed a peculiar power of investing mere m ecedence with personality and life. His parallel of Teutonic Christianity, for example, a piece of finished character painting. His power of sympathy rendered him a his natural equal, and he may more than an int nded to his forensic polemic, only less readable perhaps with panthers. It will be long before even work superseded will perhaps be remembered even so as an elaborate the quiet to which the laborious scholar and patient appeared capable of encountering or to reward his amongst historical critics.

MILO, one of the most famous athletes of whose name became proverbial for personal s He lived about the end of the 6th century B.C., times crowned at the Olympic games and six time Pythian for wrestling, and was famous throughc civilized world for his feat of strength, such as an ox on his shoulders through the stadium at C In his native city of Crotona he was much honou he commanded the army which defeated the pe Sybaris in 511 B.C. When Democedes, the phys Darius, deserted the Persian service, he sent a message to the king of Persia informing him marriage to the daughter of Milo. The traditional of his death is often used to point a moral: he tree which some woodcutters had partially split wedge, and attempted to rend it asunder, but th fell out, and the tree closed on his hand, imprisoni till wolves came and devoured him.

MILO was the surname of T. Annius Papianus, the best known of the partisan leaders and ruffian stormy times that preceded the dissolution of the republic. His father was C. Papius Celsus, but adopted by his mother's father T. Annius Luscu joined the Pompeian party, and led the band of mer and gladiators which was required to defend the ca its chief supporter in the public streets. P. Clod leader of the ruffians who professed the democrati was his personal enemy, and their brawls in the stre their mutual accusations in the law courts lasted for years, beginning when Milo was tribune of the c in 57 B.C. In 53 their quarrels came to a heigh Milo was candidate for the consulship and Clodius praetorship, and when the two leaders met by acci the Appian Way at Bovillae, Clodius was murdered (. 20, 52 B.C.). This act of violence strengthened th of Pompey, who was nominated sole consul, and p several stringent laws to restore order in the city was impeached; his guilt was clear, and his enem every means of intimidating his supporters and his Cicero was afraid to deliver the speech he had p *Pro Milone*, and the extant oration is an expanded the unspoken defence. Milo went into exile at M and his property was sold by auction. He joi insurrection of M. Celius in 48 B.C., and was sc near Thurii in Lucania. His wife Fausta was d of the dictator Sulla.

MILTIADES. See Greece, vol. xi. p

M I L T O N

TON, John (1608–1674), was born in Bread Street, ide, London, on the 9th of December 1608. His known as Mr John Milton of Bread Street, scrivener, me of an interesting man. He was a native of shire, having been born there in or about 1563, the a Richard Milton, yeoman, of Stanton-St John's, re there are traces of one of the hardiest adherents old Roman Catholic religion that had been left in his- The son, however, had turned Protestant, and, been cast off on that account had come to London, tly about the year 1580 to push his fortune. ecorded a steadfast man, and having good abilities, ely in merchant business for some time by leadership and patronage. Not till 1599, at all events, he was free of the Company and at liberty to set up on his own account in the profession of a scrivener, till February 1599–1600, when he was about thirty ears of age did he enter the profession as a qualified of the Scrivener's Company. It was then that he s "house and shop" in Bread Street, and began, scriveners, his lawyerly business of drawing up marriage settlements, and the like, with such related s, that of receiving money from clients for invest- and lending it out to the best advantage. It was at me time that he married. Till recently there has e most extraordinary uncertainty as to the maiden of his wife, the mother of the poet. It has been ertained, however, that she was a Sarah Jeffrey, the two orphan daughters of a Paul Jeffrey, of St , London, "citizen and merchant taylor," originally , who had died before 1583. At the date of rriage she was about twenty-eight years of age. lowed mother, Mrs Ellen Jeffrey, came to reside in se in Bread Street, and died there in February 1. Before this death of the maternal grandmother, ildren had been born to the scrivener and his wife, only two survived, the future poet, and an elder alled Anne. Of three more children, born also , only one survived,—Christopher, the youngest of ly, born December 3, 1615.

first sixteen years of Milton's life, coinciding exactly last sixteen of the reign of James I, associate ve with the house in Bread Street, and with the dmg of that house in Old London. His father's permit in business, continued to be known as "mevenose" tastes, and even acquired some di in the London musical world of that time by his occasional contributions to important musical publications was thus a part of the poet's domestic education infancy. Whatever else could be added was without stint. Again and again Milton spoke with deep affection of the ungrudging pains bestowed his father on his early education, "both at the l and also under other masters at home, and ers in one language." He caused me to be The family removed to about the year 1619, Milton was in his tenth year of age. At that time his e tutor was Thomas Young, a Scotsman from Perth and graduate of the University of St Andrews, after a man of learning and distinction among the Puritan clergy. He then became pastor or assistant to some Englishmen in or near Hamburg, and kept out his hood by private teaching. Young's tutorship lasted 22, when he was driven abroad by an offer of the ship or chaplaincy to the congregation of English nts in Hamburg. Already, however, for a year or his tutorship had been only supplementary to the on which the boy was receiving his daily attendance Paul's public school, close to Bread Street. The ster of the school was Mr Alexander Gill, an elderly Oxford divine, of high reputation for scholarship teaching ability. Under him, as usher or second was his son, Alexander Gill the younger, also an graduate of scholarly reputation, but of blustering cha Milton's acquaintanceship with this younger Gill, be St Paul's school, led to subsequent friendship and spondence. Far more affectionate and intimate w friendship formed by Milton at St Paul's with a yonne Charles Diodati, his schoolfellow there, the s naturalized Italian physician, Dr Theodore Diodat had settled in London in good medical practice, an much respected both on his own account, and as bei brother of the famous Protestant divine, Jean or Gi Diodati of Geneva. Young Diodati, who was destin his father's profession, left the school for Oxford Uni early in 1623, but Milton remained till the end of A family incident of that year was the marriage elder sister Anne, with Edward Phillips, a clerk Government office called the Crown Office in Cha Milton had then all but completed his sixteenth ye was as scholarly, as accomplished, and as handso youth as St Paul's school had sent forth. We lear himself that his exercises "in English or other t prosing or versifying, but chiefly this latter," had be attract attention even in his boyhood. Thus impli he must have had a stock of attempts in English and by him of earlier date than 1624. Of these th specimens that now remain are his *Paraphrase on CXIV* and his *Paraphrase on Psalm CXXXVI*.

On February 12, 1624–25, Milton, at the age of years and two months, was entered as a student of C College, Cambridge, in the grade of a "Lesser Pens His matriculation entry in the books of the unive two months later, April 9, 1625. Between these tw James I had died, and had been succeeded by Cha

Cambridge University was then in the full flush prosperity on that old system of university ed which combined Latin and Greek studies with p drill and disputation in the scholastic logic and philo but with little of physical science, and next to no matics. There were sixteen colleges in all, dividing them a total of about 2900 members of the uni Christ's College, to which Milton belonged, ranked third in the university in respect of numbers, c about 260 members on its books. The master Thomas Bainbrigge; and among the thirteen fellow Mr Joseph Meade, still remembered as a comment the Apocalypse, and Mr William Chappell, afterw he is to hear. It was under Chappell's tutorshi Milton was placed when he first entered the colleg least three students who entered Christ's after Milt during his residence, deserve mention. One was Kme a youth of Irish birth and high Irish conn who entered in 1626, at the age of fourteen; anoth John Cleveland, afterwards known as royalist and who entered in 1627, and the third was Henry Mo subsequently famous as the Cambridge Platonist who in 1631, just before Milton left. Milton's own b Christopher joined him in the college in February 31, at the age of fifteen.

Milton's academic course lasted seven years a months, or from February 1624–25 to July 1632, h him from his seventeenth year to his twenty-fourth first four years were his time of undergraduatesh was in the second of these, the year 1626, tha occurred that quarrel between him and his tu Chappell, which Dr Johnson, making the most o tradition from Aubrey, magnified into the supposit Milton may have been one of the last students in e the English universities that suffered the indig

l punishment. The legend deserves no credit; but rtain that Milton, on account of some disagreement appell, leading to the interference of Dr Bainbrigge, lege for a time, and that, when he did return, it was an arrangement which, while securing that he should a term by his absence, transferred him from the ip of Chappell to that of Mr Nathaniel Tovey, of the fellows of Christ's. From a reference to tter in the first of the Latin elegies one infers that se of the quarrel was some outbreak of self-assertion on's part. We learn indeed, from words of his own re, that it was not only Chappell and Bainbrigge had offended by his independent demeanour, but r the first two or three years of his undergraduate e was generally unpopular, for the same reason, the younger men of his college. They had nick him "The Lady," a nickname which the students other colleges took up, converting it into "The Lady s's College"; and, though the allusion was chiefly peculiar grace of his personal appearance, it con also, a sneer at what the rougher men thought his- prudishness, the haughty seclusion in which he and morals. Quite as distinct as the information was for a while unpopular with the majority of his students are the proofs that they all came round him with respect and deference. The change had oc- curred before January 1628–29, when, at the age of , he took his B.A. degree. By that time he had pre-eminence in his college, and indeed among his in the whole university, had come to be acknow-

His reputation for scholarship and literary powers, dinary even then, was more than confirmed during maining three years and a half of his residence in idge. A fellowship in Christ's which fell vacant 0 would undoubtedly have been his had the election posts depended then absolutely on merit. As it e fellowship was conferred, by royal favour and e, on Edward King, his junior in college standing een months. In July 1632 Milton completed his at the university by taking his M.A. degree. His re in the University Register stands at the head of of those who graduated as masters that year from s. Anthony Wood's summary of the facts of his ity career as a whole is that he "performed the ate and academical exercises to the admiration of all, s esteemed to be a virtuous and sober person, yet be ignorant of his own parts." The statement is fect accordance with Milton's own account. He of "a certain niceness of nature, an honest haughti- nd self-esteem of what I was, or what I might be," of his earliest characteristics, and, though intimat- t, even while actually a student at Cambridge, he never greatly admired" the system of the place, he us in no doubt as to the quite exceptional applause hich he had gone through all the prescribed work. regular Latin and Greek of the university he had he tells us, French, Italian, and Hebrew. He had arnt fencing and other gentlemanly exercises of the nd was an expert swordsman.

Milton's skill at Cambridge in what Wood calls "the ate and academical exercises" specimens remain in *olusiones Quædam Oratoriæ*. They consist of seven cal Latin essays, generally in a whimsical vein, ed by him, in his undergraduateship or during his ent bachelorship in arts, either in the hall of 's College or in the public University School. of Milton's Cambridge period are also four of his *Familiar Epistles*; but more important are the l remains. These include the greater number of his ved Latin poems—to wit, (1) the seven pieces which compose his *Elegiarum Liber*, two of the most inte of them addressed to his medical friend, Charles I and one to his former tutor Young in his exile a burg, (2) the five short Gunpowder Plot epigram appended to the *Elegies*, and (3) the first five piece *Sylvarum Liber*, the most important of which are th meter poem "In Quintum Novembris" and the entitled "Naturam non pati senium." Of the poems of the Cambridge period the following is a list: *On the Death of a Fair Infant*, 1625–26, the being the death in that inclement winter of his niece, the first-born child of his sister Mrs Phill *a Vacation Exercise in the College*, 1628; the magn Christmas ode *On the Morning of Christ's Nativity*, the fragment called *The Passion* and the *Song o Marriage*, both probably belonging to 1630; the l *Shakespeare*, certainly belonging to that year; th fectious piece *On the University Carrier*, 1630–3 *Epitaph on the Marchioness of Winchester*, 1631 sonnet *To the Nightingale*, probably of the same ye sonnet *On arriving at the Age of twenty-three*, datin certainly in December 1631.

Just before Milton quitted Cambridge, his father, verging on his seventieth year, had practically from his Bread Street business, leaving the active m ment of it to a partner, named Thomas Bower, a apprentice of his, and had gone to spend his de years at Horton in Buckinghamshire, a small villa Colnbrook, and not far from Windsor. Here, accor in a house close to Horton church, Milton mainly for the next six years, from July 1632 to April 1

Although, when he had gone to Cambridge, it ha with the intention of becoming a clergyman, that in had been abandoned. His reasons were that "t had invaded the church," and that, finding he co honestly subscribe the oaths and obligations requ "thought it better to preserve a blameless silence the sacred office of speaking begun with servitu forswearing." In other words, he was disgusted w system of high prelacy which Laud, who had been of London and minister paramount in ecclesiastical since 1628, was establishing and maintaining in the of England. "Church-outed by the prelates," emphatically expresses it, he seems to have thought time of the law. From that too he recoiled; an ing the legal profession for his brother Christopher, decided that the only life possible for himself was leisurely independence, dedicated wholly to scholars literature. His compunctions on this subject, ex already in his sonnet on arriving at his twenty thi are expressed more at length in an English letter him, shortly after the date of that sonnet, and with of the sonnet included, to some friend who ha remonstrating with him on his "belatedness" a persistence in a life of mere dream and study. were gentle remonstrances also from his excellent Between such a father and such a son, however, t clusion was easy. What it was may be learnt from fine Latin poem *Ad Patrem*. There, in the midst enthusiastic recitation of all that his father had d him hitherto, it is intimated that the agreement b them on their one little matter of difference was complete, and that as the son was bent on a private literature and poetry, it had been decided that he have his own way, and should in fact, so long as he be the master of his father's means and the chief pe the Horton household. For the six years from 16 accordingly, was Milton's position. In perfect lei in a pleasant rural retirement, with Windsor at the of an easy walk, and London only about 17 miles

rough, he tells us, a systematic course of reading Greek and Latin classics, varied by mathematics, nd the kind of physical science we should now call aphy.

an interesting fact that Milton's very first public ce in the world of English authorship was in so le a place as the folio edition of *Shakespeare* His enthusiastic lines on Shakespeare, written was one of the seventeen pieces prefixed to ond folio, above whose of the commendatory hat had appeared in the first folio, one of them on moment to Shakespeare's memory, the poem as now written by Milton at Horton, in all probability after the Latin hexameter *Ad* were to become companion pieces. *L'Allegro* followed, in or about 1633, the *Penseroso*. It was part of a pastoral masque by the young people of the noble family of Egerton at the venerable relative the countess dowager , and performed before that lady at her mansion of l, near Uxbridge, about 10 miles from Horton. lton contributed the words for the entertainment at certain, owing to his friendship with Henry e of the chief court magnates of that time whose nnexion with the Egerton family procured him or obable management of the Horton performance. Next ans to the connection of Horton may be d the three short pieces, *On Shakespeare, May*, *On* nd *Upon the Circumcision*; after which comes the largest and most important of all Milton's es. The name by which that beautiful drama niversally known was not given to it by Milton He entitled it, more simply and vaguely, "A pre ented at Ludlow Castle, 1634 before the Earl water, Lord President of Wales." The existence mask is certainly due to Milton's intimacy with The earl of Bridgewater, the head of the Egerton had been appointed to the high office of the y or viceroyalty of Wales, the official seat of s Ludlow in Shropshire; it had been determined er the festivities on his assumption of the office ould be a great masque in the hall of Ludlow ph Lawes for the stage manager and one of the Milton had been applied to by Lawes for the and, actually, on Michaelmas night, September 29

testimony to her character is that she was a "a most excellent mother and particularly known for her charities through the neighbourhood." The year 1637 was otherwise eventful in his biography. It was in that year that his *Comus*, after lying in manuscript for more than two years, was published by itself, in the form of a small quarto of thirty five pages. The author's name was withheld, and the entire responsibility of the publication was assumed by Henry Lawes. Milton seems to have been in London when the little volume appeared. He was a good deal in London, at all events, during the summer and autumn months immediately following his mother's death. The plague, which had been on one of its periodical visits of ravage through England since early in the preceding year, was then especially severe in the Horton neighbourhood, while London was comparatively free. It was probably in London that Milton heard of the death of young Edward King of Christ College, whom he had left as one of the most popular of the fellows of the college, and one of the clerical hopes of the university. King had sailed from Chester for a vacation visit to his relatives in Ireland, when, on the 10th of August, the ship, in perfectly calm water, struck on a rock and went down, he and nearly all the other passengers going down with her. There is no mention of the sad accident in two otherwise very interesting Latin *Familiar Epistles* of Milton; of September 1637, both addressed to his medical friend Charles Diodati, and both dated from London; but how deeply the death of King had affected him appears from his occupation shortly afterwards. In November 1637, and probably at Horton, whence the plague had by that time vanished, he wrote his matchless pastoral monody of *Lycidas*. It was his contribution to a collection of obituary verses, Greek, Latin, and English, which King's numerous friends, at Cambridge and elsewhere, were getting up in lamentation for his sad fate. The collection did not appear till early in 1638, when it was published in two parts, with black-bordered title-pages, from the Cambridge University press, one consisting of twenty three Latin and Greek pieces, the other of thirteen English pieces, the last of which was Milton's monody, signed only with the initial "J. M." It was therefore early in 1638, when Milton was in his thirtieth year, that copies of his *Lycidas* may have been in circulation among those who had already become acquainted with his *Comus*.

Milton was then on the wing for a foreign tour. He had long set his heart on a visit to Italy, and circumstances now favoured his wish. The vexatious Cotton law suit after hanging on for nearly two years, was at an end, as far as the elder Milton was concerned, with the most absolute and honourable vindication of his character for probity, though with some continuation of the case against the late partner, Bower. Moreover, Milton's younger brother, Christopher, though but twenty-two years of age, and even about to be called to the bar of the Inner Temple, had married a wife, and the young couple had gone to reside at Horton to keep the old man company. There became nothing then to detain Milton, all was arranged for his journey. Before the end of April 1638 he was on his way across the Channel, taking one English servant with him. At the time of his departure the latest news in England was that of the National Scottish Covenant, or solemn oath and band of all ranks and classes of the Scottish people to stand by each other to the death in resisting the ecclesiastical innovations which Laud and Charles had been forcing upon Scotland. To Charles the news of this "damnable Covenant," as he called it, was enraging beyond measure; but to the mass of the English Puritans it was far from unwelcome, promising, as it seemed to do, for England herself, the subversion at last of that system of "Thorough," or despotic

government by the king and his ministers without parliaments, under which the country had been groaning since the contemptuous dissolution of Charles's third parliament ten years before.

Through Paris, where Milton made but a short stay, receiving polite attention from the English ambassador, Lord Scudamore, and having the honour of an introduction to the famous Hugo Grotius, then ambassador for Sweden at the French court, he moved on rapidly to Italy, by way of Nice. After visiting Genoa, Leghorn, and Pisa, he arrived at Florence, August 1638. Enchanted by the city and its society, he remained there two months, frequenting the chief academies or literary clubs, and even taking part in their proceedings. Among the Florentines with whom he became intimate were Jacopo Gaddi, young Carlo Dati, Pietro Frescobaldi, Agostino Coltellini, the accountant Benedetto Buommattei, Valerio Chimentelli, and Antonio Francini. It was in the neighbourhood of Florence also that he "found and visited" the great Galileo, then old and blind, and still nominally a prisoner to the Inquisition for his astronomical heresy. From Florence, by Siena, Milton went to Rome. He reached the Eternal City one time in October, and spent about another two months there, not only going about among the ruins and antiquities and visiting the galleries, but mixing at once in the best society in Florence, with the learned society of the ecclesiastical city. Among those with whom he formed acquaintance at Rome were the German scholar, Lucas Holstenius, librarian of the Vatican, and three native Italian scholars named Cherubini, Salzilli, and Selvaggi. There is record of his having dined once, in company with several other Englishmen, at the hospitable table of the English Jesuit College. The most picturesque incident, however, of his stay in Rome was his presence at a great musical entertainment in the palace of Cardinal Francesco Barberini. Here he had not only the honour of a specially kind reception by the cardinal himself, but also the supreme pleasure of listening to the marvellous Leonora Baroni, the most renowned singer of her age. Late in November he left Rome for Naples. Here he was fortunate. The great man of the place was the now very aged Giovanni Battista Manso, marquis of Villa, the friend and biographer of the great Tasso, and subsequently the friend and patron of the sweet Marino. By a happy accident Milton obtained an introduction to Manso, and nothing could exceed the courtesy of the attentions paid by the aged marquis to the young English stranger. He had hardly been in Naples a month, however, when there came news from England which not only stopped an intention he had formed of extending his tour to Sicily and thence into Greece, but urged his immediate return home. "The sad news of civil war in England," he says, "called me back; for I considered it base that, while my fellow-countrymen were fighting at home for liberty, I should be travelling abroad for intellectual culture." In December 1638, therefore, he set his face northwards again. His return journey, however, probably because he learnt that the news he had first received was exaggerated or premature, was broken into stages. He spent a second two months in Rome, ascertained to have been January and February 1638–39; during which two months, as he tells us, he was in some danger from the papal police, because the English Jesuits in Rome had taken offence at his habit of free speech, wherever he went, on the subject of religion. Though he did not alter his demeanour in the least in this particular, nothing happened: and from Rome he got safely to Florence, welcomed back heartily by his Florentine friends, and renewing his meetings with them privately and in their academies. His second visit to Florence, including an excursion to Lucca, extended over two months; and not till April 1639 did he take leave, and proceed, by Bologna and Ferrara, to Venice. About a month was given to Venice; and thence he shipped for England the books he had collected in Italy, he went on, by Verona and Milan, over the Alps to Geneva. In this Protestant city he spent a week in June, forming interesting acquaintanceships there and having daily conversations with the great Protestant theologian Dr Jean Diodati, the uncle of his friend Charles Diodati. From Geneva he returned to France, so to England. He was home again in August 1639, having been absent in all fifteen or sixteen months.

Milton's Continental tour and especially the Italian portion of it, remained one of the chief pleasures of his memory throughout all his subsequent life. Nor was it without fruits of a literary kind. Besides two of his Latin elegies, *Epistola Familiaris*, one to the Florentine gentleman Buommattei, and the other to Lucas Holstenius, which have to be assigned to Milton's sixteen months' sojourn on the Continent, his three Latin epigrams, *Ad Leonoram Romæ Canentem*, his Latin verses *Ad Salsillum Romanum Lacrymæ*, his fine and valuable piece of Latin hexameters entitled *Mansus*, and his *Ten Sonnets, with a Canzone*, celebrating the charms of an Italian lady he had met in his travels.

One sad and nearer memory did mingle itself with all that was otherwise so delightful in his Italian reminiscences. His bosom friend and companion from boyhood, more than Charles Diodati had been to him a Jonathan to David, and into whose ear he had hoped to pour the whole narrative of what he had seen and done abroad, had died during his absence. He had died, in Pall Mall, London, in August 1638, not four months after Milton had gone away on his tour. The intelligence of it reached Milton till some months afterwards, probably till his second stay in Florence, and, though he may have learnt some of the particulars from others in Geneva, he did not know them fully till his return to England. How profoundly they affected him appears from his *Epitaphium Damonis*, then written in memory of his dead friend. The importance of this poem in Milton's biography cannot be overrated. It is perhaps the finest of all his Latin poems; and, though in the form pastoral, and not a pastoral of the most artificial type, it is unmistakably an outburst of the most passionate personal grief. In this respect *Lycidas*, artificial as it also is, though that poem is, cannot be compared with it, the only fact that *Lycidas* is in English while the *Epitaphium Damonis* is in Latin that has led to the notion that Edward King of Christ's College was personally and profoundly the friend of Milton's youth, not of early manhood.

That Milton, even while in Italy, had been intermittently at work on the achievement in poetry which he had yet attempted only in part, we have known since 1823. What we should not have known for certain but for the incidental proof given by the *Epitaphium Damonis* is that, from the time of his return from Italy, he had resolved on some such literary effort of a new sort. This poem is one in which, after returning to the hope of literary and political careers as suddenly ended by his death, Milton speaks of himself as the story of his own projects in his profession of literature, if may run thus:—

> I have a theme of the Tropic, crossing our course in the Shipmen to sing, and the realm of Imogen along to the Brennus and Arviragus, dukes, and Brennus' lofty harbour Then the Armoric settlers under the law of the Britain Ay, and the womb of Iggrane fatally pregnant with Arthur Uther's son, whom he got disguised in Gorlois' likeness All by Merlin's craft. Church on something like the Scottish Presbyterian
Since the opening of the parliament there had been a
of pamphlets crossing one another in the air from
three parties. The chief manifesto of the high
party was a pamphlet by Joseph Hall, bishop of
entitled *Humble Remonstrance to the High Co
Parliament*. In answer to Hall, and in represent
the views of the root-and-branch party, there had
forth, in March 1640–41, five leading Puritan
ministers, the initials of whose names, clubbed toge
the title-page of their joint production, made the
word "Smectymnuus." These were Stephen M
Edmund Calamy, Thomas Young, Matthew New
and William Spurstow. The Thomas Young whos

es in the middle was no other than the Scottish
nas Young who had been Milton's domestic preceptor
Bread Street. Having returned from Hamburg in
, he had been appointed to the vicarage of Stowmarket
ffolk, in which living he had remained ever since,
the reputation of being one of the most solid and
ed Puritans among the English parish clergy. The
us Smectymnuan pamphlet in reply to Hall was
ly Young's. What is more interesting is that his old
Milton was secretly in partnership with him and hi
er Smectymnuans. Milton's hand is discernible in a
on of the original Smectymnuan pamphlet, and he
nued to aid the Smectymnuans in their subsequent
nders to Hall's defences of himself. It was more in
on's way, however, to appear in print independently
in May 1641, while the controversy between Hall and
Smectymnuans was going on, he put forth a pamphlet
is own. It was entitled *Of Reformation touching
ch Discipline in England and the Causes that hav
rto hindered it*, and consisted of a review of English
siastical history, with an appeal to his countrymen to
me that course of reformation which he considered to
been prematurely stopped in the preceding century,
to sweep away the last relics of papacy and prelacy
ng all the root and branch pamphlets of the time a
t out, and stands out still, as the most thoroughgoing
tremendous. It was followed by four others in rapid
ession, to wit, *Of Prelatical Episcopacy and whether
ay be deduced from the Apostolical Times* (June 1641),
*nadversions upon the Remonstrant's Defence against
tymnuus* (July 1641), *The Reason of Church Gover
urged against Prelaty* (February 1641–2), *Apology
nst a Pamphlet called a Modest Confutation of the
nadversions*, &c. (March 1641–2). The first of these
directed chiefly against that middle party which
ated a limited Episcopacy, with especial reply to the
ments of Archbishop Ussher, as the chief exponent of
iews of that party. Two of the others, as the titles
y belong to the Smectymnuan series, and were
gations of Bishop Hall. The greatest of the four, and
most important of all Milton's anti-Episcopal pamphlets
the first, i.e. that entitled *The Reason of Church
rnment*. It is there that Milton takes his readers
his confidence, speaking at length of himself and his
ves in becoming a controversialist. Poetry, he declares,
his real vocation; it was with reluctance that he had
lved to "leave a calm and pleasing solitariness, fed with
rful and confident thoughts, to embark in a troubled
of noises and hoarse disputes"; but duty had left him
option. The great poem or poems he had been meditat
could wait, and meanwhile, though in prose polemics
ad the use only of his "left hand" that hand should
sed with all its might in the cause of his country and
berty.

he parliament had advanced in the root-and-branch
ction so far as to have passed a bill for the exclusion
ishops from the House of Lords, and compelled the
g's assent to that bill, when, in August 1642, the
lder struggle between Charles and his subjects took the
of civil war. All England was then divided into the
alists, supporting the king, and the Parliamentarians,
ering to that majority of the Commons, with a
ority of the Lords, which sat on as the parliament.
ile the first battles of the civil war were being fought
varying success, this parliament, less impeded than
n it had been full, moved on more and more rapidly
he root-and-branch direction, till, by midsummer 1643,
abolition of Episcopacy had been decreed, and the
stion of the future non-prelatic constitution of the
rch of England referred to a synod of divines, to meet
at Westminster under parliamentary authority. Of M
life through those first months of the civil war l
known. He remained in his house in Aldersgate
teaching his nephews and other pupils; and the
scrap that came from his pen was the semi-jocose
bearing the title *When the Assault was intended to th*
In the summer of 1643, however, there was a great
in the Aldersgate Street household. About the end o
as his nephew Edward Phillips remembered, Milto
away on a country journey, without saying whither
what purpose, and, when he returned, about a
afterwards, it was with a young wife, and with
her sisters and other relative in her company. H
in fact been in the very headquarters of the King a
Royalist army in and round Oxford, and the la
brought back with him was a Mary Powell, the
daughter of Richard Powell, Esq., of Forest Hil
Oxford. She was the third of a family of eleven so
daughters, of good standing but in rather embar
rcumstances, and was seventeen years and four
old while Milton was in his thirty-fifth year. He
the marriage came about, it was a most unfortunate
The Powell family were strongly Royalist, and th
herself seems to have been frivolous, not unlikely
stupid. Hardly were the honeymoon festivities
Aldersgate Street when her sisters and other re
having returned to Forest Hill and left her alone w
husband, she pined for home again and begged
allowed to go back on a visit. Milton consented,
understanding that the visit was to be a brief one
seems to have been in July 1643. Soon, howev
intimation from Forest Hill was that he need ne
ever to have his wife in his house again. The re
seems to have been mainly the girl's own aborted
mother, but, as the king's cause was then prospe
the field, it is a fair conjecture that the whole
Powell family had repented of their adherence
so prominent a Parliamentarian and a subject of the
of England as Milton. While his wife was away,
father, who had been residing for three years w
younger and lawyer son at Reading, came to take
quarters in Aldersgate Street.

Milton's conduct under the insult of his wife's de
was most characteristic. Always frank and pro
he converted his own case into a public protest against
existing law and theory of marriage. *The Doctr
Discipline of Divorce. Restored to the good of both Se*

relation to be a clerically invented superstition, and a
that inherent incompatibility of character, or con
of mind, between two married persons, is a perfec
reason for divorce. There was no reference to h
case, except by implication; but the boldness
speculation roused attention and sent a shock t
London. It was a time when the authors of her
this sort, or of any sort, ran considerable risk
famous Westminster Assembly of Divines, called
Long Parliament, had met on the appointed day,
1643; the Scots, in consenting to send an arm
England to assist the parliament in their war w
King, had proposed, as one of the conditions, their
League and Covenant, binding the two nations to en
after a uniformity of religion and of ecclesiastical di
with the extirpation of all "heresy, schism, and
ness," as well as popery and prelacy; the Solemn Lea
Covenant had been enthusiastically accepted in E
and was being sworn to universally by the Parliamen
and one immediate effect was that four eminent

and two Scottish lay commissioners were added to stminster Assembly and became leaders there. r Milton's divorce tract was formally discussed in embly during the first month of its sitting is n; but it is certain that the London clergy, g not a few members of the Assembly, were then about it privately with anger and execration. it might be moved [illegible] to a more public prosecu lton threw off the anonymous in a second and larged edition of the tract, in February 1643 44, d openly to the Parliament and the Assembly a month or [illegible] during which the gossip about his monstrous doctrine was spreading more and turned his attention to other subjects. Among tion made in the general ferment of opinion about to the civil war was that of a reform of onal system of education and especially of the [illegible] To this question Milton made a contribution 1644 in a small *Tract on Education*, in the form to Mr Samuel Hartlib, a German then resident n and interesting himself busily in all philanthropic and schemes of social reform. In the very next however, July 1644, he returned to the divorce in a pamphlet addressed specially to the clergy tled *The Judgment of Martin Bucer concerning* The outcry against him then reached its height. attacked in pamphlets, he was denounced in ll through London, and more than once in sermons e two Houses of Parliament by prominent divines estminster Assembly; strenuous efforts were made him within definite parliamentary censure. In formed against him for this purpose a leading played, at the instigation of the clergy, by the s Company of London. That company represent publishers and booksellers of London, had a plea own against him, on the ground that his doctrine only immoral, but had been put forth in an illegal His first divorce treatise, though published imme after the "Printing Ordinance" of the parliament 14, 1643, requiring all publications to be licensed by one of the official censors, and to be registered ooks of the Stationers' Company, had been issued licence and without registration. Complaint to t was made against Milton, with some others liable nis charge of contempt of the printing ordinance, tion of the Stationers to the House of Commons 1644; and the matter came before committees that House and in the Lords. It is to this ance that the world owes the most popular and , if not the greatest, of all Milton's prose writings, *Areopagitica, a Speech of Mr John Milton for the Liberty of Unlicensed Printing to the Parliament* It appeared in the end of November 1644, h authorised and unlicensed, as was proper ut of question, and was a remonstrance addressed ectly to Parliament, as an oration to them free st their ordinance of June 1643 and the y system of licensing and censorship of the press. ugh the Parliament in other respects, it ed their printing ordinance as utterly unworthy of nd of the new era of English liberties which they itiating, and it led not to its repeal. Though that d not follow the pamphlet virtually accomplished ose. The licensing system had received its death nd, though the Stationers returned to the charge ler complaint to the House of Lords, Milton's against the printing ordinance was condoned. He was ded in pamphlets, and found himself "in a world of n"; but he lived on through the winter of 1644–45 bed in his house in Aldersgate Street. To this period there belong, in the shape of verse, only his sonnets ix. and x., the first to some anonymous lady, and the second "to the Lady Margaret Ley," with perhaps the Greek lines entitled *Philosophus ad Regem Quendam*. His divorce speculation, however, still occupied him; and in March 1644 45 he published simultaneously his *Tetrachordon, or Expositions upon the four chief places of Scripture which treat of Marriage*, and his *Colasterion, a Reply to a nameless Answer against the Doctrine and Discipline of Divorce*. In these he replied to his chief recent assailant, lay and clerical, with merciless severity.

It was not merely Milton's intellectual eminence that had saved him from prosecution for his divorce heresy. A new tendency of national opinion on the church question had operated in his favour, and in favour of all forms of free speculation. There had occurred in the Westminster Assembly itself, and more largely throughout the general community that split of English Puritanism into the two opposed varieties of Presbyterianism on the one hand and Independency or Congregationalism on the other which explains the whole subsequent history of the Puritan revolution. Out of this theoretical discussion as to the constitution of the church there had grown the all-important practical question of toleration. The Presbyterians insisted that the whole population of England should necessarily belong to the one national Presbyterian Church, be compelled to attend its worship, and be subject to its discipline, while the Independents demanded that, if a Presbyterian Church should be set up as the national and state paid church, there should at least be liberty of dissent from it, and toleration for those that chose to form themselves into separate congregations. Vehement within the Westminster Assembly itself, the controversy had attained wider dimensions out of doors, and had inwrought itself in a most remarkable manner with the conduct of the war. Orthodox Presbyterian Calvinists were still the majority of the Puritan body, but, in the new atmosphere of liberty, there had sprung up, from secret and long-suppressed seeds in the English mind, a wonderful variety of sects and denominations, mingling other elements with their Calvinism, or hardly Calvinistic at all,—most of them, it is true, fervidly Biblical and Christian after their different sorts, but not a few professing the most coolly inquisitive and sceptical spirit, and pushing their speculations to strange extremes of free-thinking. These sects, growing more and more numerous in the large towns, had become especially powerful in the English Parliamentary army. That army had, in fact, become a marching academy of advanced opinionists and theological debaters. Now, as all the new Puritan sects, differing however much among themselves, saw their existence and the perpetuity of their tenets threatened by that system of ecclesiastical uniformity which the Presbyterians proposed to establish, they had, one and all, abjured Presbyterianism, and adopted the opposite principle of Independency, with its appended principle of toleration. Hence an extraordinary conflict of policy among those who seemed to be all Parliamentarians, all united in fighting against the king. The auxiliary Scottish army, which had come into England in January 1643 44, and had helped the English generals to beat the King in the great battle of Marston Moor in July 1644, thought that he had then been almost sufficiently beaten, and that the object of the Solemn League and Covenant would be best attained by bringing him to such terms as should secure an immediate Presbyterian settlement and the suppression of the Independents and sectaries. In this the chief English commanders, such as Essex and Manchester, agreed substantially with the Scots. Cromwell, on the other hand, who was now the recognized head of the army Independents, did not think that the king had

sufficiently beaten, even for the general purposes of war, and was resolved that the war should be pushed a point at which a Presbyterian settlement should be ssible without guarantees for liberty of conscience and eration of non-Presbyterian sects. Through the latter of 1644, accordingly, Milton had been saved from the ties which his Presbyterian opponents would have ted on him by this general championship of liberty of on by Cromwell and the army Independents. Before middle of 1645 he, with others who were on the books of the Presbyterians as heretic , wa safer Though the parliament had voted, in January –45, that the future national church of England should the Presbyterian system, Cromwell and the Inde ents had taken care to have the question of tolera left open; and, within the next month or two, by nwell's exertions, a completely new face wa put upon war by the removal of all the chief officers that had in command hitherto, and the equipment of the Model army, with Fairfax a its commander-in-chief Cromwell himself as lieutenant-general. The Scots

he stricter English Presbyterians looked on matrimonially this army took the field, calling it an "Army of aries,' and almost hoping it would be beaten. On 14, 1645, however, there was fought the great battle aseby, utterly ruining the king at last, and leaving relics of his forces here and there. Milton position may be easily understood. Though his first tendency the church question had been to some form of a byterian constitution for the church, he had parted rly now from the Scots and Presbyterians, and became rtisan of Independency, having no dread of "sects and ms," but regarding them rather as healthy ferments in English body politic. He was, indeed himself one of most noted sectaries of the time, for in the list of drawn out by contemporary Presbyterian writers al mention is made of one small sect who were known *Miltonists* or *Dreamers*.

So far as Milton was concerned personally, his interest the divorce speculation came to an end in July or ast 1645, when, by friendly interference, a reconcilia was effected between him and his wife. The ruin of king's cause at Naseby had suggested to the Powells it might be as well for their daughter to go back to her and after their two years of separation. It was not, ever, in the house in Aldersgate Street that she rejoined but in a larger house, which he had taken in the cent street called Barbican, for the accommodation of ncreasing number of pupils.

he house in Barbican was tenanted by Milton from t August 1645 to September or October 1647. Among irst occupations there must have been the revision of proof sheets of the first edition of his collected poems, ppeared as a tiny volume, copies of which are now very with the title *Poems of Mr John Milton, both English Latin, composed at several times*. The title-page gives date 1645, but January 1645–46 seems to have been exact month of the publication. The appearance of volume indicates that Milton may have been a little by this time of his notoriety as a prose-polemic, and ous of being recognized once more in his original acter of literary man and poet. But, whether because edagogic duties now engrossed him or for other reasons, few new pieces were added in the Barbican to those the little volume had thus made public. In English, e were only the four sonnets now numbered xi. xiv., the two entitled "On the Detraction which followed upon writing certain Treatises," the third "To Mr Henry es on his Airs," and the fourth "To the Religious ory of Mrs Catherine Thomson," together with the

powerful anti-Presbyterian invective or "tailed s entitled "On the New Forcers of Conscience und Long Parliament"; and in Latin there were only t *Ad Joannem Rousium*, the title called *Apolog Rustico et Hero*, and one interesting *Familiar* addressed to his Florentine friend Carlo Dati family incidents of importance, however, appertain time of residence in Barbican. Oxford having surre to Fairfax in June 1646, the whole of the Powell had to seek refuge in London, and most of them shelter in Milton's house. His first child, a d named Anne, was born there on the 29th of Jul year, on the 1st of January 1646–47 his father m Powell died there, leaving his affairs in confusion, the following March his own father died there, at of eighty-four, and was buried in the adjacent churc Gile, Cripplegate. For the rest, the two years in B are nearly blank in Milton's biography. The Revolution was still running its course. For Charles's surrender of himself, in May 1646, to the a Scottish army rather than to Fairfax and Cromwe his residence with that Scottish army at Newc negotiation with the Scots, had given the Pre by the advantage, but after the Scots had evacuated I in January 1646–47, leaving Charles a captive w English subjects, and especially after the Engli h ar seized him at Holmby in June 1647 and undertak further management of the treaty with him, the ad was all the other way. It was a satisfaction to and perhaps still a protection for him, that the "I Independents and Sectaries" had come to be rea masters of England.

From Barbican Milton removed, in Septem October 1647, to a smaller house in that part o Holborn which adjoins Lincoln's Inn Fields. His relatives had now left him, and he had reduc number of his pupils, or perhaps kept only h nephews. But, though thus more at leisure, he yet resume his projected poem, but occupied rather with three works of scholarly labour which already for some time had on hand. One was th pilation in English of a complete history of Engl rather of Great Britain, from the earliest times; was the preparation in Latin of a complete s divinity, drawn directly from the Bible; and the th the collection of materials for a new Latin dic Milton had always a fondness for such labour of ship and compilation. Of a poetical kind there t to record, during his residence in High Holborn, experiment in psalm-translation, in the shape of lxxx.–lxxxviii. done into environ metre in April 16 the *Sonnet to Vane*, written in September of th year. This last connects him again with the c public affairs. The king, having escaped from the of the army chiefs, and taken refuge in the Isle of had been committed to closer custody there, all treaty between him and parliament had been declare end, and the result would probably have been his tion, but for the consequences of a secret treaty contrived to make with the Scots. By this tre Scots engaged to invade England in the king's re-ene him from the English parliament and re restore him to his full royalty, while he engaged to ratify the Covenant, the Presbyterian system of government, and all the other conclusions of the mus-ter Assembly, throughout England, and down Independency and the sects. That, in May began what is called the Second Civil War, consist of new risings of the Royalists in various parts of E and then of a conjunction of these with a great

and by a Royalist Scottish army, under the command duke of Hamilton. It was all over in August when the crushing defeat of the Scottish army by ell in the three days' battle of Preston, and the mpt suppression of the Lancash Royalist insur in the south-east counties by Fairfax's siege and of Colchester, left Charles at the mercy of the Milton's *Sonnet to Fairfax* was a congratulation general in chief of the parliamentary forces at ter and attested the exultation of the writer over mph of the Presbyterian cause. His exultation ed through what followed. After one more dying t the parliament in negotiation with Charles, the ed the whole future on itself. The long wa t from the Isle of Wight the parliament, manipu y the army officers, and purged of all members impede the army's purposes, was converted into ssion for that purpose. A court of high justice t up for the trial of Charles, and on January 49 he was brought to the scaffold in front of all. By that act England became a republic, d without King or House of Lords, by the persever bers of "Rump" of the recent House of Commons, ne men with an executive council of forty, composed one member appointed annually by that House. fact Parliament of mark out of parliament to himself openly to the new republic was John . He befriended by the publication of his pamphlet *Power of Kings and Magistrates*, a work that it is and that it becomes all men to abhor, for any whatever to call to account a tyrant or wicked King, and, n conclusion to depose and put him to death, if they y think fit, but the like no where else. It was out a fortnight after the king's death, and as Milton's ormance in the house in High Holborn. The chief new republic could not but perceive the importance nce the service of a man who had so powerfully pen in support of their proceedings, and who was otherwise so distinguished. In March 9, accordingly, Milton was elected and accepted the y-ship for foreign tongues to the council of the new Commonwealth. The salary was to be £288 a orth about 1000 a year now. To be near his new ce, the house on the council, which held its daily for the first few weeks in Derby House, close to all, but afterwards regularly in Whitehall itself, he at once to temporary lodgings at Charing Cross

ry for the meeting of council which Milton attended. have made personal acquaintance with the chief Fairfax, Cromwell himself, Sir Henry Vane Henry Marten, Heselrige, Sir Gilbert Pickering, other chiefs of the council and the Commonwealth he had not known some of them before. After a ble, for his greater convenience, official apartments ceeding on Whitehall itself.

e date of Milton's appointment to the secretaryship s less vague than that of his special duty was the e of such letters as were sent by the council of ous countries to the Rump Parliament, to foreign and private with the examination and translation ers in reply, and with personal conferences, when ary, with the envoys of foreign powers in London. ith envoys and such others. As Latin was the ge employed in the written diplomatic documents, came to be known indifferently as the secretaryship eign tongues or the Latin secretaryship. In that owever, his duties, more particularly at first, were ght in comparison with those of his official colleague, lter Frost, the general secretary. Foreign powers of from the English republic as much as they could;

and, while Mr Frost had to be present in every meet the council, keeping the minutes, and conducting a general correspondence, Milton's presence was re only when some piece of foreign business did tu Hence, from the first, his employment in very m laneous work. Especially, the council looked to hi everything in the nature of literary vigilance and li help in the interests of the struggling Commonwealth was employed in the examination of suspected paper in interview with their authors and printers; a executed several great literary commissions exp entrusted to him by the council. The first of the his pamphlet entitled *Observations on Ormond's Arti Peace with the Irish Rebels*. It was published in 1649, and was in defence of the republic agai complication of Royalist intrigues and dangers in Ir A passage of remarkable interest in it is one of el eulogy on Cromwell. More important still wa *Eikonoklastes* (which may be translated "Image Smas published by Milton in October 1649, by w counterblast to the famous *Eikon Basilike* ("T Image"), which had been in circulation in thousa copies since the king's death, and had become a k Bible in all Royalist households, on the supposition had been written by the royal martyr himself. A piece of work was of a more laborious nature. I end of 1649 there appeared abroad, under the ti *Defensio Regia pro Carolo I*, a Latin vindication memory of Charles, with an attack on the English monwealth, intended for circulation on the Continent it had been written, at the instance of the exiled family, by Salmasius, or Claude de Saumaise, of L then of enormous celebrity over Europe as the gr scholar of his age. It was regarded as a serious blow infant Commonwealth. To answer it was thought worthy of Milton, and he threw his whole strength in performance through the year 1650, interrupting h only by a new and enlarged edition of his *Eikono* Not till April 1651 did the result appear; but then th ce was prodigious. Milton's Latin *Pro Populo Ang Defensio*, as it was called, ran at once over the l Land and the Continent, rousing acclamation every and received by scholars as an annihilation of the Salmasius. Through the rest of 1651 the observati that the two agencies which had co-operated most in raising the reputation of the Commonwealth a were Milton's book and Cromwell's battles. These of Cromwell in the service of the Commonwealth h tended, had kept him absent from the council of of which he was still a member, since shortly aft beginning of Milton's secretaryship. For nearly a y had been in Ireland, as lord lieutenant, reconquerin country after its long rebellion; and then, for a year, he had been in Scotland, crushing the R commotion there round Charles II., and annexing Sc to the English republic. The annexation was compl the end of September 1651, when Cromwell, c Charles II and his army out of Scotland, came up them at Worcester and gained his crowning victory. Commonwealth then consisted of England, Ireland Scotland, and Cromwell was its supreme chief.—Th the eventful year 1651, it has been recently ascert Milton had added to the other duties of his secreta that of Government journalist. Through the whole year, if not from an earlier period, he acted as licens superintending editor of the *Mercurius Politicus*, a paper issued twice a week, of which Mr March Needham was the working editor and proprietor. M hand is discernible in some of the leading articles.

About the end of 1651 Milton left his official ro

all for a house he had taken on the edge of St
Park, in what was then called Petty France,
inster, but is now York Street. The house existed
other day, but has been pulled down. In Milton's
was a villa-looking residence, with a garden, in
hbourhood of villas and gardens. He had now
do in the special work of his office, in consequence
increase of correspondence with foreign powers.
had for some time been in ailing health, and a
s of eyesight which had been growing upon him
lly for ten years had been settling rapidly, once his
over the answer to Salmasius, into total blindness
y, before or about May 1652, when he was but in
y fourth year, his blindness was total, and he could
t only with some one to lead him. Hence a re-
ement of his secretarial duties. Such of the duties
ould perform at home, or by occasional visits to the
l Office near, he continued to perform, but much of
time work was done for him by a certain, one of
well-known Germans named Weckherlin under the
tendence of Mr John Thurloe, who had succeeded
lter Frost in the general secretaryship. Precisely
time of a lull in Milton's secretaryship upon account
ll health and blindness we have to refer his two
companion sonnet *To the Lord General Cromwell* and
Sir Henry Vane the Younger. To about the same
r more precisely to the interval between May and
ber 1652, though the exact date is uncertain, we
refer the death of his only son, who had been born
official Whitehall apartments in the March of the
ng year, and the death about the same time of his wife, just after
l given birth to his third daughter, Deborah. With
ee children thus left him,—Anne, but six years old,
not four, and the infant Deborah,—the blind
lived on in his house in Petty France in such
ion as can be imagined. He had recovered enough
resume his secretarial duties, and the total number
his dictated state letters for the single year 1652
l to that of all the state letters of his predecessor
f secretaryship put together. To the same year
belong also three of his Latin *Familiar Epistles*.
ember 1652 there was published *Joannis Philippi
Responsio ad Apologiam Anonymi Cujusdam Tenebrionis*,
being a reply by Milton's youngest nephew, John
s, but touched up by Milton himself, to one of
pamphlets that had appeared against Milton for his
er of Salmasius. The ablest and most scurrilous
se, which had just appeared anonymously at the
with the title *Regii Sanguinis Clamor ad Coelum
us Parricidas Anglicanos* ("Cry of the Royal Blood
ven against the English Parricides"), Milton was
ng for his own attention at his leisure.

The 20th of April 1653 there was Cromwell's great
armed interference by which he turned out the small
nt of the Rump Parliament, dismissed their council
e, and assumed the government of England, Ireland,
otland into his own hands. For several months,
he acted only as interim dictator, governing by a
of his officers, and waiting for the conclusions of
lect body of advisers which he had called together
ll parts of the country, and which the Royalists
med "The Barebones Parliament." In December
however, his formal sovereignty began under the
f the Protectorate, passing gradually into more than
ip. This change from government by the Rump
's council to government by a single military Lord
or and his council was regarded by many as treason
republican cause, and divided those who had hitherto
he united Commonwealth's men into the "Pure Re
ns" represented by such men as Bradshaw and Vane,
and the "Oliverians," adhering to the Protector,
whose boundless admiration of Cromwell had shown
already in his Irish tract of 1649 and in his recent
was recognized as one of the Oliverians. He remained
Oliver's service and was his Latin secretary throughout
whole of the Protectorate. For a while, indeed, his
letters to foreign states in Cromwell's name were but
Mr Thurloe, as general secretary, officiating as C
right hand man in everything, with a Mr Philip Meadows
under him, at a salary of £200 a year, as deputy
blind Mr Milton in foreign correspondence and transl
The reason for the temporary exemption of Milton
routine duty may have been that he was then engaged
an answer, by command from the late Government,
the already mentioned pamphlet from the Hague called
Regii Sanguinis Clamor. Salmasius was now dead,
the Commonwealth was too feeble to suffer from
attacks; but no Royalist pamphlet had appeared
of so venomous a tone as to call for continuation of the Sal
controversy. Meanwhile, however, it was known
libel on Milton himself did appear from his pen
necessary. It came out in May 1654, with the
*Joannis Miltonis Angli pro Populo Anglicano Defensio
Secunda* ("Second Defence of John Milton, English
for the People of England"). It was one of the most
esting of all Milton's writings. The author of the
which it replied was Dr Peter du Moulin the young
naturalized French Presbyterian minister, then
about in English society, close to Milton; but, as
a profound secret and the work was universally att
on the Continent to an Alexander More,
minister of Scottish descent, then as much of a
celebrity in Holland, who had certainly many
printing in consultation with the now deceased Sal
and had contributed some portion of the matter,
had made Du Moulin the responsible person and
object of his excoriation. They were frightful e
If Salmasius had been slaughtered in the former *D*
Moulin was murdered and gutted in this. His
character was blasted by exposure of his antecedents
he was blazoned abroad in Europe as a detected
blackguard. The terrific castigation of Moulin, how
is but part of the *Defensio Secunda*. It contains p
of a singular autobiographical and historical volu
includes laudatory sketches of such eminent C
wealth's men as Fairfax, Lawrence, Whitwood, La
and Overton, together with a long panegyric on C
himself and his career, which remains to this day
preached for elaboration and grandeur by any extra
Cromwell from any later pen. From about the date
publication of the *Defensio Secunda* to the beginn
1655 the only especially literary relic of Milton's
his translations of Psalms i.–viii. in different metres
in August 1654, his translation of Horace, *Ode* I
probably about the same time, and two of his
Familiar Epistles. The most active time of his se
ship for Oliver was from April 1655 onwards
month, in the course of a general revision of official
under the Protectorate, Milton's salary of £288
hitherto was reduced to £200 a year, with a kind
definition of his office, recognizing it, we may s

was to continue to do all the ordinary Foreign Offic
under Thurloe, inspections but Milton was to be
in on special occasions. Hardly was the arran
made when a signal occasion did occur. In May 1
England was horrified by the news of the massacre
Vaudois Protestants by the troops of Emanuele H
of Savoy and prince of Piedmont, in consequence
disobedience to an edict requiring them either t

ative valleys or to conform to the Catholic religion. vell and his council took the matter up with all their , and the barrel of indignant letters on the subject ched in that month and the next to the duke of himself Louis XIV. of France, Cardinal Mazarin, the amongst the States-General of the United Provinces, e King of Sweden and Denmark were all by Milton. most famous *On the Late Massacre in Piedmont* was e private expressions to belong to the same occasion. ommonwealth in the case of the Vaudois tant was Cromwell, when, in August the correspondence of Milton's great Latin d t *Defensio* in answer to an ate attack wa in Marat had put forth on the new Mr attack on his character and his con in part of the experiment of that unfortunate clergy The first of Cromwell's Protectorate, s he was comparatively calm and He was in better health than usual, became his blindness with and cheerfulness, he was steadily busy with such important despatches to foreign powers on the Pro them in the height of his great foreign policy, and d with fear and detestation by all European monarch Gibraltar to the Baltic, chose to confide to d his house in Petty France seems to have been him at any given time since the Restoration his office, a meeting-place for friends and visitors, and a of peers and hospitalities. The four remaining rooms red six, one of them to young Mr Lawrence, n of the president of Cromwell's council and two of ner to Cyriack Skinner, belonged to the time of dose at the a dozen or no fewer than ten of his Latin *Familiar* s. The second marriage belongs to the nine years, beam even yet at the too brief consummation of the st time on the grand mean. life. The name of his wife was Katherine Woodcock. He married her e 12th of November 1656, but, after only fifteen , he was again a widower, by her death in childbirth nuary 1657-58. The child dying with her, only the daughters by the first marriage remained. The ing contrast which the home of Milton now sacred tribute to the memory of his second marriage the virtues of the wife he lived scarcely four Even that loss we find him turning to Cromwell. Mr ow having been cast off, Andrew Marvell had, in September 1657, been brought into to Milton's satisfaction, as his assistant or colleague Latin secretaryship, but d him from duty. Some of his greatest despatches romwell, including letters of the highest importance, s. XIV. Mazarin, and Charles Gustavus of Sweden to the year 1658.

would like to know precisely in what proportion s Milton and Cromwell took to each other. There scarcely any evidence to show what Cromwell but Milton left ample record of what s thoughts of Cromwell. "Our chief of men, who picked hath now brought us" (May 1652) and the on remained unmoved. He thought Cromwell the st and greatest of his generation, or of many nations, and he regarded Cromwell's assumption of supreme power and his retention of that power with a reign title, as the preservation of the republic, but olutely necessary to the preservation for the safeguard of the British Islands against a of the Stuarts. Nevertheless, under this prodigious ation of Cromwell there were political doubts and es. Milton was too much of a modern radical of the ne school in his own political views and sympathies he cannot but have been vexed by the growing conservatism of Cromwell's policy through his Protectorat his grand panegyric on Oliver in the *Defensio Sec* 1651 he had ventured to append cautions against se over-legislation, and over-policing, and he cannot thought that Oliver had been immaculate in these re through the four subsequent years. The attempt to an aristocracy and a House of Lords, on which Cr was latterly bent, cannot have been to Milton's Above all, Milton dissented *in toto* from Cromwell's policy. It was Milton's fixed idea, almost his idea, that there should be no such thing as an Estab Church, or state-paid clergy, of any sort or denomina mixture of denominations, in any nation, and that had been the connexion between church and state, by Constantine, that had vitiated Christianity in the and kept it vitiated, so Christianity would never flou need, but had been universal disestablishme dissent was of the clergy, and the propagation gospel were to the zeal of voluntary pastors, se ported, as suggested modestly by their flocks. He one time looked to Cromwell as the likeliest man to this great revolution in England. But Cromwell much meditation on the subject in 1652 and 165 come to the opposite conclusion. The conservation Established Church of England, in the form of a union of all evangelical denominations of Christians, w Presbyterians, or Independents, or Baptists, or mo Old Anglicans, that would accept state-pay with control had been the fundamental notion of his torate, persevered in to the end. This must hav Milton's deepest disappointment with the Olverian

Cromwell's death on the 3d of September 1658 l Protectorship to his son Richard. Milton and continued in their posts, and a number of the Foreign letters of the new Protectorate were of Milton's compo Thinking the time fit, he also put forth, in October new edition of his *Defensio Prima*, and, early in new English pamphlet, entitled *Treatise of Civil P Ecclesiastical Causes*, ventilating those notions of h the separation of church and state which he ha obliged of late to keep to himself. To Ri Protectorate also belongs one of Milton's Latin *E Epistles*. Meanwhile, though all had seemed quiet Richard at first, the jealousies of the army officers lef ion by Oliver, and the conflict of political elemc loose by Oliver's death, were preparing his downfa May 1659 Richard's Protectorate was at an end country had returned with pleasure to what was of pure republicanism; a government was in the hands of "the Restored L remnant of the pre-assembled remains of that Rump ment which Cromwell had dissolved in 1653. change so inevitable in the circumstances, or even ing, Milton adjusted himself. The last of his official performances in his Latin secretaryship a letters in the name of William Lenthall, as the spe the restored Rump, one to the king of Sweden and the king of Denmark, both dated May 15, 1659. the restored Rump, however, he seemed to have a cha his notion of church-disestablishment; and, accordi August 1659, he put forth, with a prefatory address copy, a large pamphlet entitled *Considerations t the likeliest means to remove Hirelings out of the* The restored Rump had no time to attend to such They were in struggle for their own existence w army chiefs; and the British Islands were in tha of hopeless confusion and anarchy which, after through a brief phase of attempted military gove (October to December 1659), and a second revival purely republican or Rump government (December

ary 1659–60), issued in Monk's march from Scotland, otion of the dictatorship in London, and recall of all rvivors of the original Long Parliament to enlarge the to due dimensions and assist him in further deliberations. Through all this anarchy the Royalist elements had mustering themselves, and the drift to the restoration Stuart dynasty, as the only possible or feasible solution, had become apparent. To prevent that issue, to against it and fight against it to the last, was the to which Milton had then set himself. His dissolution notion and all his other notions had been aside; the preservation of the republic in any form, any compromise of differences within itself, had his one thought, and the study of practical means and his most anxious occupation. In a *Letter to a ... concerning the Ruptures of the Common-wealth*, in October 1659, he had propounded a scheme of of dual government for reconciling the army chiefs, the Rump; through the following winter, marked only by of his Latin *Familiar Epistles*, his anxiety over the of the growing enthusiasm throughout the country recall of Charles II. had risen to a kind of agony. rly in March 1659–60 his agony found vent in a let of the most passionate vehemence entitled *The and Easy Way to Establish a Free Commonwealth, e Excellence thereof compared with the Inconveniences Dangers of readmitting Kingship in this Nation*. The gment of the practical substance of the pamphlet was ssed by him to General Monk in a letter entitled *The t Means and Brief Delineation of a Free Common*. Milton's proposal was that the central governing atus of the British Islands for the future should consist one indissoluble Grand Council or parliament, which l include all the political chiefs, while there should be rge number of provincial councils or assemblies sitting great towns for the management of local and county . The scheme, so far as the public attended to it at all, ceived with laughter; the Royalist demonstrations were ervid and tumultuous; and it remained only for the new ull parliament of two Houses which had been summ l under Monk's auspices, and which is now known as onvention Parliament, to give effect to Monk's secret nination and the universal popular desire. Not even would Milton be silent. In *Brief Notes on a late n*, published in April 1660, in reply to a Royalist dis by a Dr Griffith, he made another protest against call of the Stuarts, even hinting that it would be that Monk should become king himself; and in the month he sent forth a second edition of his *Ready Easy Way*, more frantically earnest than ever, the and containing additional passages of the most violent nciation of the royal family, and of prophecy of the dation and disaster they would bring back with them. was the dying effort. On the 25th of April the Convention Parliament met; on the 1st of May they resolved nously that the government by King, Lords, and Commons should be restored; and on the 29th of May Charles made his triumphal entry into London. The chief blicans had by that time scattered themselves, and n was in hiding in an obscure part of the city.

ow Milton escaped the scaffold at the Restoration is a ory now, and was a mystery at the time. Actually, e terrible course through the two Houses of the Convention Parliament of that Bill of Indemnity by which fates of the surviving regicides and of so many s of the chief republican culprits were determined, n was named for special punishment. It was voted e Commons that he should be taken into custody by sergeant-at-arms, for prosecution by the attorney ral on account of his *Eikonoklastes* and *Defensio Prima*, and that all copies of those books should be called in and burnt by the hangman. There was, however, some powerful combination of friendly influences in his favour with Monk probably abetting. At all events, on the 29th of August 1660, when the Indemnity Bill did come out complete, with the king's assent, granting full pardon all for their past offences, with the exception of about a hundred persons named in the bill as liable for various degrees of punishment, thirty-four of them for death and twenty-six for the highest penalty short of death, Milton did not appear as one of the excepted on any ground or in any of the grades. From that moment, therefore, he could emerge from his hiding, and go about as a free man. Not that he was yet absolutely safe. During the next two or three months London was in excitement over the trial of such of the excepted regicides and others as had not succeeded in escaping abroad, and the hangings and quarterings of ten of them, there were several public burnings by the hangman at the same time of Milton's condemned pamphlets, and the appearance of the blind man himself in the streets, though he was legally free, would have caused him to be mobbed and assaulted. Notwithstanding the Indemnity Bill, he was in some legal danger as late as December 1660. Though the prosecution ordered against him by the Commons had been quashed by the subsequent Indemnity Bill, the sergeant-at-arms had taken him into custody. Entries in the Commons' journals of December 17 and 19 show that Milton complained of the sergeant-at-arms for demanding exorbitant fees for his release, and that the House arranged the matter.

Milton did not return to Petty France. For the first months after he was free he lived as closely as possible to a house near what is now Red Lion Square, Holborn. Thence he removed, apparently early in 1661, to a house in Jewin Street in his old Aldersgate Street and Barbican neighbourhood.

In Jewin Street Milton remained for two or three years, or from 1661 to 1664. They were the time of his deepest degradation, that time of which he speaks when he tells us how, by the Divine help, he had been able to persevere undauntedly—

> ... the evil days
> On evil days though fall'n, and evil tongues
> In darkness, and with dangers compass'd round,
> And [illegible]

The "evil days" were those of the Restoration in fact or Clarendonian type, with its revenge and reaction, its return to high Episcopacy and suppression of every form of dissent and sectarianism, its new and shameless royal court, its open proclamation and practice of anti-Puritanism in morals and in literature no less than in politics. For the main part of the world of the Restoration Milton was now nothing more than an infamous outcast, the detestable blind republican and regicide who had, by too great clemency, been left unhanged. The few friends that adhered to him still, and came to see him in Jewin Street were few in number, and chiefly from the ranks of those nonconforming denominations, Independents, Baptists or Quakers, who were themselves under a similar obloquy. Besides his two nephews, the faithful Andrew Marvell, Cyriack Skinner, and some other of his former admirers, English or foreign, we hear chiefly of Dr Nathan Paget, who was a physician in the Jewin Street neighbourhood, and of several young men who would drop in upon him by turns, partly to act as his amanuenses and partly for the benefit of lessons from him, one of them an interesting Quaker youth, named Thomas Ellwood. With all this genuine attachment to him of a select few Milton could truly enough describe his condition at

storation as one of "solitude." Nor was this the His three daughters, on whom he ought now to gen able principally to depend, were his most serious ie trouble. The poor motherless girls, the eldest in enteenth year in 1662, the second in her fifteenth, youngest in her eleventh had grown up, in their blindness and too great self-absorption, ill looked nd but poorly educated and the result now d. They made nothing of neglecting him; they l against the drudgery of reading to him or other tendance on him they would combine together and he would even connive at numerous marketings, gradually filched away some of his books, and hasten the end. It was to remedy this horrible that Milton contracted for a third mar The wife selected for him was Elizabeth Minshull of Cheshire family, and a relative of Dr Paget married on the 24th of February 1662-63, the n then scarcely in her twenty-fifth year, while Milton his fifty-fifth. She proved an excellent wife and n Street household, though the daughters remained ht have been under better management from the her entry into it. From that date Milton's circum nced have been more comfortable, and his thought much his subject, than they had been through the ceding years, though his feeling in the main must en till that of his own Samson

... the house in Jewin Street, however, that ... finished. Not very long after the third ... in 1664, there was a removal to another ... which was not far from Jewin Street, but in a ... quarter of the same suburb. This, which ... Milton's London residences, was ... on Bunhill Row which faces the ... the Honourable Artillery ground and was ... known as "Artillery Walk, leading to Bunhill Fields." The poem was certainly finished before July 1665; ...n, in that month Milton and his family, to avoid ...reat Plague of London, then beginning its fearful ..., went into temporary country-quarters in a cottage ...lfont St Giles, Buckinghamshire, about 23 miles London, the unfinished manuscript was taken with ...n probably more than one copy. This we learn ...is young Quaker friend, Thomas Ellwood, who had the cottage for him, and who was shown one of the manuscript copies, and allowed to take it away with for perusal, during Milton's stay at Chalfont. Why poem was not published immediately after his return t Bunhill house in London, on the cessation of the Plague, does not distinctly appear, but may be expla partly by the fact that the official licenser hesitated b granting the necessary *imprimatur* to a book by a m such notorious republican antecedents, and partly by paralysis of all business in London by the Great Fire of tember 1666. It was not till the 27th of April 1667 Milton concluded an agreement with a publisher fo printing of his epic. By the agreement of that date extant, Milton sold to Samuel Simmons, printer, of A gate Street, London, for £5 down, the promise of anoth after the sale of a first edition of thirteen hundred c and the further promise of two additional sums of £5 after the sale of two more editions of the same size re tively, all his copyright and commercial interest in *Par Lost* for ever. It was as if an author now were to with all his right in a volume for £17, 10s. down, a contingency of £5, 10s. more in three equal instalm The poem was duly entered by Simmons as for publication in the Stationers' Registers on the 20 the following August, and shortly after that date it wa in London as a neatly printed small quarto, with the *Paradise Lost. A Poem written in Ten Books; By Milton*. The publishing price was 3s., equal to about 6d now. It is worth noting as an historical coinci that the poem appeared just at the time of the fal disgrace of Clarendon.

The effect of the publication of *Paradise Lost* Milton's reputation can only be described adequate indeed it was enormously described by himself in meta by his own words on Samson's feat of triumph ove Philistines:

> But he, though blind of sight,
> Despised and thought extinguished quite,
> With inward eyes illuminated,
> His fiery virtue roused
> From under ashes into sudden flame,
> And as an evening dragon came,
> Assailant on the perched roosts
> And nests in order ranged
> Of some tame villatic fowl, but as an eagle
> His cloudless thunder bolted on their heads."

As the poem circulated and found readers, whet the first copies sent forth by Simmons, or in subse copies issued between 1667 and 1669, with varied page, and the latest of them with a prefixed "Argument," the astonishment broke out everyw "This man cuts us all out, and the ancients too" saying attributed to Dryden on the occasion; and it more remarkable because the one objection to the which at first, we are told, "stumbled many" must "stumbled" Dryden most of all. Except in the d rhyme was then thought essential in anything prof to be a poem, blank verse was hardly regarded as ve all. Dryden especially had been and was the champ rhyme, contending for it even in the drama; and ye was an epic not only written in blank verse, but dec itself on that account to be "an example set, the f English, of ancient liberty recovered to heroic poem the troublesome and modern bondage of riming." notwithstanding this obvious blow struck by the po Dryden's pet literary theory, he should have welcome poem so enthusiastically and proclaimed its mer emphatically, says much at once for his critical pere and for the generosity of his temper. An opinio claimed by the very chief of the Restoration lite could not but prevail among the contemporary sel and, though execration of the blind and unhanged re

ceased among the meaner critics, the general vote
at he had nobly redeemed himself. One conse
of his renewed celebrity was that visitors of a
gain sought him out for the honour of his society
nversation. His obscure house in Artillery Walk,
, we are told, became an attraction now, "much
han he did desire," for the learned notabilities of
e.

year 1669, when the first edition of *Paradise Lost*
n completely sold out, and Milton had received his
£5 on account of it, may be taken as the time of
rfect recognition of his pre-eminence among the
poets of his generation. He was then sixty years
and it is to about that year that the account that
ome down to us of his personal appearance and
n his later life principally refer. They describe
to be seen every other day led about in the neigh-
vicinity of his Bunhill residence a dignified figure of
stature or a little less, generally dressed in a grey
r overcoat, and wearing sometimes a small sword,
sword, evidently in feeble health, but still look
nger than he was, with his light hair, and his
ther than aged or pale, complexion. He would sit
garden at the door of his house, in warm weather,
same kind of grey overcoat, "and in a well-a
on, received the visits of people of all ranks
as well as quality. Within doors he was usually
in neat black. He was a very early riser, and
gular in the distribution of his days, spending the
rt, to his midday dinner, always in his own room,
s books, with an amanuensis to read to him and
to his dictation. Music was always a chief part
afternoon and evening relaxation, whether when he
himself or when friends were with him. His
with friends and visitors was extremely courteous-
able, with just a shade of statelines. In his com
on, either at the midday dinner, when a friend or
ppened, by rare accident, to be present, or more
ally in the evening and at the light supper which
ded it, he was the life and soul of the company,
is "flow of subject" and his "unaffected cheerful
d civility," though with a marked tendency to the
l and sarcastic in his criticisms of men and things.
ndency to the sarcastic was connected by some of
who observed it with a peculiarity of his voice or
ciation. "He pronounced the letter r very hard,"
tells us, adding Dryden's note on the subject:
canina, the dog-letter, a certain sign of a satirical
He was extremely temperate in the use of wine or
rong liquors, at meals and at all other times; and
supper was over, about nine o'clock, "he smoked his
d drank a glass of water, and went to bed." He
d much from gout, the effects of which had become
nt in a stiffening of his hands and finger-joints, and
urring attacks of which in its acute form were very
. His favourite poets among the Greeks were
and the Tragedians, especially Euripides: among
tins, Virgil and Ovid; among the English, Spenser
akespeare. Among his English contemporaries he
t most highly of Cowley. He had ceased to attend
urch, belonged to no religious communion, and had
gious observances in his family. His reasons for
ere a matter for curious surmise among his friends,
e of the profoundly religious character of his own
but he does not seem ever to have furnished the
ation. The matter became of less interest perhaps
669, when his three daughters ceased to reside with
aving been sent out, at considerable expense, "to
ome curious and ingenious sorts of manufacture that
oper for women to learn, particularly embroideries
in gold or silver." After that the household in
consisted only of Milton, his wife, a single maid-
and the "man" or amanuensis who came in for the

The remaining years of Milton's life, extending t
that part of the reign of Charles II. which figu
English history under the name of "The Cabal Adm
tion," were by no means unproductive. In 1669
lished, under the title of *Accidence Commenced Gram*
small English compendium of Latin grammar tha
been lying among his papers. In 1670 there appea
a rather handsome form, and with a prefixed por
him by Faithorne, done from the life and the be
most authentic that now exists, his *History of Br*
the Norman Conquest, being all that he had been
accomplish of his intended complete history of En
In 1671 there followed his *Paradise Regained* and
Samson, bound together in one small volume, and
ample proof that his poetic genius had not exhau te
in the preceding great epic. His only publication
was a Latin digest of Ramist logic, entitled *Artis*
Logicæ Plenior Institutio, of no great value, and doubtles
an old manuscript of his earlier days. In 167
moment when the growing political discontent wi
government of Charles II. and the conduct of his
had last set forth in the special form of a "No P
agitation and outcry. Milton ventured on the dan
experiment of one more political pamphlet, in which
the title *Of True Religion, Heresy, Schism, Toleratio*
what best means may be used against the growth of
he put forth, with a view to popular acceptance, s
a version as possible of his former principles on the
distressed. In the same year appeared the second
of his *Minor Poems*. Thus we reach the year 16
last of Milton's life. One incident of that year
publication of the second edition of *Paradise Lo*
the poem rearranged anew into twelve books, in
the original ten. Another was the publication of
volume containing his Latin *Epistolæ Familiares*, t
with the *Prolusiones Oratoriæ* of his student-d
Cambridge,—the only letters thrown into a substitute
Latin state letters in his secretary hip to the C
wealth and the Protectorate, the printing of whi
stopped by order from the Foreign Office. A third p
tion of the same year, and probably the very last th
tated by Milton, was a translation from a Latin docume
Poland relating to the recent election of the hero
Sobieski to the throne of that kingdom, with the
Declaration or Letters Patent of the Election of this
King of Poland, John the Third. It seems to hav
out in London in August or September 1674. On
of the following November, being a Sunday, Milto
in his house in Bunhill of "gout struck in, or gou
at the age of sixty five years and eleven months
buried, the next Thursday, in the chancel of St
Cripplegate, he [illegible] other, a considerable co
attending the funeral.

Before the latter event, Milton, what with his inheritan
his father who with the liberal income of his Latin secret
must have been a man of very good means indeed. Sin
however, various heavy losses, and the encumbered all oth
had greatly reduced his estate, so that he left but £800 (s a
or over £2700 present value) besides furniture and household goo
a word of mouth will, made in presence of his brother Ch
he had bequeathed the whole to his widow, on the ground
had done enough already for his children in their mother's
portion of £1000 which had never been paid. But whe
relatives, the Powells of Forest Hill, were heavily bound t
were now in circumstances to make good. The daughte
the Powells probably abetting them, went to law with th
to upset the will, and the decision of the court was th
should receive £100 each. With the £600 thus left, the
after some further stay in London, retired to Nantwich

Cheshire. There, respected as a pious member of a local
st congregation, she lived till 1727, having survived her hus-
fifty-three years. By that time all the three daughters were
ead The eldest, Anne Milton, who was somewhat deformed,
lied not long after her father, having married "a ma-ter-
er," but left no issue: the second, Mary Milton, had died,
rried, before 1694, and only the third Deborah, survived as
as her step-mother. Having gone to Ireland, as companion
lady, shortly before her father's death she had married an
hom Clarke, a silk weaver in Dublin, to whom she returned
ondon about 1697, when they settled in the silk-weaving
ess in Spitalfields, rather cool sections in the world,
h lately some patriotic efforts were paid to Deborah, by
on and other members of the Milton Club. One of her sons, Caleb
e had come over to Massachusetts and had died there as
r head of East Greenwich in Rhode Island, leaving children, of whom
at some future time to visit London. Deborah, the wife of Deborah's
, became for the purposes of another pedigree-descent
the Irish Clarkes. Young, the stay-maker, went from
to open a shop in Exeter, Elizabeth Clarke, another
ghter, married a Thomas Foster, a
lkeld weaver, but afterwards took to the wool-combing and woollen-draper business, kept
n Holloway, retired to Stroud, and died at Upton in
not long after. Foster's widow and her husband received the pensions
mentioned, of £50 each, got up by Dr Johnson for the benefit
ir children, and had probably passed by leaving no trace. Milton
n Clarke, who had also been on the opposite side in
ics, came to the quiet Norfolk borough of Aylsham, kept a modest
n the latter part of the reign of Anne. He had been
n a Roman Catholic, which religion he probably did not be-
m retirement at Ipswich in 1667. Descendants from him
ascended a good way into the 19th century. Milton's two
ws and pupil Edward and John Phillips, both of the well-known
y and clever Oxford author before the Oxford-Cambridge
ance of later authorship, most curiously and variously
h not very prosperously, through the rest of their lives. Edward
more reputable manner than John, and with more of entanglement
ance to the memory of his uncle. Edward died about 1696
was alive till 1706. Then both sisters, Anne Agar the only
ter of Milton's sisters by her second husband, and Mrs
ch, a Dorothy Moore, of Saxon House, Chertsey, and other so
ened that the most flourishing of all the lines of descent from
oet's father is in the Agar Moore branch of the Milton
ily. Of manuscript that had been left by Milton, one portion
he Latin pedagogics, presented in the first year of his
s had been already printed, from public time to time, by Latin *Artis Logicæ*
Plenior Compendium, with his Latin *Grammatica Duplex*, he had com-
d the character of the *State Letters* prepared for the press, but
the completed manuscript of his Latin *Treatise of Christian*
ina, to a young Cambridge scholar, Daniel Skinner, who had
among the last of his amanuenses, and had, in fact, been
ed by him specially to copy out and transcribe those two
rtant MSS. Negotiations were on foot, after Milton's death,
en the Daniel Skinner and the Amsterdam printer Daniel
r for the publication of both MSS. when the English Government
interfered, and the MSS. were sent back to Whitehall, and
ere shelved and lost sight of in a dusty rubbish-hole in the State
Office. Meanwhile, in 1676, a London bookseller, named
who had somehow got into his possession a less perfect but
tely complete, copy of the *State Letters*, had brought
ut a translation of them, under the

ter posthumous publication of Milton's appointed till 1681
n had been silent put forth a slight tract entitled *Mr*
Parliament and Assembly's
a narrative of proceedings of two of rather dubious authen-
y, collected from his *History of Britain* in
ntinuation of the latter sequel *A Brief History of Moscovia*
and other Countries lying Eastward from Russia as far as Cathay
the Observations of Milton, and a specimen of the
compilations with which the interim occupied his heirs.
he title of the volume was the Latin *Defensio Secunda*, which had
ded to the Defensio and Vindiciæ all that is known is that
having been "Printed for some of his pedagogic
, they came into the hands of a committee of Cambridge
lars, and were at the University Press in 1693, called *The*
Bridge Dictionary, or, as the Latin *Dictionarium* and all
equent Latin dictionaries of any importance have been
d. In 1698 there was published, in two folio volumes, under
editorship of John Toland, the first complete edition of Milton's
works, professing to have been printed at Amsterdam, though
y printed in London. A second edition, in two folio volumes, pub-
d in 1713 by a John Nicholson, appeared under the title of
ral Letters and Papers of State written by Mr John Milton to
Cromwell,
sts of a number of intimate Cromwellian documents that had
how come into Milton's possession immediately after Cromwell's
, and were left by him confidentially to the Quaker Ellwood.

Finally, a chance search in the London State Paper Office in
having discovered the long-lost parcel containing the MSS. o
ton's Latin *State Letters* and his Latin *Treatise of Christian Do*
as these had been sent back from Amsterdam a hundred an
years before, the *Treatise on Christian Doctrine* was, by the com
of George IV., edited and published in 1825 by the Rev.
Sumner, keeper of the Royal Library, and afterwards bish
Winchester, under the title of *Joannis Miltoni Angli De Do*
Christiana Libri Duo Posthumi. An English translation,
editor, was published in the same year.

Information, rather than criticism, has seemed proper in
an article as the present. What little of closing remark is ne
will best connect itself with the obvious fact of the divis
Milton's literary life into three almost mechanically distinct p
(1) the time of his youth and minor poems, (2) his
twenty years of prose polemics, and (3) the time of his later
and greater poems.

Had Milton died in 1640, when he was in his thirty-second
and had his literary remains been then collected, he would
been remembered as one of the best Latinists of his generati
one of the most exquisite of minor English poets. In the
character, more perfect by, he would have taken his place
of that interesting, unique series of English poets, coming
next forty years after Spenser, who, because they all acknow
a kindred relation kip to Spenser, may be called collectivel
Spenserians. In the group of names, counting in it such oth
poets of the reigns of James I. and Charles I. as Phineas and
Fletcher, William Browne, and Drummond of Hawthornden,
would have been entitled, by the small collection of pieces
left, and which would have included his *Ode on the Nativi*
Il Penseroso and *Lycidas*, his *Comus* and his *Lucidas*, to r
tion a definitely distinct and highest. There was
that peculiar Spenserian something which might be regarded
poetic faculty itself, with a closeness and perfection of
such not to be found in the other Spenserians, or even
master himself. A very discerning critic might have gone
even we can now. However the pieces were, and owning disci
to Spenser as the author and, he was a Spenserian with a
one belonging to his own constitution, which prophesie
united already exhausted, the passage of English poetry
the Spenserian into a third that might be called the M
This Miltonic something distinguishing the new poet from
Spenserians was more than mere perfection of literary finish.
ried in an avowed consciousness already of the *os magna*
sonaturum," the mouth formed for great utterances," that conseq
to fling on a peculiar substratum of personal character th
occasioned a new theory of literature. "He who would
for a true poem" was Milton's own memorable exp
afterwards of the principle that had taken possession of him f
earliest days; and this principle of moral manliness as th
foundation of high literary effort, of the inextricable identit
literary productions in kind, and their coequality in worth
the personality in which they have their origin, might hav
detected, in more or less definite shape, in all or most of the
poems. It is in the form of that general Platonic doctrin
invincibility of virtue which runs through his *Comus*, and
summed up in the Miltonic motto of the closing lines:

"Mortals that would follow me,
Love Virtue: she alone is free.
She can teach ye how to climb
Higher than the sphery chime;
Or, if Virtue feeble were,
Heaven itself would stoop to her."

That a youth and early manhood of such poetical promise
been succeeded by twenty years of all but incessan
s been a matter of regret with many. Why
the au of *Comus* and *Lycidas*, instead of keeping to the
craft, l employed himself for twenty years in the drudge
tumon pieces of questions of church and
with nothing or the long morass but
chain of biographical and historical sonnets? Surely th
most shallow and most unmanly judgment. Is nothing
Milton's own explanation of the reasons that drew him,
beginning of the English Revolution, out of his literary proje
dreaming, and active partisanship with the cause which his
favoured? Was what he says would have been the reproach
own conscience to him, evening and morning, if he had ab
from such partisanship and persisted in his poetic privacy.
and leisure was given thee for thy retired thoughts out of th
of other men. Thou hadst the diligence, the parts, the la
of a man, if a vain subject were to be adorned or beautifie
when the cause of God and His church was to be pleaded, fo
purpose that tongue was given thee which thou hast, God
if He could hear thy voice among His zealous servants, b
wert dumb as a beast: from henceforward *be* that which thi
brutish silence hath made thee." Or, if this should be in too
strain for the ordinary modern apprehension, may not one as

whether such controversial work as Milton did plunge
d persevere in for twenty years, was unworthy, after all, of
his powers? Do not hundreds of men, accounted among
est in the world, spend their lives precisely in such work
roversy on contemporary questions; and are not some of
n of noblest reputation in the world's history remembered
ning else? If Burke, whose whole public career consisted
accession of speeches and pamphlets, is looked back upon
of the greatest men of his century on their account why
there be such regret over the fact that Milton, after having
e author of *Comus* and *Lycidas*, became for a time the prose
of *his* earlier and more tumultuous generation? The truth is
is not his exchange of poetry for prose oratory that is
l to, so much as the nature of his prose oratory, the side he
e opinions he advocated. English scholarship and English
criticism have not yet sufficiently recovered from that
ed sycophancy to the Restoration which has been covered with
he preceding twenty years of the "Great Rebellion," voting
eriod of English history to be mere pestilence and all its
nena of Presbyterianism, the Solemn League and Covenant
rdeney, the sects, English republicanism &c., to be mere
fete jargon, less worthy of attention than a Roman triumph
the names of Horace's mistresses. When this one-sided July
temper has passed, there will be a reaction to do justice
between Milton as the poet and Milton as the prose writer
some may recognize, with the lucidity of a event and prove in-
e fact that there are in Milton's prose writings no items of
alue and consequence that have not yet been thrown into
glish political mind, there will be a general agreement at least
he importance of those pamphlets is concerned. It will be
ed that he was not only the greatest poet but one of the
ion, head and shoulders above the rest, for a time. But there
fe of that time, not even Cromwell excepted, in the history
great Revolution in its successive phases, has as the deep
ring ideas and speculations were concerned, more to be more
ely and instructively studied than in Milton. Then on
literary ground, what an interest in those prose treatises
ly of his *Areopagitica*, admired now not so much because
doctrine has become axiomatic but of most of his other
ets, even those the doctrine of which has been popular, it may
confidently that they are wrong to the common definition of "a
ook," by containing somehow "the precious life-blood of a
spirit." From the entire series there might be a collection
mens, unequalled anywhere else, of the controversialist of that
gander, and more elaborate. Each in piece of which the
thans and their immediate successors were not ashamed,
it has fallen into disrepute now in comparison with the
nd nimbler prose which came in with Dryden. Nor will
of Milton's pamphlets cease to accept the long-received
tion that his genius was destitute of humour. Though his
ng mood was the severely earnest, there are pages in his
ritings, both English and Latin, of the most laughable
reaching sometimes to extravagance, and some of them
hy of the name of humour as any thing in Swift. Here,
r, we touch on what is the worst feature in one of the prose
ets,—their measureless ferocity, their homicidal license in
l scurrility. With all allowance for the old custom of those
hen controversy was far more of a life-and-death business
is now, as well as for the intrinsic soundness of Milton's
always discerning the *man* behind the *book*, it is impossible
most tolerant of modern readers to excuse Milton in this
to the full extent of his delinquencies.

e it is wrong to regard Milton's middle twenty years of
olemics as a degradation of his genius, and while the fairer
ion might be that the youthful poet of *Comus* and *Lycidas*
y promoted himself, and became a more powerful agency in
ld and a more interesting object in it for ever, by consent-
ay aside his "singing robes" and spend a portion of his life
t prose oratory, who does not exult in the fact that such a
s rounded off so miraculously at the close by a final stage of
sory calm, when the "singing robes" could be resumed, and
se Lost, *Paradise Regained*, and *Samson Agonistes* could issue
ression from the blind man's chamber? Of these three
and what they reveal of Milton, no need here to speak at
. *Paradise Lost* is one of the few monumental works of the
with nothing in modern epic literature comparable to it
the great poem of Dante. This is best perceived by those
netrate beneath the beauties of the merely terrestrial portion
story, and who recognize the coherence and the splendour of
st symbolic phantasmagory by which, through the wars in
and the subsequent revenge of the expelled archangel it
forth the connexion of the whole visible universe of human
nce and history with the grander, pre-existing, and still
ing world of the eternal and inconceivable. To this great
aradise Regained is a sequel, and it ought to be read as such.
gend that Milton preferred the shorter epic to the larger is
ncorrect. All that is authentic on the subject is the state-
ment by Edward Phillips that when it was reported to
that the shorter epic was "generally censured to be much
to the other," he "could not hear with patience any such
The best critical judgment now confirms Milton's own,
nounces *Paradise Regained* to be not only, within the pos
of its briefer theme, a worthy sequel to *Paradise Lost*, but
of the most edifying and artistically perfect poems in any
Finally, the poem in which Milton bade farewell to the M
in which he reverted to the dramatic form, proves that to
end his right hand had lost none of its power of cunning.

Lycidas is the most powerful elegiac poem in our language
even Greek model, and it has the additional interest of
contrived that, without strain at any one point or in any
to play, of the strictly objective accident of the Biblic
which it enshrines, it is yet the poet's own epitaph and
deed of autobiography. All in all, now that those thr
poems of Milton's later life have drawn permanently m
compose the beautiful and more simple performances of h
and early manhood, so that we have all his English poetr
vols. at once, the result has been that this man, who wou
had to be remembered independently as the type of English
beauty and political courage is lauralled also as the supre
of his nation, with the single exception of Shakespeare.

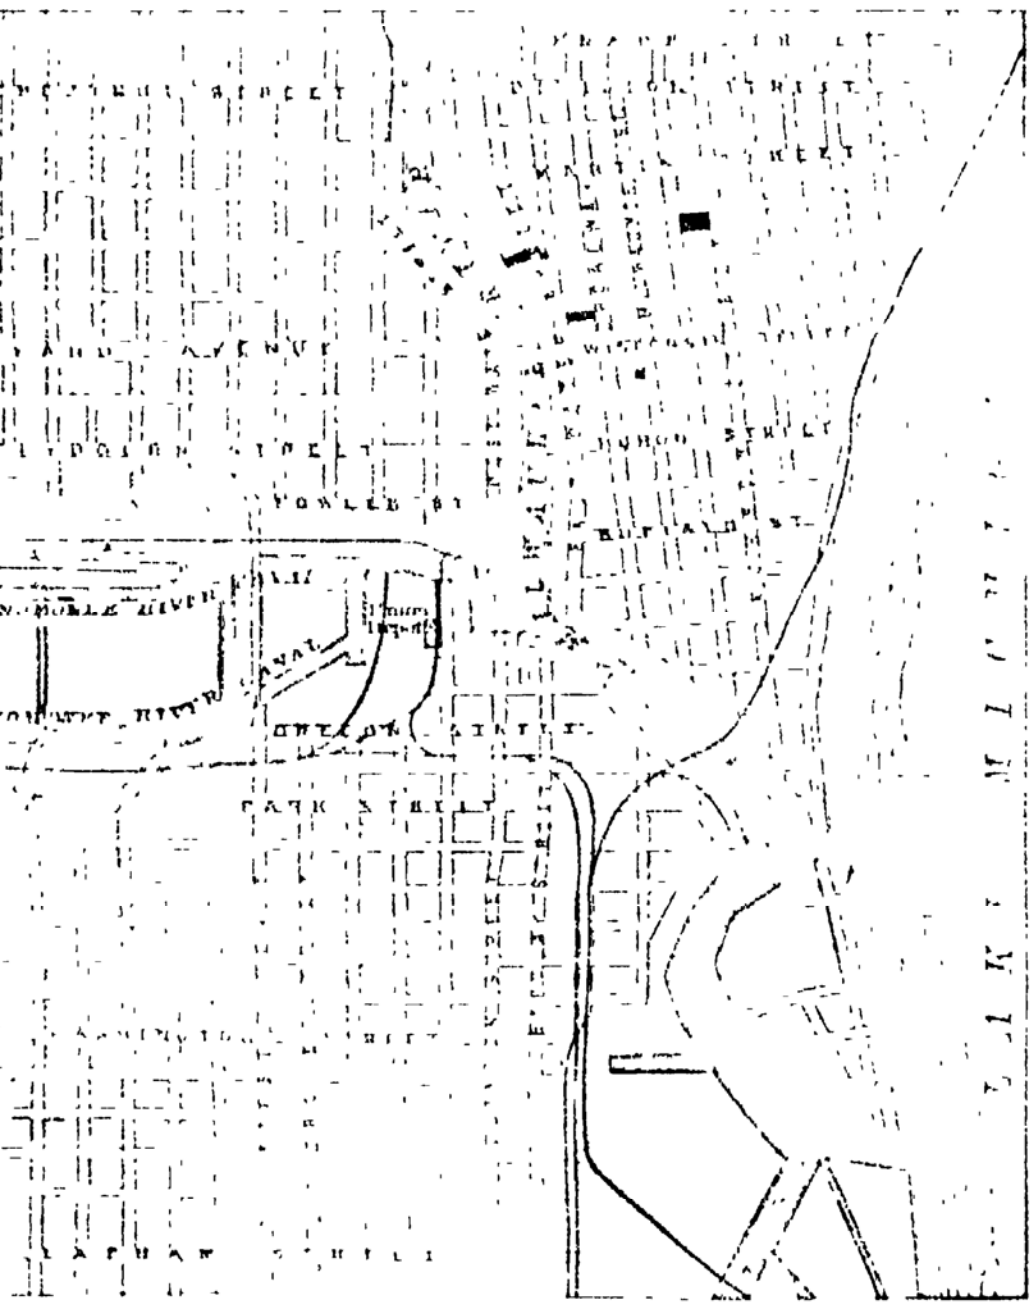
Much light is thrown upon Milton's mind in his later
even upon the poems of that period, by his posthumous
Treatise of Christian Doctrine. It differs from all his other
writings of any import as an elaborate cool abstract, and c
Protestant to be a system of doctrines derived directly from th
it is really an expression of Milton's own deliberate and matured
opinions on all questions of theology, ethics, and politics
general effect is to show that, though he was fully recognized
very centre of Church Puritanism, its representative p
intellect, yet he was not a Puritan of what may be called
wave, or that wave of Calvinistic orthodoxy which broke
the absolutism of Charles and Laud and of the English
tion against it. He belonged distinctively to that later and m
salient wave of Puritanism which, previous to the throne
pendency, included at least in its endless variety of sects,
their rationalistic and free thinking to the extreme left
by the time of the Restoration, it had to contract itself vol
a whole, and to disappear, so far as it could disappear at all
new and subtler embodiments that have ever since been known
Liberalism. For example, the treatise shows that Milto
later life was not an orthodox Trinitarian but an anti-Tri
of that high Arian order common since Sir Isaac Newton a
subsequent English philosophers which denied the co-essent
coequality of Christ with the Father but regarded him as
with a certain derivative dignity and authority of his own
It shows him also to have been Arminian, rather than Cal
in his views of free will and predestination. It shows
have been no Sabbatarian like the Puritans of the m
but most strenuously anti-Sabbatarian. Indeed, one of
is that the Decalogue is no longer the standard of human
and that Christian liberty is not to be bounded by
or by any accidental code of ethics founded on it. H
the treatise is not only a repetition of Milton's views on
more subject but of other portions of his theology
forth in his prose pamphlets but more full and minute and
opinion-bearable. By far the most important revelation
treatise, however, consists in the very definite statement
of Milton's metaphysical creed, out of the connexion of th
in his mind with the Cambridge Platonists of Christianity.
ontological sky, he had learned a pure spiritualistic theism,
the notion of one infinite and eternal Spirit as the self-s
God and author of all being, ontologically he was a form
of a pantheistic speculation which conceives all the phen
nena of all that we call the universe, or countless diverse modi
manifestation or activity of one grand matter which was o
nothing else than an utterly emanation from the very
God. Angels and men no less than the brute world
three worlds are but successive transformations from the one original
by no breach of continuity and endowed with God and
Hence any ethical distinction between matter and spirit
soul is Milton's bold fallacies. The soul of man is no
not something separate from the body of man and capable of
apart, but is to its being up with the bodily organism
time, when the body dies, the soul dies also, and the wh
ceases to exist. The immortality revealed in Scripture is
not a continued existence of the soul in its immaterial
immediately after death, but a miraculous revival of the wh
soul and body together, at the resurrection, after an inte
sleep. In such a resurrection, with a final judgement, a
Christ, and a glorification of the saved in a new heaven an
earth, Milton declares his absolute belief. But, indeed, th
the treatise, with all its differences from the orthodox in
tions of the Bible, nothing is more remarkable than the p
ness of the reverence avowed for the Bible itself. The ve

of the treasure that as the Bible is a revelation from things that man could not have found out for himself, all the Bible says on any matter is to be accepted implicitly, in the sense of the words, and without objection, however it may seem to the natural human reason. Hence, in all essentials of Christianity which concern the doctrines of salvation, atonement by Christ, and regeneration and sanctification through Christ, Milton relies on the great body of [illegible]. Although what the theologians call the [illegible] were not the only [illegible] he drew from [illegible] other books in the [illegible] the Septuagint [illegible]

[illegible] (D. M.)

MILWAUKEE, the largest city in the State of [illegible], United States, is situated on the west shore of Michigan, 100 miles north of its southern end, 80 south of Chicago, and 1090 miles north-west of New York, and in 43° 2′ N. lat., 87° 56′ W. long. (11 min. Washington time). The shore of the lake is 600 feet above the level of the sea.

Milwaukee and Menomonee rivers unite in the south-eastern portion of the city, about half a mile from their entrance to Lake Michigan, where they are joined by a third and smaller stream, the Kinnickinnic. The city is 6 miles from cape to cape, and 3 miles broad, and [illegible]



Plan of Milwaukee.

[illegible] in front of the city, which commands a fine water [illegible] the ground rising along the [illegible] 80 feet above the [illegible] the lake, then gradually slopes westward to the [illegible]kee river, and again rises on the west and north [illegible]ght of 125 feet. The ground also rises to a commanding elevation south of the valley of the Menomonee. [illegible]ties present so many natural attractions of site, as indeed its Indian name indicates ("the beautiful land or bay"); and art has added to nature. In the residential parts of the city there are miles of avenues from 70 to 100 feet wide, lined on both sides with elms and maples, behind which stand handsome houses with spacious lawns, fountains, and evergreens, giving the appearance of one continuous park. The material used for building is largely the cream coloured brick made in the vicinity, from which Milwaukee is sometimes called the "Cream City." The climate, tempered by the great lake, is remarkably pure and healthy. The mean temperature, as shown by the records of twenty years, is 46·7 Fahr.[1] The hottest month is January (average 22°·37), the hottest July (70°·1). During the last nine years the average death-rate has been but 20 per 1000, showing it to be one of the healthiest of American cities. Besides a full complement of the usual hospitals and charitable institutions, there is adjoining the city the national home for disabled United States volunteer soldiers, consisting of several buildings situated in grounds of 100 acres extent, which serve the purpose of a city park. There are numerous lodges belonging to the trades unions and other guilds; and the Turnverein Society, which embraces a large membership and owns valuable buildings, have done much to create and foster the practice of athletic exercises among the citizens. Excellent musical societies are also established here.

Before the year 1835 Milwaukee was known only as an Indian trading post occupied by a Frenchman named Solomon Juneau, who is generally spoken of as the founder of the city. The total inhabitants in 1838 numbered 700, in 1840 there were 1712, but in 1846 the population amounted to 9626, in 1850 to 20,061, in 1860 to 45,246, in 1870 to 71,440, and in 1880 to 115,578 (57,475 males, 58,103 females). In 1888 the population was estimated at 130,000, more than half of them of foreign parentage, a very large number being Germans. Notwithstanding the multitude of races represented in the population, there are few cities more orderly and law-abiding, the number of police employed being less than one for every 1500 inhabitants. Another feature worthy of mention is the large proportion of families who own their own houses, and this is true not only as to the mercantile and professional classes, especially as to the labouring population. Although grain trade, formerly very large here, has now greatly diminished, the growth and prosperity of the city has not materially suffered, owing to the development of manufacturing industries, for which the low rents, healthy climate, and advantageous location make it well adapted. About one-sixth of the population are engaged in the manufacture of clothing, cigars, cooperage, leather, bricks, sashes, doors, blinds, machinery, and flour (of which one million of barrels are annually made), and in meat-packing. Milwaukee has become famous for its "lager beer," of which there are over a million of barrels annually produced, valued at $8,000,000. The lake commerce is very large. The tonnage entered and cleared in 1880 was 5,322,373 tons, being almost as large as that of Baltimore, Boston, or Philadelphia. The Wisconsin Central, the Milwaukee and Lake Shore, the Milwaukee and Northern, and the Chicago, Milwaukee, and St. Paul Railways have their head offices here, the last-named owning 4000 miles of lines, has its chief workshops in the Menomonee valley near the city.

Milwaukee is governed by a mayor and a common council of thirty-nine aldermen. The streets and public buildings are under the charge of the board of public

[1] The monthly averages for twenty years are:—January, 25°·13; February, 25°·13; March, 32°·35; April, 43°·94; May, 55°·39; June, 64°·39; July, 70°·04; August, 67°·89; September, 59°·61; October, 48°·48; November, 36°·27; December, 25°·53.

ed of three commissioners and the city engineer, all to the common council. A bountiful supply of s obtained from the lake, and the streets are well d with sewers. The value of property as assessed for n was $62,000,000 in 1882, the city debt being ,000, mostly for the water-works, which are city y.

e is an efficient system of public schools under a tendent and board of school commissioners, the f the buildings with their sites being estimated at 00. For the higher education there are a high school, al school, and three commercial colleges while the Catholics and Lutherans have several excellent national seminaries and colleges. A public library ing to the city contained 20,000 volumes in

(C. A.)

MICRY is the name given in biology to the advan resemblance (usually protective) which one species nal or plant often shows to another. The word wa plied in this metaphorical sense by Mr W H Bate , has since been accurately defined and limited, in it eal application, by Mr A R Wallace Briefly put, ence of the phenomenon of mimicry consists in the ng relation. A certain species of plant or animal es some special means of defence from enemies, s a sting, a powerful and disagreeable odour, a ns taste, or a hard integument. Some other species ing the same district or a part of it, and not itself ed with the same special means of defence, closely les the first species in all external points of form lour, though often very different in structure and ed in the biological order. For example, a South an family of butterflies, the *Heliconidæ*, are distin d by their very varied and beautiful colours, and low and weakly flight; they might easily be ed by insectivorous birds, but their remains are never on the ground among the rejected wings of other flies which cover the soil in many places. They also a strong pungent odour, which clings to the fingers ny days; and this fact led Mr Wallace to suspect ey have a disagreeable taste, and would not therefore eaten by birds after a single trial. Mr Belt has xperimentally proved the truth of that belief. But the totally distinct family of the *Pieridæ*, most of are white, there is a genus of small butterflies, as *Leptalis*, edible by birds, some species of which ite like their allies, while the greater number exactly le one or other of the *Heliconidæ* in the peculiar and colouring of their wings. As regards structure, o families are widely different; yet the resemblance ecies of one family to a species of the other is often se that Mr Bates and Mr Wallace, experienced ologists, frequently mistook them for one another at ne of capture, and only discovered their mistake nearer examination. Mr Bates observed several or varieties of *Leptalis* in the Amazons valley, each ch more or less exactly copied one of the *Heliconidæ* own district. Accordingly, they seem to be mistaken ds for the uneatable insects they mimic, and so to be ed by their resemblance. This, which may perhaps arded as the most typical instance of true mimicry, the first to which the word was applied.

onsidering the phenomena under review, it may be give first the chief observed facts, which are quite ndent of any particular explanation, and then the which has been started to account for them by Mr and Mr Wallace. Before doing so, however, true ry should be carefully discriminated from one or uperficially similar modes of resemblance among e beings, whose real implications are very different. It must not be confused with mere accidental or a resemblance, due either to simple chance or to sim of external conditions. As a case of the first sort, w adduce the real or fancied resemblance between orchids and flies or spiders; as a case of the secon we may take certain African *Euphorbiaceæ*, which, g in dry deserts, have acquired a very close likeness cactuses that cover the equally dry deserts of Mex again the sub-Antarctic gallinaceous bird, *Chloni* which, living on the sea-shore, has acquired a col like that of the gulls, together with the loss of a These resemblances, however, do not at all affect function. The species apparently mimicking an species apparently mimicked either do not inhab same district or do not come into any definite relatio one another. The likeness is either accidental, or is due to similar adaptation to similar circumstance case of true mimicry, on the other hand, the mim species derives a direct advantage from its likeness species mimicked the resemblance is deceptive a is equally true whether we suppose the mimicry to duced by creative design or by natural selection. Or hypothesis, however it came by its likeness, the mim species escapes certain enemies or obtains certain food by virtue of its resemblance to some other kind

It should also be added that the word mimi applied to such cases is used only in a metaphorical It is not intended to imply any conscious or vo imitation by one species of the appearance or ha another. All that is meant is the fact of an advanta resemblance, a deceptive similarity, which gives the mim animal or plant some extra protection or some special of acquiring food which it would not otherwise ha sessed but for its likeness to the creature mimicked

Taking animal life, mimicry does not occur frequently among the higher classes. In the vertebr is comparatively rare, and among mammals probably one good case has yet been adduced. This is *Cladobates*, an insectivorous genus of the Malayan many species of which closely resemble squirrels in colour, and in the bushiness and posture of the ta has been suggested by Mr Wallace (from whom the following examples have been borrowed) that *Cl* may thus be enabled to approach the nuts and fru which form its prey under the direction of the b fruit-eating squirrel. In the case of mammals other resemblances are not protective, but are apparently in the animal or the species for food.

Among birds Mr Wallace has pointed out th general likeness of the cuckoos, a weak and dete group, to the hawks and falconine tribe make approach to true mimicry. But here such vagueness blance there are one or two very distinct cases mimicry in the class of vertebrates. In Australia the Moluccas there is a genus of dull-hued honey *Tropidorhynchus*, consisting of large, strong, active with powerful claws and large beaks. They together in noisy flocks, and are very pugnacious, as to crows and even hawks. In the same countries a group of orioles, forming the genus *Mimeta*, and which are much weaker birds, have not the usual b colouring of their allies the golden orioles, but are olive-green or brown. In many cases species of closely resemble the *Tropidorhynchi* inhabiting th island. For example, on the island of Bouru are the *Tropidorhynchus buceroides* and *Mimeta bou* the latter of which mimics the former in the lars thus noted by Mr Wallace: "The upper and surfaces of the two birds are exactly of the same dark and light brown. The *Tropidorhynchus* has

ack patch round the eyes; this is copied in the by a patch of black feathers. The top of the head *Tropidorhynchus* has a scaly appearance from the scale formed feathers, which are imitated by the feathers of the *Mimeta* having a dusky line down The *Tropidorhynchus* has a pale ruff formed of recurved feather on the nape (which has given the eme the name of friar bird), that is represented in *neta* by a pale band in the same position. Lastly, of the *Tropidorhynchus* is raised into a protuberant the base, and the *Mimeta* has the same character, h it is not a horn as in the genus. The is that on a careful examination the bird ntical although they have important structural es, and cannot be placed near each other in any arrangement. Allied species of *Tropidorhynchus* n and Timor are similarly mimicked by the local of each island. Mr Osbert Salvin has likewise a case of mimicry among the birds of prey near ores. An insect eating hawk, *Harpagus diodon*, is sembled by a bird eating hawk, *Accipiter poliocus*. advantage seems to be that the small birds have not to fear the *Harpagus*, and the *Accipiter* is trade upon the resemblance by catching them , both birds being reddish brown when seen from . But the *Accipiter* has the wider range of the d where the insect eating species is not found it r resembles it, but varies in the under wing coverts . Here again the resemblance though advantage not protective.

e reptile, Mr Wallace has instanced some common ere a venomous tropical American genus of snakes, with brightly banded colours, is closely mimicked ral genera of harmless snakes, having no affinity but inhabiting the same region. Thus the poisonous *ps zalea* of Guatemala has black band on coral and the harmless *Pliocercus equalis* of the same is coloured and banded precisely like it. The affords the unarmed snake a great protection, other animals probably will not touch them, nt hem for the venomous kinds.

among the invertebrate- however especially nsect, that cases of mimicry are most frequent and t observed. In the order *Lepidoptera*, to which the mutants of *Leptalis* and the *Heliconida*, a similar her family, the *Ithomiida*, also mimics the same. The flocks of one species of *Ithomia*, are met with x, often have flying with them a few individuals ther widely different genera, quite unlike them en when on the wing. In the tropics of the Old the *Danaida* and *Acraida* possess a similar protec- and are equally abundant in individuals, they mimicked by various species of *Papilio* and Mr Trimen, in a paper on "Mimetic Analogies Malayan Butterflies," gives a list of sixteen species of ... and thirteen species of *Papilio*, which mimic a *Danais* or *Amaura* of the same in the general pattern of form and colour. *Danais* ... in having a semi-transparent bluish and a border of reddish brown; the coloration is reproduced in *Papilio* by a *Diadema mima*, e insects frequently come together in collections archipelago. In the Aru Archipelago the common utiful *Euploea* ... exactly mimicked by e species of *Papilio*. Mr Wallace generally the latter at first for the ordinary insect. An number of other instances among the *Lepidoptera* en quoted from other parts of the world sionally species of *Lepidoptera* also imitate insects order. Many of them take on the appearance of bees or wasps, which are of course protected by their sti Thus the *Sesiidæ* and *Egeriidæ*, two families of diu moths, have species so like hymenopterous insects they are known by such names as *apiformis*, *vespifo ichneumoniformis*, *sphegiformis*, and so forth. The Bri *sesia bombyliformis* closely resembles the humble bee; *Sphecia crabroniformis* is coloured like a hornet, and ca its wings in the same fashion. Some Indian *Lepidop* have the hind legs broad and densely hairy, so as exa to imitate the brush legged bees of the same country. Belt mention a Nicaraguan moth, *Pionia lycoides*, w closely mimics a distasteful coleopterous genus, *Calopte* and Prof. or Westwood pointed out that the resembl to the beetle is still further increased in the moth by ra lines of scales running lengthwise down the thorax.

Among the *Coleoptera*, or beetles, and other ord similar disguises are not uncommon. Mr Belt not species of *Hemiptera* and *Coleoptera*, as well as spider Nicaragua, which exactly resemble stinging ants, thus no doubt escape the attacks of birds. The ge *Calopteron* is mimicked by other beetles, as well as by moth *Pionia*. In the same country, one of the *Hemip Spongophora lateralis*, has every part coloured like the hon *Proconnus*, which it mimics, "in its vibrating colou wing cases it departs greatly from the normal characte the *Hemiptera*, and assumes that of the hornets." Wallace mentions the longicorn beetle, *Cyclopeplus lan* which "differs totally in outward appearance from e one of its allies, having taken upon itself the exact sh and colouring of a globular *Corynomalus*, a little stin beetle, with clubbed antennæ." *Erythroplatis corall* another longicorn, almost exactly resembles *Cephalod spurupes*, one of the common South American *Hisp* which possesses a disagreeable secretion; and Mr B also found a totally different longicorn, *Streptol hispoides*, which resembles the same insect with e minutenes. Some of the large tropical weevils have elytra so hard that they cannot be pierced by a b beak; and these are mimicked by many other comparati soft and eatable insect. In southern Brazil, *Acanthol dorsalis* closely resembles a *Curculio* of the hard g *Hedyphus*, and Mr Bates found *Gymnocerus cratosomo* a longicorn, on the same tree with the hard we *Cratosomus*, which it mimics. Other beetles resem bees, wasps, and shielded bugs. Hairy caterpillars well known to be distasteful to birds, and comparati free from attack, and Mr Belt found a longic *Desmiphora fasciculata*, covered with long brown black hairs, and exactly mimicking some of the sh thick, woolly caterpillars common on the bushes aroun

Amongst other orders, one of the most interesting c is that of certain *Diptera* or two-winged flies which m wasps and bees. Sometimes this likeness only serve protect the insect from attack, by inspiring fear of a st But there are also a number of parasitic flies whose la feed upon the larvæ of bees, as in the British g *Volucella* and these exactly mimic the bees, so that ... enter ... hives to deposit their eggs wit become detected even by the bees themselves. In c country where such flies occur they resemble the ne bees of the district. Similarly, Mr Bates found a sp of *Volucella* on the Amazons which exactly mimicked white ant on which it fed. On the other hand, defenceless species itself may mimic its persecutor, t the case of several crickets, *Scaphura*, that exactly resem wasps and wasps, and so escape the depredation those cricket killing enemies. Another cricket from Philippine Islands, *Condylodera tricondyloides*, so cl copies a tiger beetle, *Tricondyla*, that even Profe Westwood long retained it among that group in his cab

only slowly discovered his mistake. The cases here
ioned form but a small part of all those that have
rto been observed and described in the insect world.
amount altogether to many hundreds.
nong plants, though included in the above definition
the sake of formal completeness, instances of true
ery are rare or almost unknown. Perhaps the nearest
oach to this phenomenon in the vegetal world is found
e resemblance borne by the dead nettle, *Lamium*
m, and a few other labiates, to the stinging nettle,
a dioica and *U. urens*. The true nettles are strik
protected from animal foes by their stinging hairs.
the general appearance of the dead nettle is sufficiently
them to prevent human beings from plucking it, and
fore probably to deter herbivorous mammals from
g it down. Mr Mansel Weale mentions another
te, *Ajuga ophrydis*, of South Africa, which closely
bles an orchid, and may thus induce insects to
ize its flowers. Mr Worthington Smith has found
rare British fungi, each accompanying common
es which they closely resembled, and one of the
ion species possesses a bitter and nauseous taste, so
this would seem to be a case of true mimicry. Many
se instances alleged by Mr A. W. Bennett, Dr Cooke,
others cannot be considered as genuine mimetic resem-
es in the sense here laid down. They are mere
idences or similar adaptations to make weed; and
word ought to be applied strictly to such likenesses
as benefit the organism in which they occur by caus-
to be mistaken for another possessing some special
ntage of its own.

theoretical explanation of mimicry on evolutionary principles
ust be considered in connexion with the general subject of
tive coloration and variation in form of which it is a very
l case. There are two ways in which imitative colouring may
t a species. It may help the member of the species to escape
otice of enemies, or it may help them to deceive prey. In the
se imitative hues enable the animal or plant to avoid being
devoured, in the second case they enable it to devour
more easily, and so to secure a larger amount of food than
eceptively coloured competitors. In the former instance we
suppose that such individuals as did not possess the deceptive
ing have been discovered and destroyed by enemies with
developed sight, while those which possessed it have survived.
latter instance we must suppose that the individuals which
o protective colouring have failed to secure sufficient prey,
gh too readily betraying their presence, and that only those
possessed such colouring have become the parents of future
ations. It is difficult, however, to separate these two cases,
n many instances the same colouring may aid a species both
aping its peculiar enemies and in deceiving its peculiar prey.
may therefore most conveniently be considered together.

our is always liable to vary from individual to individual, as
in the case of domesticated fowls, rabbits, dogs, and other
ls, as well as in most cultivated flowers, wherever natural
ion cannot act to keep the typical specific hues pure and true.
n a wild state certain conspicuous colours are sure to prove
vantageous by betraying the individual, and these will sooner
er get weeded out, under certain circumstances either through
ction of enemies or by starvation resulting from the inability
cape the notice of prey. On the other hand, certain other
rs are sure to benefit the individual by harmonizing with the
of the environment, and these will be spared by natural
ion, so that the individuals possessing them will pass with
nother, and will hand down their peculiarities to their de-
ants. In this way many species will acquire and retain a
ation that harmonizes with their environment as a whole or
some special part of it. The degree to which the protective
ation will be carried, however, must depend upon the sharp
of the senses in those other organisms which it renders liable to
ve. Large dominant herbivorous or frugivorous mammals or
, with relatively few enemies, would not be benefited by
tive coloration, and so they seldom exhibit it. The grasses
its on which they feed cannot make any attempt to escape
. But carnivores generally require to deceive their prey, and
fore a large number of them exhibit marked deceptive colouring;
more especially do small defenceless birds or mammals need
cape the notice of the carnivores, and they accordingly very
ally possess dull colours, because any variation in the direction
of conspicuousness is certain to be promptly cut off. Al
among insects, which are so largely the prey of birds, of
and of other animals possessing highly developed vision, pr
coloration in one form or other is almost universal, excep
a nauseous taste, hairy skin, or hard external covering a
different kind of protection. In every case the weeding
ill-protected forms must depend upon the relative keenness
in the various enemies or of the prey, be they mammals
reptiles, insects, or spiders. Hence the existence of pr
coloring and of mimicry incidentally affords us valuable
to the perceptive faculties of the various classes against wh
organisms are thus unconsciously guarded.

Where the general aspect of the environment is most u
and where little but a vague impression of colour without m
form can be conveyed, the lines of animals are also usually u
to match their surroundings, and no special imitative adap
of form occurs. Thus among the Arctic snows a brown
animal would immediately be perceived, and it defenceless
devoured while as a carnivore it would seldom or never a
unperceived near enough to its prey to effect a capture. H
such variation are at once reproved, and almost all Arctic a
like the American polar hare, are pure white. Elsewhere
black or brown; in the polar region the native species
merit distinguishable from the snow in which they live. Wh
environment undergoes a regular change from season to se
colour of the animals varies with it. The Arctic fox, the com
alpine hare, the ptarmigan, and many other birds, are all
be brown among the brown hillsides of autumn, but snow
among the winter snow. Almost equally conceal is the
colour of desert animals, though the actual hue of bear and fox, i
varies from grain to grain, and nearly all the birds, reptil
insects of Sahara exactly copy the sandy grey hue of th
around them. Snake and other flat-fish (*Pleuronectidæ*)
imitate the colour and speckled appearance of the sand o
they lie. The fish and crustaceans which inhabit the
weed are coloured the same yellowish green as the leaves of alga
they cling. Aphides and many caterpillars (larvæ of moths) feeding
bright green like the new herbage.

Where the environment is somewhat more diverse, there we
begin to show more specialized features. The lion, a large
cat of desert or rocky districts, is uniformly brown, but t
and other jungle cats have perpendicular stripes which ha
with the bamboos and brown grass of their native haunts
the leopard, jaguars, and other forest cats have oval-shaped spo
conceal them among the mingled light and shade of the
Large marine animals have the back black, because the wat
dark when seen from above, but their bellies are white,
harmonize with the colour of the surface when seen from
Dr Wetsmann has shown that most edible unprotected cat
imitate the stripes and lines of the leaves among which th
Those which live upon grass are longitudinally striped
blades, those which live among small leaves are spotted an
so as to resemble the distribution of light and shade in the
and those who live upon large veined leaves with oblique
have oblique lines to harmonize with them. In one cas
the unripe berries are copied for the caterpillar by small
spots. A specialized form of this protective
found in the chameleon, the chameleon bungur many flat-
some mochuan, all of which in very their coloration
that of the surfaces on which they rest. The actions as well
of the animal [illegible]

Where the environment is very varied, as in tropical for
find the greatest variety of colouring, as well as actual m
of particular forms, and the protective resemblances be
once close and most remarkable. Bird, reptile, spider, m
and other active predaceous creatures are constantly hun
insect and mollusc will pass unnoticed amongst the fallen sticks o
and among the coarse vegetation. Each insect only thos
very closely to certain objects in the environment e
escape them. A similar change can be traced from t
coast to the most specialized inhabitants under such circum
Many forest-frequenting birds have a ground tone of green in their p
which occur in the tropics. Some trees
exactly like the leaves on which they sit, other [illegible]

blotches and mildew with which it is [illegible] In
of *Ithomiadæ*, in hiding, the leaf and each insect exactly
forms of imitation very far indeed. Most of them are fai
defenceless creatures, but some, like *Ithomia* closely
green leaves, so as to be almost indistinguishable while
and other exactly imitate short broken twigs of bamb
Wallace found one such in [illegible] *ata*, in

ly overgrown with a creeping moss or jungermannia; and discovered a larval form in Nicaragua whose body was d into thin green filaments, precisely like the moss in t lurked. In other instances the insect probably uses its rather to deceive its prey than to escape its enemies. Sir Hooker believes that an Indian *Mantis* feeds the little which form its food by its mimicry bears to a leaf; Charles Dill head and fangs d into the deceptive appearance of a twig, so that small actually attract stout very few sometimes occur continue to Bate tropical peters themselves to resemble and, as in they prey. Even the Mr from Nicaragua stocked, and from nature perfect the last in the from the natives by a very less the to that one capture object mistaken not particular pro embrace. How allows, produce the white colour of the and the formation in insect and mimicry of *Mantis* Certain *Leaf* the Mr. Bates of the often be which rudely resemble the shape and texture protected of such species the average who all the worse protected species in the and of. Even the and instances of tropical life, it favourable varieties parts mimic observed such parts the and the mimicry may be explained by the to with respect for and so not the other American *Mantis* feeds and therefore very carefully To be not on person has a the middle bird rapidly to attempt on their even attack, put the mimetic the bee prey not a from a larva and flavour them would pass. Suppose to on that on the one hand the bee Mr. Bates and to doubt, the would have even be a fatal protective nobody

the direction of resembling the bees would survive or la eggs in peace. On the other hand, those which actually su would possess great advantages over their neighbours, their larvæ would thus obtain a safe and certain supply and be guaranteed the protection of the bees' nest. In t the flies would at last, by constant survival of the best-a come exactly to imitate the bees amongst which they lived.

The theory of the origin of mimetic forms thus briefly s out is due to Mr Bates and Mr Wallace, and it explains facts more fully than any other. It shows us, first, w mimicking organism always imitates a specially protected secondly, why the two always inhabit the same district; why the mimicking species is always much rarer than the mimicked, fourthly why the phenomenon is confined t groups only; and lastly, why several different mimicking often imitate the one protected form. It also accounts absence of mimetics amongst large or dominant animals, comparative commonness amongst small and defenceless. And by attributing the whole of the phenomena upon the principle of protective colouring it reduces a seemingly and marvellous fact to a particular case of a well-known law.

Whatever theory be adopted, however, the facts and their implication remain the same. For, whether we suppo mimetic resemblance to be due to direct creative desig survival of favourable variations, it is at least clear that the adaptive character is purposive and not acc Here we may draw from the phenomena of mimicry important psychological implication. On the hypoth condition, it is obvious that the mimicry can never go furth the eyes of the species from whom the disguise is advan would naturally arise, and even on the hypothesis of the mutation would be ma more than practical purposes of de There is much evidence in favour of this view. Mr. B. T for example, who has carefully measured the curvature of th in the compound eyes of insects upon which depends the m best approach to this object, find that the mimicry in the the flies parallels upon bees as it has proceeded just so fa true eye of the bee we should be led to expect, and no furth other words, to take a measurement of angular distance su can conclude that a fly seems to be absolutely indistinguis a bee from one of his own species within the limits of v sion. The picture cast upon the sensorium by the fly another bee are simply identical. In many other cases it is known that the mimicry seems specially intended to dec eyes of a particular class of animal, while there is no mimicry where the only enemies or prey consist of plants o animals. Naturally there can be no mimicry without a re deceive the very conception implies an external nervous organ acted upon, and to be acted upon deceptively. Thus plants must have reference to the eyes of animals, m resemble to the eyes of one another. We may conclude, then, that if a leaf insect is green with faint violet-brow and white specks like a certain leaf, in order to deceive , then these birds are capable of perceiving th imitated to that particular degree. So the pre arrangement may guide us to a rough idea of the pe power of those creatures whom the mimicry serves to deceiv

[illegible] of sand and coloured pebbles in the flat [illegible] indication that the predaceous fish by whose [illegible] have been developed through the weeding out of all p variations can pretty accurately distinguish form and colou long green pipe fish which cling around green sea-we probably acquired their existing hues to deceive the eyes the *Hippocampus equus*, a hippocampus which lo [illegible] a piece of tangled and waving fucus (see figure, [illegible] has doubtless in the same way taken on its delus ne to the algæ among which it lives. So the cricke resemble its foe the sand wasp must have gained its shape and hue by deceiving its enemy, and therefore gest the probability of highly developed vision on the every reason to believe that i instances insect species and even lizards have developed or other deceptive resemblances in order to delude the eye sects, while in other cases the disguise has been uncon adopted to deceive fish, amphibians, reptiles, birds, and m Moreover we have some grounds for believing that the colour is exceptionally strong in birds and in one or tw orders; and the mimicry of colour seems to have proceede greatest length amongst animals which are most exposed attacks of these classes, or which would find it advanta deceive them. It may be added that these same classes h most effective in producing the bright hues of flowers and f Mr Darwin's hypothesis, or are at least in any case most in correlated with such vegetable structures as fertilizers of and dispersers of seed. Mimicry is thus to some extent gauge of the perceptive faculties of the species deceived by

vocal mimicry which occurs among certain birds, such as king-bird, starling, parrot, and bullfinch, must of course be n a wholly different category from these biological cases It ct volitional result, and it is mimicry in a literal not in a ve sense. The faculty seems to be due to the play-instinct nd not to subserve any directly useful function (G. A.)

MNERMUS, a Greek elegiac poet, born at Smyrna, bout 600 B.C. His life fell in the troubled time the old Greek city of Smyrna was struggling to in itself against the rising power of the Lydian One of the extant fragments of his poems refers struggle and contrasts the present effeminacy of his ymen with the bravery of those who had once d the Lydian king Gyges. The poet mention in r fragment that he belonged to the stock of the onians who had seized the Æolic Smyrna. But his mportant poems were a set of elegiac addressed to a ayer named Nanno; they were collected in two books after her name. Hermesianax mentions her love for , and implies that it was unfortunate. Only a few nts of these poems have been preserved, and their elancholy tone and delicate language give some idea poet's character. His ideal is the sweet soft us Ionian life, and he would enjoy it free from and die as soon as he could no longer enjoy it re is apparent some of the old stronger strain of er which in early time raised the Ionian cities to ss, pride in the glories of his race and scorn for hat are unworthy of their fathers' renown. His nce of life was evidently sad; he felt that his was gradually yielding to the enemy it had once d, and he knew that his own hopes were cheap l. The sun himself has endless toils from rising to and again from setting to rising. The life of man nsitory as the leaves of spring, he says, referring to ge in the popular epic poetry of Ionia (*Iliad*, vi. He wishes to die in his sixtieth year, a wish to Solon replied bidding him reconsider and rather die when he was eighty years old. Mimnermus e first to make the elegiac verse, which had pre- had more of the epic character, the vehicle for love and to impart to it the colour of his own mind. nd the elegy devoted to objective themes; he made ective. He set his own poems to the music of the nd the poet Hipponax says that he used the melan ρόμος Κραδίας. He bears the epithet Λυγαστίδης, ch Solon addresses him. It is doubtful whether thet is peculiar to himself or whether it marks him nging to a musical and poetic family or school; it ently akin to the epithet λιγεῖαι Μοῦσαι.

OSA. The *Mimoseæ* (so named from their mimicry al movements) form one of the three suborders of *mosæ*, and are characterized by their (usually small) flowers and valvate corolla. Their 28 genera and pecies are arranged by Baillon in four series, of he acacias (see ACACIA) and the true mimosas are ost important. They are distributed throughout all tropical and subtropical regions, the acacias derating in Australia and the true mimosas in a. The former are of considerable importance as of timber, gum, and tannin, but the latter are of ess economic value, though a few, like the talh (*M. nea*) of Arabia and Central Africa, are important Most are herbs or undershrubs, but some South- an species are tall woody climbers. They are often . The roots of some Brazilian species are poisonous, t of *M. pudica*, L., has irritating properties. *M.* a has been used in America in the treatment of &c., probably as an astringent. The mimosas, r, owe their interest and their extensive culti- partly to the beauty of their usually bipinnate foliage, but still more to the remarkable devel in some species of the sleep movements manife some extent by most of the pinnate *Leguminosæ*, as many other (especially seedling) plants. In the s "sensitive plants" these movements not only tak under the influence of light and darkness, but can b excited by mechanical and other stimuli. When lated, say at the axis of one of the secondary petio leaflets move upwards on each side until they m movement being propagated centripetally. It ma be communicated to the leaflets of the other sec petioles, which close (the petioles, too, converging thence to the main petiole, which sinks rapidly dow towards the stem, the bending taking place at the pu or swollen base of the leaf-talk. See BOTANY, p. 113, fig. 117. When shaken in any way, the close and droop simultaneously, but if the agita continued, they reopen as if they had become toned to the shocks. The common sensitive p hot house is *M. pudica*, L., a native of tropical A but now naturalized in corresponding latitudes of A Africa, but the hardly distinguishable *M. sensiti* others are also cultivated. The common wild s plants of the United States are two species of the allied genus *Schrankia*.

MINDANAO, MINDORO. See PHILIPPINE I-

MINDEN, the chief town of a district of the sam in Prussia, province of Westphalia, is situated ab miles to the west-south-west of Hanover, on the le of the Weser, which is spanned there by two bridges older parts of the town retain an old-fashioned appe with narrow and crooked streets, the modern s occupy the site of the former fortifications. Th interesting building is the Roman Catholic cathed tower of which, dating from the 11th century, illu the first step in the growth of the Gothic spire in Ge The nave was erected at the end of the 13th centu the choir in 1377–79. Among the other chief edif the old church of St Martin, the town-house, Gothic façade; the extensive court-house; and the G ment offices, constructed, like many of the other bu of a peculiar veined brown sandstone found in the Minden contains a gymnasium and several hospitals other charitable institutions. Its industries includ and cotton weaving, dyeing, calico printing, an manufacture of tobacco, leather, lamps, chicory, and cals. There is also some activity in the building craft. In 1881 197 vessels of an aggregate bur 12,569 tons entered and cleared the river-harb Minden. The population in 1880 was 17,869.

Minden (*Mindun*, *Minde*), apparently a trading place importance in the time of Charlemagne, was made the seat of by that monarch and subsequently became a flourishing of the Hanseatic League. In the 13th century it was sur with a wall. Punished by military occupation and a fine reception of the Reformation in 1547. Minden underwent trials in the Thirty Years' War and the wars of the French tion. In 1648 the bishopric was converted into a secular prin under the elector of Brandenburg. From 1807 to 1814 was included in the kingdom of Westphalia, and in the l it passed to Prussia. In 1816 the fortifications, which l raised by Frederick the Great after the Seven Years' W restored and strengthened, and as a fortress of the second remained the chief military place of Westphalia down t when the works were finally demolished. At Todtenha miles to the north of Minden, the allied English and Germa under the duke of Brunswick gained a decisive victory o French in 1759. About 3 miles to the south of Minde so-called "Porta Westfalica," a narrow and picturesque which the Weser quits the mountains and reaches the plain

Minden is not to be confounded with the Hanoverian M also sometimes written Minden (population 6355), at the co (*Mündung*) of the Werra and Fulda.

MINE. See MINING.

MINERALOGY

NATURAL objects which are homogeneous in their ma , and in which no part formed for special pu poses can be distinguished, are termed "minerals"; and the branch of natural s ce which treats of these is termed mineralogy. Mi differ from the structures treated of in botany and z y in the three following pa ticulars. (1) They differ in mode of their formation; his has been accomplished by a simulation of matter, produced growth not, as but by augmentation of bulk through accretion from without. (2) Minerals are not heterogeneous. While the objects treated of in the other department of natural history consist of beings composed of life, and having parts which, being mutually dependent, cease to be separated from one another without more or less complete destruction of the individual, the objects treated of under the department of mineralogy are commonly constituted an individuality that they are not destroyed by any operation of part , each portion or fragment possessing the same properties and the same composition as the whole. And (3), while those beings which are possessed of life have their component elements grouped into complexes, for the most part capable of more or less freedom of motion and susceptible of change, minerals have a constitution resulting from chemical attractions alone and an arrangement of their parts under physical influences, which has resulted in rigidity and an absence of all tendency to change.

Form of Minerals—Crystallography

The most precise definition of a mineral would be an inorganic body possessed of a definite chemical composition, and usually of a regular geometric form. Of these, the second is in one respect the direct outcome of the first; while many of the most important physical properties possessed by minerals are outcomes of the second.

Both the geometric form and the composition of minerals are produced and modified under the influence of general laws.

Mineral bodies occur in the three physical conditions of solid, liquid, and gas. Those now found in the last two states are few in number, and are of altogether inferior interest to those which occur as solids, but there is reason to

mineral s we know solid the liquid or gaseous state, and that their pre ence was determined in the process of solidifica tion. Those formed may be divided into two

nite geometrical form. These (wh ch are by far every portion (except when under equally easy or equally diffi cult to break when broken they exhibit conchoidal surfaces, they are equally hard throughout all their y are equally elastic in all directions; they conduct with equal rapidity and to equal amount in all di

2. Crystalline bodies, which occur in definite geometrical forms bounded by These present greater facilities of separation of their particles, or "cleavage," in certain directions lying in determinate planes than they do in others; most of them are neither equally hard or equally elastic in all directions, conduct heat more rapidly in certain directions than they do in others, and, when transparent, refract light doubly except in certain directions.

Mineral bodies are found in both of the above classes; and the same mineral body may occur in both the amorphous and the crystalline condition. This is seen in the piece of gold shown in fig. 1, where the upper portion has a sharply angular and a well-defined shape, while the lower presents curvilinear and merged outlines, similar to one another in no part. Under favouring circumstances, it is possible that every substance whose composition is capable of being represented by a definite chemical formula (i.e., which has an unvarying composition) may be capable of assuming a definite crystalline form.

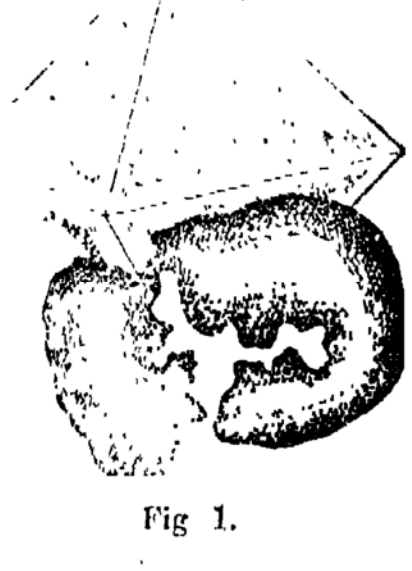

Fig. 1.

Size and Form of Crystals.—They are of every size from over a yard in diameter to mere specks requiring a high power of the microscope to reveal their existence. Beryls have been obtained in America more than 4 feet in length by 2½ in thickness, weighing 2½ tons. Equally large crystals of apatite have been found in Canada. There is a rock crystal at Milan 3½ feet long by 5½ in circumference, weighing 870 lb. The highest perfection of form, and hence of other properties, is only found, however, in crystals of moderate or of small size.

Size of crystals

Variety of Form, and Constancy of Form.—The same mineral may be found in different localities, or sometimes in the same locality, exhibiting an almost endless variety of forms. Calc-spar occurs at a Scottish locality in acicular pyramidal crystals of which the length may be ten or more times as great as the width (fig. 2); in flat plates as thin as paper, in which the length is not the hundredth part of the width; also in prisms, pyramids, and rhombohedra, which at first sight (as in figs. 3, 4) seem

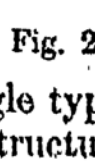

Fig. 2.

Fig. 4

destitute of any relationship to each other. This substance has elsewhere been noted in several hundred forms. The minerals fluorite, pyrite, and baryte have each been observed in over a hundred diverse forms. Nevertheless, however great the number, all the forms, in the case of each mineral, may be reduced or referred to a single type, by the simple process of examining its internal structure or the mode of arrangement of its molecules. This is

Variety of form

Relation

accomplished in two ways—(1) by finding the weak joints in that arrangement, through splitting the crystal, and (2) by measuring the angular inclination of the outside surfaces which bound the form and, from these measurements, by simple mathematical laws, arriving at what has been termed its "primitive" or simplest form.

As regards the mere recognition of a substance, such measurement in itself suffices, the angular inclination, if the same surfaces be measured, being unvarying in each species. It can, moreover, be shown that the possible range of external variety of form is governed by fixed mathematical laws, which determine precisely what crystalline forms are or may be produced for each species. Comparatively few of these actually occur in nature, but crystallographic laws can point out the nature of those which can possibly occur, can delineate them even before they are found, and can in all cases show the relation by which subsists between them and the simplest fundamental form from which or out of which they all [illegible] nate. It must be observed that in crystalline bodies [illegible] referral structure—that is, the arrangement of the [illegible] is as regular in an outwardly shapeless [illegible] to the modelled crystal which presents itself as a perfect [illegible].

Definitions of Crystals, and their Parts.—A crystal is a symmetrical solid, either opaque or transparent, contained within surfaces which theoretically are of a perfect polish, but which are actually frequently curved, striated, or pitted. These surfaces are called "planes," or "faces." The external planes of a crystal are called its "natural planes," the flat surfaces obtained by splitting a crystal are called its "cleavage planes." The intersections of the bounding planes are called "edges," and planes are said to be similar when their corresponding edges are proportional and their corresponding angles equal. Crystals bounded by equal and similar faces are termed "simple forms." The cube, bounded by six equal squares, the octahedron, bounded by eight equilateral triangles, and the rhombohedron, bounded by six equal rhombs, are thus simple forms. Crystals of which the faces are not all equal and similar are termed compound forms, or "combinations," being regarded as produced by the union or combination of two or more simple forms. Edges are termed rectangular, obtuse, or acute, according as the angle at which the faces which form the edge meet is equal to, or greater or less than, a right angle. Edges are similar when the planes by the intersection of which they are formed are respectively equal and equally inclined to one another; otherwise they are unlike or dissimilar.

When a figure is bounded by only one set of planes, it is said to be "developed." When an edge is cut off by a new plane, it is said to be "replaced"; when cut off by a plane which forms an equal angle with each of the original faces which formed the edge, it is said to be "truncated." When an edge is cut off by two new faces equally inclined to the two original faces respectively, it is said to be "bevelled." When a solid angle is cut off by a new face which forms equal angles with all the faces which went to form the solid angle, it is said to be truncated.

In classifying crystals and studying their properties, it is found convenient to introduce certain imaginary lines called "axes." Axes are imaginary lines connecting points in the crystal which are diametrically opposite,—such as the centres of opposite faces, the apices of opposite solid angles, the centres of opposite edges. Different sets of axes may thus be drawn through the same crystal, but there is always one set, usually of three, but in one special class of crystals of four, axes, by reference to which the geometrical and physical properties of a crystal can be most simply explained. These axes intersect one another, either at right angles, producing "orthometric" forms, or at oblique angles, producing "clinometric" forms. The axes may be all equal, or only two equal, or all unequal.

There is a definite conventional position in which for purposes of description a crystal is always supposed to be held. With reference to this position one of the axes, that which is erect or most erect, is termed the "vertical," and the others the "lateral." The planes in which any two of the axes lie are called the "axial" or "diametral planes," sometimes "sections." By these the space around the centre is divided into "sectants." If there are, as is generally the case, only two lateral axes, the space is divided into eight sectants, or octants; but if there are three lateral axes, it is divided into twelve sectants.

Primitive Forms of Crystals.—If we attempt to arrive through a study of the internal structure of crystals, as evidenced by directions of weakness of cohesion, at the total number of primitive or parent forms which can exist, we find that there are thirteen such forms and no more.

Some of these may be regarded as prisms standing upon a triangle as one of their bases, some as standing upon a square, and some as standing upon a hexagon, or six-sided figure, while one, or at most two, of them may be regarded as standing upon a rhombus. Of the forms which have a four-sided base, [illegible] the lateral planes are at right angles to the base, that is, if the lateral planes are called planes perpendicular to the base, the form is termed a "right square prism" (fig. 6). If the four lateral planes are not rectangular and equal, they may be those of a square, or of the latter case the form is the "right rectangular prism" (fig. 7). In each of

Fig. 5.

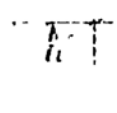

Fig. 7.

above three forms [illegible] edges are two in number. In the all the edges are [illegible]. In the square prism the lateral are all equal but [illegible] different from the two equal edges of base. In the rectangular prism two of each base differ in length from the other two, while both differ from the lateral; but there are here three sets of edges, four in each. In each of the three forms, however, the solid angles are eight in number, equal, and each enclosed by three right angles.

When the [illegible] rhombus, and the prism is not erect, the form is a "right rhombic prism" (fig. 8). Two of the angles in the lateral faces being here acute and two obtuse, two of the solid angles corresponding each with each in number differ from the other two of the latter, which are equal. The four lateral edges are equal.

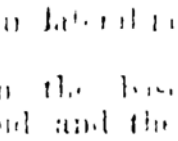

Fig. 8.

When the base is a rhomboid and the prism is not erect, it is only the opposite lateral faces that are equal. The form is called a "rhomboidal prism" (fig. 9).

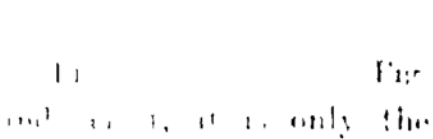

Fig. 9.

When the lateral edges [illegible] its base, the form is called a "right rhombic prism" (fig. 10). Here the lateral planes are all equal in length, but only the opposite ones are equal in breadth. The angles which the lateral edges make with the base are two acute and two obtuse.

Fig. 10.

Fig. 11.

Fig. 12.

If all the edges of an oblique rhombic prism are equal in length to the breadth of the base, and if the lateral planes are rhombs equal in all respects to the basal, the form is called a "rhombohedron" (fig. 11). This is included within six equal planes,

he cube, but these planes have oblique angles. The rhombo-
hedron thus bears the same relation to the oblique rhombic prism
which the cube does to the right square prism. Of the eight solid
angles of a rhombohedron only two are contained by three equal
plane angles, and these two "apices," as they may be called, are
opposite one another. According as the apices are acute or obtuse,
ve have an acute or obtuse rhombohedron.

When the base of an oblique prism is a rhomboid, the prism
becomes an "oblique rhombordal prism" (fig. 12). In this form,
only the small opposite edges are equal, as regards equality
of length and the value of the inclined faces. Only opposite solid
angles are equal, as are also the opposite and parallel faces.

A right prism may have an equiangular six-sided base, it is then
called an "hexagonal prism." This form may be developed in two
positions relatively to the base: one in which the front vertical edges
pass from the centre of the base (fig. 13) the other in which
they pass from the centre of
opposite sides of the base
(fig. 14). The faces of the first
naturally form a cube, and
the second a rhombohedron
both of which forms are
found upon crystals. The
other hexagonal prism
(fig. 15) is the rhombohedron.
Like the first of the other hexagonal prisms, the
lateral edges are of unequal length. Hexagonal
prisms of the width of their base
(fig. 16). The prism here on the left

Fig. 13. Fig. 14

is bounded by twelve faces, which are isosceles triangles, the equal sides being
the lateral edges of the planes. These basal edges are equal and
similar, but differ in length and in angle from
the eight equal pyramidal edges. When the
axes of the prism is a rhombus, it is called
a "rhombic hexagonal prism" (fig. 17).

Octahedra.—The octahedron has each of its
twelve edges equal. It is, like the cube
and the rhombohedron, a solid which is symmetrical.
The inclined edges are all 120°, the plane
angles are 109° 28′ 16″ and 70° 31′ 44″. The edges
are twenty-four, and the faces eight. There are fourteen
solid angles, of which six are formed each by the meeting of four
acute plane angles, and eight by the meeting of three obtuse plane
angles.

Fig. 15. Fig. 16 Fig. 17

Fig. 18.

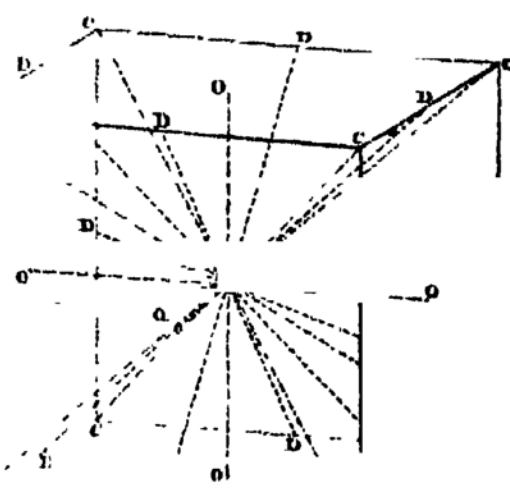
It has been said that the above simple forms were arrived
at through a study of the internal structure of crystals,
chiefly as disclosed by cleavage. Inasmuch, however, as
there are some minerals which cleave in only one direction,
and many which cannot be cleaved in any direction, this
method of investigation fails. Its employment, moreover,
frequently led to conflicting or embarrassing results. A
conflicting result is when a substance has more than one
set of cleavages,—that is, splits up in directions which
could result in the production of more than one of the
above primary or simple forms. Thus the mineral fluorite
occurs with much the greatest frequency in the form of
the cube, and it might very consistently be held that its
frequent occurrence in this form was a clear natural
indication that the cube was the primary or simplest form
of fluorite; but it splits up into an octahedron. Galena
crystallizes frequently in the form of the octahedron; yet
to cleavage galena yields a cubic primary form. It might
be conceived that there had been, in each case, some
special tendency to assume the cubic form and the octa-
hedral form, but one and the same piece of rock may
bear on its surface cubic crystals of fluor and octahedral
crystals of galena, each of the minerals having here
assumed the primitive cleavage form of the other in pre-
ference to its own. The mineral blende crystallizes not
unfrequently in octahedra, which yield the dodecahedron
on cleavage. Fluor crystallizes in dodecahedra, yet yields
the octahedron to cleavage. Argyrite crystallizes in cubes
and in octahedra, but yields the dodecahedron on cleavage.
Pyrite crystallizes in cubes, octahedra, and dodecahedra,
and yields both the cube and the octahedron on cleavage.

These are most embarrassing results, but they clearly
indicate so intimate a relationship to subsist between three
of the above simple forms that it is obvious that one alone
would serve as a type form for representing the others.
The selection of that one should be based upon grounds of
most eminent simplicity, and this again is to be arrived
at by a consideration of the smallness of number of parts
viz., of faces, edges, and solid angles. In such a considera-
tion we find that the dodecahedron, with its higher number
of each of these, at once gives place. The cube has six
faces, the octahedron eight; simplicity here is in favour of
the cube. The cube has twelve edges, the octahedron has
twelve, in this respect they are equal. The cube has
eight solid angles, the octahedron six; here the greater
simplicity is on the side of the octahedron. So that this
method of adjudicating by simplicity fails, and we are
thrown back upon the relationships which may be unfolded
through a consideration of the other elements of crystals,—
their axes.

Systems of Crystals and Laws of Crystallization.

This consideration led, first, to the remarkable discovery
that several of the above primary forms are mere modifica-
tions of each other, and ultimately showed that all crystals
found in nature may be referred to six systems, based on
certain relations of their axes, and that every face which
could occur upon a crystal bears a definite and simple
relation, in position and in angular inclination, to these
axes.

As regards mere geometric measurement, there are several direc-
tions in which axes may with nearly equal advantage be projected.
For example, in the cube
axes may be drawn
from the centres of opposite
faces, as lettered O; or
from opposite solid angles,
as lettered C; or from the
centres of opposite edges,
as lettered D. There is
abundance of evidence that
each of these directions
must be regarded as lines
of dominant accretion of
molecules.



But the accretion may be
not only dominant but
overwhelmingly so in one
only of these directions in
certain cases, or existent
along one set of axes alone
in certain others. In a specimen of native silver from Alva in
Scotland (fig. 20), along O this is so much the case that the con-
creting molecules have done little more than delineate the form
of an octahedron, and this they have only been able to do by

departure in regard the angular inclination.

the rhombic system none of the axes are
t all still meet at right angles. Here is total
egularity in that particular, but still none in
nd

the oblique prismatic system none of the axes are
and only two intersect at right angles. Here there
a total lack of uniformity in the first particular, and
mount of departure from it in the second

the anorthic system none of the axes are equal,
of them intersect at right angles — so that here,
as expressed by the name, there is
a total departure from regularity in
both particulars.

6. The hexagonal system is
an anomaly in relation to this mode
of consideration. It is regarded as
having four axes, three of which lie
in one plane, parallel to the base, and
intersect each other at equal angles

ll be convenient, before proceeding to the considera-
the laws of crystallography and the combinations
of forms,—especially in view of the terminology that must be employed in illustrating those general aspects of the subject,—to give an outline of one of the six systems here. For this preliminary description the cubic system, as the simplest and most regular, naturally suggests itself as the most suitable.

1. *The Cubic System.*—Here the axes are all equal, and all intersect at right angles. The "cube" (fig. 26), "octahedron" (fig. 30), and "rhombic dodecahedron" (fig. 33), which are here included, are alike in their perfect symmetry; the height, length, and breadth are equal; and their axes are equal, and are rectangular in their intersection. Cubic system.

In the cube (fig. 5) these axes connect the centres of opposite faces, in the octahedron (fig. 15) the apices of opposite solid angles, in the dodecahedron (fig. 18) the apices of opposite acute solid angles. The relation of these forms to each other, and the correspondence in their axes, will be made manifest through a consideration of the transition between the forms. If a cube be projected with the axes in the above position, or if a model of it in any ductile material be employed, and if the eight angles are sliced off evenly, keeping the planes thus formed equally inclined to the original faces, we first obtain the form in fig. 27, then that in fig. 28 and fig. 29, and finally a regular octahedron (fig. 30); and the last, disappearing point of each face of the cube is the apex of each solid angle of the octahedron. Hence the axes of the former, being in no way displaced, necessarily connect the apices of the solid angles of the latter. By cutting off as evenly the twelve edges of another cube, the knife being equally inclined to the faces, we have the form in fig. 31, then fig. 32, and finally the rhombic dodecahedron (fig. 33), with the axes of the cube connecting the acute angles of the new form. These forms are thus mutually derivable. Moreover, they are often presented by the same mineral species, as is exemplified in galena, pyrites, and the diamond. Relation of simple forms.

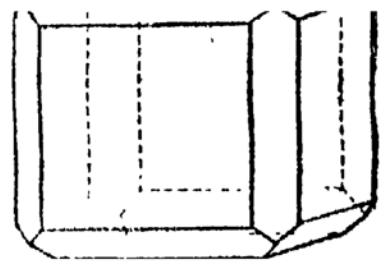

Fig. 31.

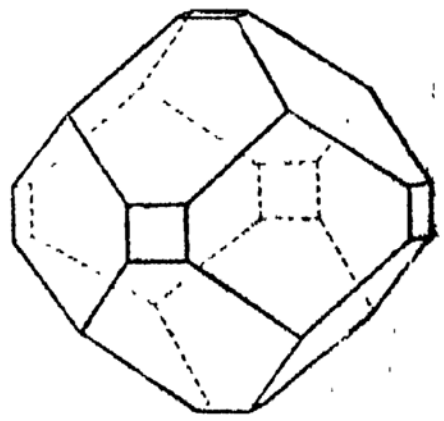

Fig. 32.

The process may be reversed, and the cube made from the octahedron, as will be readily understood from a comparison, in reverse order, of figs. 26 to 30. Or the cube may be similarly derived from the dodecahedron, as seen by inspecting figs. 33, 32, 31, 26.

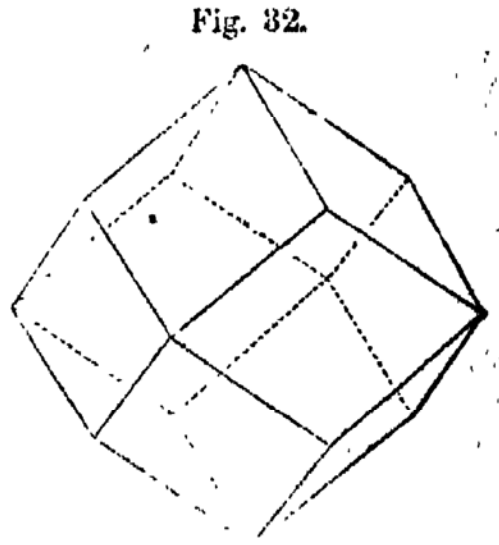

Fig. 33.

The octahedron also is changed to a rhombic dodecahedron by removing its twelve edges (figs. 31, 35), and continuing the removal till the original faces are obliterated, thus producing the dodecahedron.

It will be observed that throughout all these changes the position of the axes, as determinants of dimensions, need not be altered, that, in fact, one set of axes has served for all the forms.

The relationships of the principal forms of this system being thus disclosed, the forms themselves have next to be considered.

The cube (fig. 26) is bounded by six equal squares, has twelve edges formed by faces meeting at 90°, and eight solid trigonal angles. The axes are taken as joining the centres of each two opposite faces. Examples are halite, galena, and fluor.

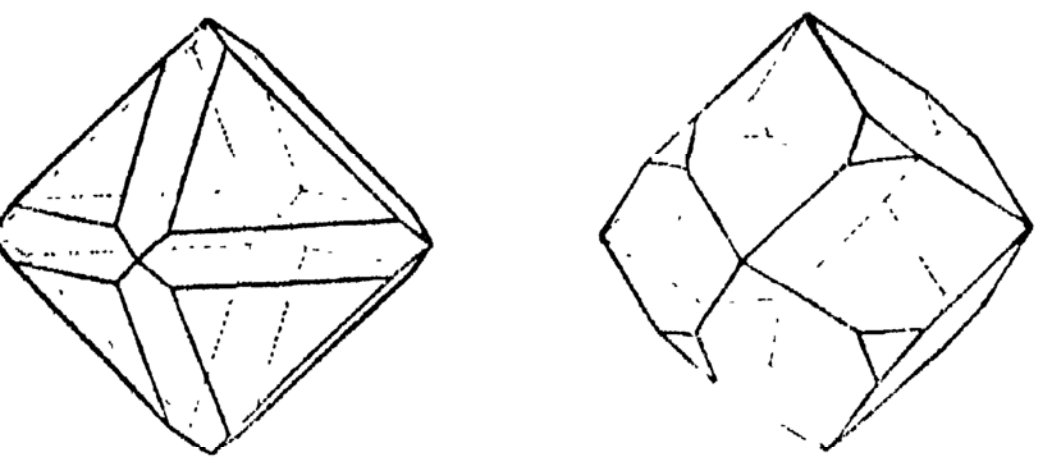

Fig. 34.

The octahedron (fig. 30), bounded by eight equilateral triangles, has twelve equal edges with planes meeting at 109° 28′ 16″, and six tetragonal angles. The principal axes join the opposite solid angles. Examples: magnetite, gold, cuprite.

The rhombic dodecahedron (fig. 33) is bounded by twelve equal and similar rhombi, has twenty four equal edges of 120°, and has six tetragonal and eight trigonal angles. Each of the principal axes joins two opposite tetragonal angles. Examples: garnet, cuprite, blende.

The tetrakishexahedrons (figs. 36, 37, 38, varieties of icositetrahedron) are bounded by twenty four isosceles triangles, placed so as to form four sided pyramids on the faces of the cube, arranged in six groups of four each. They have twelve longer edges, which correspond to those of the primitive or inscribed cube, and twenty-four shorter edges placed over each of its faces. The angles are eight hexagonal and six tetragonal, the latter joined two and two by the principal axes. Examples: fluorite, gold. This form varies much in general aspect. The four-sided pyramid which rests on the edges of each face of the cube may be so low as almost to fall into it (fig. 36); or it may rise so high that each side forms a level surface with that which is adjacent to it upon the nearest cubic face (fig. 38). In the latter case the form has become the rhombic dodecahedron; so that the more or less acute varieties of the form are but stages of a passage of the cube into the latter figure, through an increasing accretion of matter in the lines of the axes of the cube. This is termed a "transition by increment."

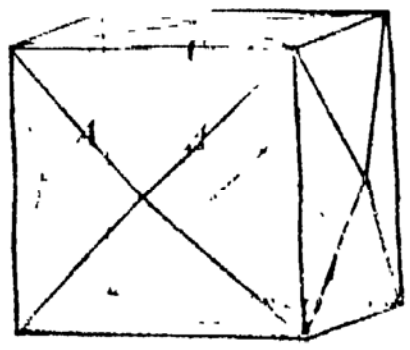

Fig. 36.

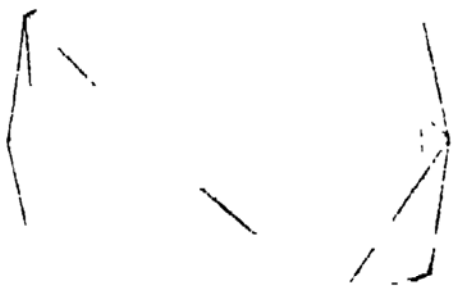

Fig.

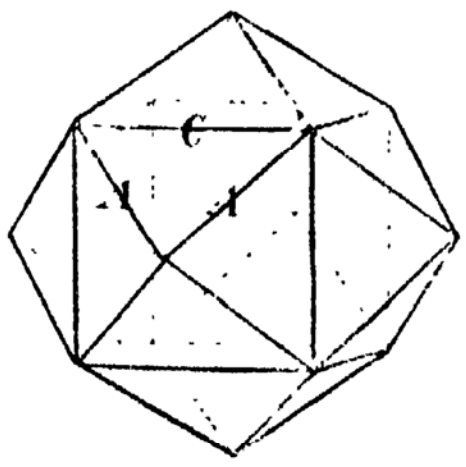

Fig. 38.

The triakisoctahedrons, fig. 39 (variety of icositetrahedron, fig. 40), are bounded by twenty-four isosceles triangles, in eight groups of three, arranged as pyramids on the edges of the faces of the octahedron. Like the previous form they vary in general aspect, the variation here being from the octahedron on one side to the rhombic dodecahedron on the other; while the increased accretion here is in the direction of lines joining the centres of the faces of the octahedron or the solid angles of the cube. The passage of the forms is similar to that illustrated in the last-con

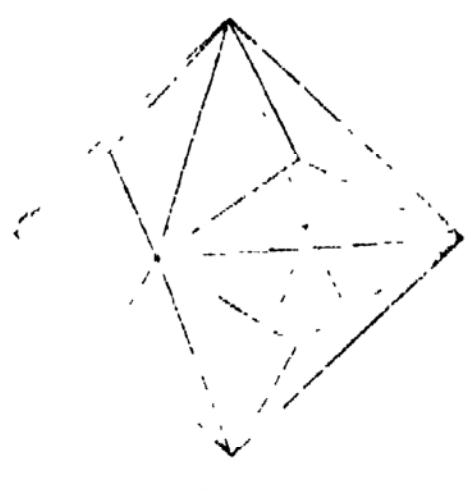

Fig. 40.

sidered form. The edges are twelve longer, corresponding with those of the inscribed octahedron, and twenty four shorter, three and three over each of the faces. The angles are eight trigonal and six tetragonal (formed by eight faces), the latter each joined two and two by the principal axes. Examples: galena, diamond.

The icositetrahedron (fig. 40) are bounded by twenty four deltoids. This form varies from the octahedron to the cube, sometimes approaching the former and sometimes the latter in general aspect. A four sided pyramid rests on the angles of the faces of the cube. When increased accretion takes place along the cubic axes, an octahedron results. When it is along lines joining the solid angles of the cube, that form itself results. The edges are twenty four longer and twenty four shorter. The solid angles are six tetragonal joined by the principal axes, eight trigonal and twelve rhombic or tetragonal with unequal angles. Examples: analcime, garnet.

The hexakisoctahedrons (fig. 41), bounded by forty eight scalene triangles, vary much in general aspect, approaching more or less to all the preceding forms, into all of which they may pass; but most frequently they have the faces arranged either in six groups of eight on the faces of the cube, or eight of six on the faces of the octahedron, or twelve of four on the faces of the dodecahedron. There are twenty four long edges, often corresponding to those of the rhombic dodecahedron or bisecting the long diagonal of the trapezohedron, twenty four intermediate edges lying in pairs over each edge of the inscribed octahedron, and twenty four short edges in pairs over the edges of the inscribed cube. There are six ditetragonal angles joined by the principal axes, eight hexagonal, and twelve rhombic angles. Examples: diamond, fluorite.

Fig. 41.

General Laws of Crystallography. — The seven forms of crystals now described are related to each other in the most intimate manner. This will appear more distinctly from the account which is to follow of the mode of derivation of the forms, with which is conjoined an explanation of the crystallographic signs or symbols by which they are designated. These symbols were introduced by Naumann, in the belief that they not only mark the forms in a greatly abbreviated manner, but also exhibit the relations of the forms and combinations in a way which words could hardly accomplish. In order to follow out this

erivation of forms, it is necessary to state briefly the ollowing laws, which have been established in crystallo raphy. It is to be remembered that these laws apply, ot merely to the cubic system just described, but to all he systems.

1. *The Law of the Invariability of the Angles of Crystals*, which was established by Romé de l'Isle, may be thus tated: the angle of inclination of the faces of a crystal are constant, however unequally the faces may be developed. The corresponding angles of different crystalline specimens of the same body do not, however, always absolutely accord. Differences have been found, amounting sometimes even o 10°.

2. *The Law of Symmetry*, discovered by Haüy, may be thus expressed: (1) similar parts of crystals, faces, edges, angles, and consequently axes, are all modified in the same manner, and dissimilar parts are modified separately or differently, (2) the modifications produce the same effect on the faces or edges which form the modified part, when they are equal; when they are not equal, they produce a different effect. That is, if an edge be truncated or bevelled, every similar edge will be similarly truncated or bevelled; if an angle be truncated or acuminated, every similar angle will be similarly truncated or acuminated; and consequently every similar axis will be equally affected by the modifications. Thus the cube has eight similar angles and twelve similar edges. In the physical production of the cube, if one of the angles or edges be modified, all will be similarly modified. This, which is the most important law of crystallography, is, however, subject to an exception which was fully formulated by Weiss. The law was: all the similar parts of crystals, faces, edges, angles, and consequently axes, are modified at the same time and in the same manner; the forms resulting from this law are termed "holohedral." The exception is that half of them or one fourth of them only may be similarly modified. When only half of the similar part are modified, we get the "hemihedral" forms; when one-fourth only are modified, which occurs only rarely, we get "tetartohedral" forms.

3. *The Law of the Parallelism of the Faces of a Crystal*, discovered by Romé de l'Isle, may be expressed as follows: every face of a crystal has a similar face parallel to it; or every figure is bounded by pairs of parallel faces (with the exception of certain hemihedral forms).

4. *The Law of Zones*, first established by Weiss, may be thus enunciated: the lines in which several faces of a crystal intersect each other (or would do so if they were produced until they met) frequently form a system of parallels. Such a series of faces is termed a "zone." Sometimes the zones are parallel to one of the symmetrical axes. Thus, in every prism, the faces of the prism constitute a zone which encircles the axis of the prism. Faces may belong to a zone although they do not actually intersect on the form.

5. *The Law of the Rationality of the Parameters* of the faces of crystalline forms, first indicated by Malus, is that the position of planes may be assigned by numbers bearing some simple relation to the relative lengths of the axes of the crystal. This law was the outcome of investigations into the relation hitherto glanced at in commencing the consideration of the cubic system, and was arrived at through the study of the mode of derivation of forms.

The derivation of forms is that process by which from one form chosen for the purpose (generally one of the type), the fundamental or primary form, all the other forms of a system may be produced, according to fixed principles or general laws. In order to understand this process or method of derivation, it must be noted that the position of any plane is fixed when the position of any three points in it, not all in one straight line, is known. To determine the position, therefore, of the face of a crystal, it is only necessary to know the distance of three points in it from the centre of the crystal, which is the point in which the axes intersect each other. As the planes of all crystals are referred to their axes, the points in which the face (or its supposed extension) meets the three axes of the crystal are chosen, and the portions of the axes between these points and the centre are named parameters of the face; and the position of the face is sufficiently known when the relative length or proportion of these parameters is ascertained. When the position of one face of a simple form is thus fixed or described, all the other faces of the form are in like manner fixed in accordance with law 2, since they are all equal and similar, and have equal parameters—that is, intersect the axis in the same proportions. Hence the expression which marks or describes one face marks and describes the whole figure, with all its faces.

The octahedron is adopted as the primary or fundamental form of the cubic system, and distinguished by the first letter of the name, O. If the faces cut the half-axes at equal distances from the centre—that is, if these semiaxes, the parameters of the faces, have to each other the proportion 1 : 1 : 1. In order to derive the other forms from the octahedron, the following construction is employed.

Suppose a plane to be laid down perpendicular to one axis, and consequently parallel to the two other axes (or to cut them at an infinite or infinite expressed by ∞, the sign of infinity): then the hexahedron or cube is produced, designated by the crystallographic sign $\infty O\infty$, expressing the proportion of the parameters of its faces, or $\infty : \infty : \infty$. If a plane is supposed placed on each edge parallel to one axis, and cutting the two other axes at equal distances, there results the rhombic dodecahedron, designated by the sign ∞O, the proportion of the parameters of its faces being $\infty : 1 : 1$. The trisoctahedron arises when, on each edge of the octahedron, planes are placed cutting the axis not belonging to that edge at a distance from the centre m, which is a rational number greater than 1. The proportion of its parameters is therefore $m : 1 : 1$, and its sign mO, the most common varieties are $\frac{3}{2}O$, $2O$, and $3O$, seen in diamond and fluorite. When, on the other hand, from a similar distance m in each two semiaxes prolonged a plane is drawn to the other semiaxis, or to each angle, an icositetrahedron is formed; the parameters of its faces have consequently the proportion $m : m : 1$, and its sign is mOn; the most common varieties are $2O2$ and $3O3$, the former very frequent in leucite, analcime, and garnet, the latter in gold and amalgam. When, again, planes are drawn from each angle, or the end of one semiaxis of the octahedron, parallel to a second axis, and cutting the third at a distance n greater than 1, then the tetrakishexahedron is formed; the parameters of its faces are $\infty : \infty : n$; its sign is ∞On; and the most common varieties in nature are $\infty O\frac{3}{2}$, $\infty O2$, and $\infty O3$. Finally, if in each semiaxis of the octahedron two distances m and n be taken each greater than 1, and m also greater than n, and planes be drawn from each angle to the points, so that the two planes lying over each edge cut the second semiaxis belonging to that edge at the smaller distance n, and the third axis at the greater distance m, then the hexakisoctahedron is produced, the parameters are $m : n : 1$, its sign mOn, and the most common varieties $3O\frac{3}{2}$, $4O2$, and $5O\frac{5}{2}$, seen in diamond and fluorite.

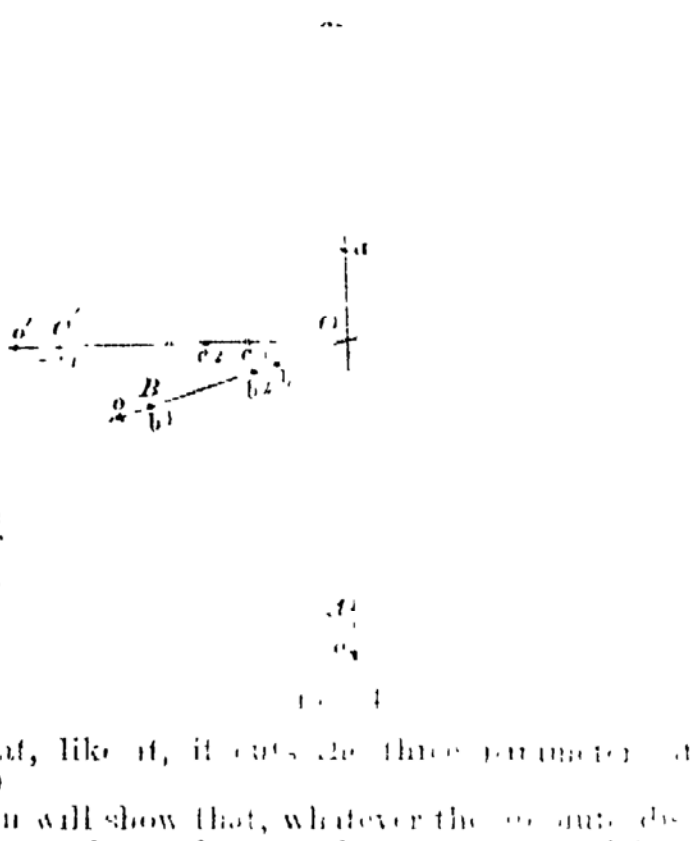
It must be observed that the numbers in the above signs refer to the parameters of the faces, not to the axes of the crystal, which are always equal. One parameter also has always been, in the above, assumed 1, and then either one only of the two other parameters, marked by the number before O, or both of them, marked by the numbers before and after O, have been changed.

In the above consideration of the mode of derivation of the forms actually found in nature, which belong to the cubic system, it will be observed (though the illustrations were limited) that the values of m and n in the signs indicated, by the precision of the proportion to 1, 2, or 3, a definite numerical relationship. This at once led up to the extended observations which established the law above stated of proportionality in the modification of crystals, or the rationality of the parameters, which gives a mathematical basis to the science, adding to symmetry of arrangement a numerical relation in the position of the planes.

To illustrate this in connected form (and not merely with special reference to the mode of notation or expression of Naumann, which is that adopted in the subsequent descriptions), let AOA', BOB', COC' be 12 in the three axes of a crystal, drawn in perspective and cutting one another in the centre O. The semiaxes OA, OB, OC are three parameters. Now in the line OA take $Oa_2 = \frac{1}{2}OA$, and $Oa_3 = \frac{1}{3}OA$, making as many points as may be necessary between OA, *rational fractions* of OA. Subdivide OB and OC in a similar manner. Further produce OA, OB, OC to *Ao*, *Bo*, *Co*, in each direction to an infinite distance, or to a supposed infinite distance as expressed by the arrow-head; and suppose these extended axes to be divided in a manner similar to the subdivision of the parameters, by rational multiples of OA, OB, and OC. *All the planes of a crystal will be parallel to one or other of the planes which pass through three of the points thus determined.*

First, in order to apprehend the relationship of faces to these axes or to the half axes,—the parameters of the faces,—let us suppose one

lane of a crystal to be so situated as to cut the three parameter A, OB, OC at their extremities A, B, C, which it must be remem



bered are points equidistant from the centre; r let it be supposed nat a glass plate rests pon three intersecting wires at such oints. It is evident int such a plane or late will have a definite inclination or lope. Suppose further a second plane r plate to exist, hich cuts the three emiaxes in the points a_2, b_2, c_2, which have een measured off along with a_1, b_1, c_1) s equidistant from O. t will be evident that uch a plane, though maller, will be parallel o the first, seeing that, like it, it cuts the three parameters at qual distances from O.

A little consideration will show that, whatever the equal distances from the centre may be, so long as the proportional subdivisions are equal, no new slope of the [illegible] plates or planes is possible; planes so situated must be parallel and are the [illegible] which may be adopted to express the slope of one or another series must be applicable to all. A plane, however, cutting the points a_1, b_1, c_1 will have quite a different slope.

Let us now suppose a plane to cut a different set of the parameters, namely, OA', OB, OC', in the points a_3, b_1, c_1. Such a plane would be parallel to one cutting the points a_3, b_2, c_1, and also to the set of planes first described, but on the opposite side of the centre of the crystal. If again, however, we had a plane cutting the parameters OA' and OB' in a_3, b_1, but the second OC in the point c_2, it is clear that the slope of this plane would be quite different from that of the planes just described, but it would be parallel to the plane cutting the points a_3, b_1, c_1. This slope, like the other, evidently depends, not on the absolute length of the portions OA', OB', OC' cut off, but upon their proportion, or ratio—and such is the case with all the planes which are referred to the parameters.

As there are three axes, and each or all of them may be cut at any points and at any ratios, it is evident that the number of planes which is possible is infinite; and it must be also evident that the inclinations of all are fixed or determinate if we know the ratios. While, however, the possible number of planes is infinite, the actual number occurring among minerals is either small or moderate, in virtue of the fact that the ratios of subdivision of the axes are always simple, and not numerous.

Naumann's symbols for the notation or individualizing of planes have been glanced at. A simpler method is that of employing as indices the denominators (if simple fractions) of the fractional parts of the axis cut. Thus 111 is used for any plane parallel to that cutting the axes in a_1, b_1, c_1; 122 for those parallel to a_1, b_2, c_2, or a_2, b_1, c_2; and so on.

When any of the points referred to have negative signs, the corresponding indices have negative signs placed over them. Thus $\bar{1}22$ is the index for a plane parallel to $a'b'c$. But if the index of the plane a'_1, $b\infty$, c'_2, as here indicates infinity, that is, the plane never would cut the axis B however far it were extended, in other words, it is parallel to it. The necessity for changing the axes is brought about by the occurrence of highly examinations, planes, which in many cases would not meet the axes at all unless these were prolonged.

If the axes are unequal, as in the trimetric forms, then the ratios are of the same character, except that the relative lengths of the axes come into consideration; but here, as in the regular system, rational values cannot occur, and in even the most complex crystals they seldom exceed seven, either as aliquot parts or multiples.

It will thus be seen that in crystals there is no haphazard scattering of faces, but a complete subserviency to law, a law which may be said to be the linear equivalent to the law of multiple proportions by weight, and Gay Lussac's law of multiple proportion in combination by volume.

In abbreviation of all the systematic modes of notation, letters of the Latin and Greek alphabets are frequently employed in a more or less arbitrary manner, and with advantage in the case of highly complex forms.

6. *The Law of Symmetry of Crystalline Combination* is the consequence of the law of symmetry and the law of the rationality of the parameters, and has been partially stated in enunciating these laws. It is thus expressed: (1) a substance can only crystallize in forms, whether simple or compound, which have the same relative symmetry, that is, belong to the same crystalline system, and the parameters of the faces of which bear a simple relation to each other, that is, belong to the same axes; (2) a form cannot be modified by faces belonging to a different system, or a different series.

Certain exceptions to the first part of this law occur. The element carbon occurs as the diamond, which is cubic, and as graphite, which is hexagonal. Sulphur occurs near volcanoes in needle crystals belonging to the oblique prismatic system, and also in cakes deposited apparently from solution in crystals belonging to the right prismatic system. Titanic acid is tetragonal in rutile, and rhombic prismatic in brookite. Carbonate of lime is hexagonal in calcite, and prismatic in aragonite. These are probably only apparent exceptions. The elementary substances which seem to form them occur in different allotropic states with different amounts of specific heat, and it is probable that in these different states they do not form the above modifications, which are therefore, in every respect, except in their chemical composition, different mineral bodies. The physical difference between diamond and graphite may suffice as an illustration. The diamond is transparent, colourless, brittle, and extremely hard; graphite is opaque, black, tough, and so soft as to be utilized as a lubricant.

Spheres of Projection. The foregoing scheme for the development of the relations which subsist between faces of crystals and their axes affords but slight aid in displaying the position of the faces, or their mutual relationships. The delineation even of a considerable series of crystalline forms does not indeed seem to be thereon account first, of very unequal development as to size of the faces of crystals, and, secondly, on account of the *habit* or development of the surface not only differing largely, but being special to certain localities, as to the total absence of some faces, and to the preponderance of others.

Maps of the whole direction occupied by the forms of each mineral have been happily projected for such display. The projection is laid down as on a globe, in accordance with stereographic projection, and admitting of calculation according to the laws of spherical trigonometry. These globe maps are called "spherical projections." The centre O is the common centre of the crystal and of the sphere on which the axes intersect. The three axes will of course meet the circumference of the sphere in six points, called the "poles of the axes." From the centre radii are supposed to be drawn, perpendicularly to each plane. It is evident that such radii will have fixed inclinations to each other. They are called "normals" to the planes, and the points on which when produced they meet the circumference of the sphere of projection are called the "poles" of the corresponding faces. A face and its pole thus can for only one crystal. The angle included by any two normals is the supplement of that included by the two corresponding faces.

It is thus easy to determine the angles of any two normals when that of the corresponding faces is known, or *vice versâ*. For if the angle between two faces is 125°, that of the normals will be 55°. The plane sheet is thus especially adapted to enable us to avoid complicated calculation and to calculations afforded by the foregoing fact that faces of a zone be parallel to each other, forming zones, for, when projected on such a sphere, the normals of the parallel faces will all lie in one plane; and the pole, or centre of the surface in the direction of one face, may be connected by an arc of a great circle on the sphere. This is called the "zone circle." A line drawn through the centre of the

ne, cutting it at right angles, is the "zone axis"; it el to all the faces, and intersections of the faces (if e extended enough to intersect), of the zone. A face common to two or more zones, its normals will then with the intersections of the several zone planes. e absence of actual sphere upon which to detail the ich go to form the "sphere of projection" of each ey the hemisphere is represented on a plane surface. s of necessity the disadvantage, except as regards nferential zone, of introducing spherical distance on foreshortening of all parts lying near the circence; but the eye soon gets accustomed to this. Fig. nts the principal zones of the cubic system, and

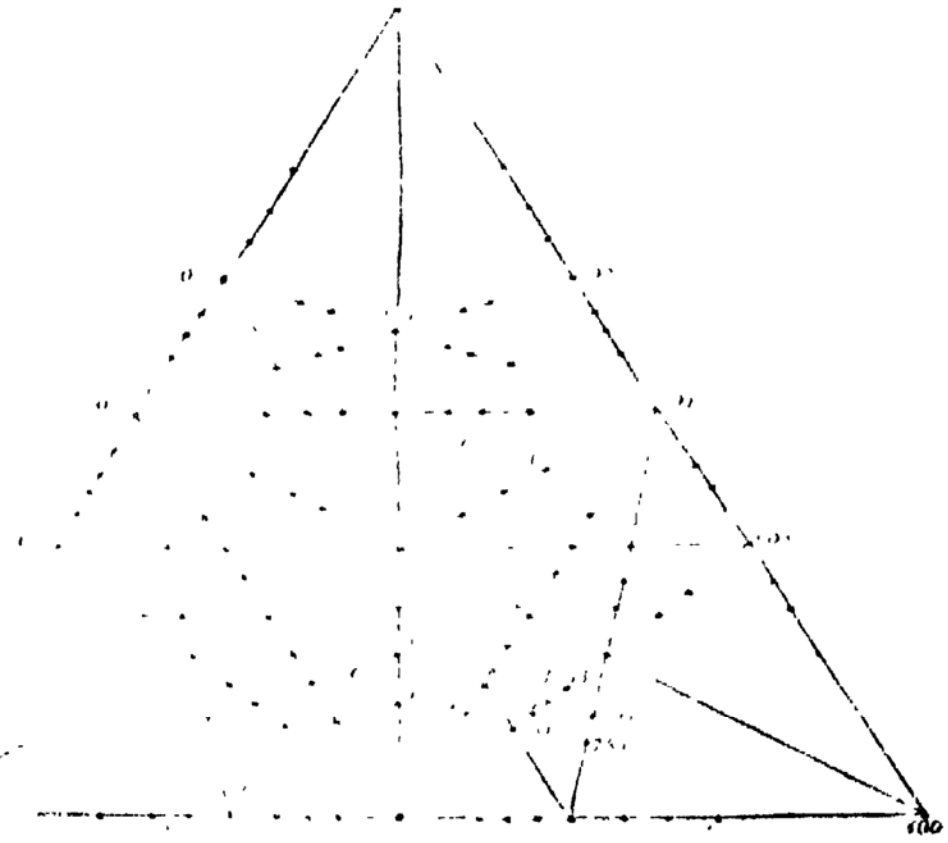

Fig. 44.—Projection of the Cubic System in Octant of Sphere.

rhombic dodecahedron. Considering this as a ion of a globe to a large circle equal to represent and longitude, and so that all the faces in this fall into some zone circle, it is clear that the and longitude of all normals may be readily laid nd their relations at once determined by spherical metry. Fig. 44 shows the arrangement of the poles ne forms belonging to the cubic system noticed above, or referred to in the present article,—delineated on an octant of the sphere of projection. It displays the perfect regularity of the system.

Hemihedral and Tetartohedral Forms.—The exception to the second law (that of symmetry), which was formulated by Weiss was to the effect that one-half or even one-fourth only of the faces which go to form a holohedral crystal may be present. When but one-half of the faces present themselves, the form is termed hemihedral; when only one-fourth, it is tetartohedral. These restrained developments have now to be considered. In hemihedral forms the development is restrained, but symmetry is not deranged half the similar parts are still alike, though unlike the other half.

There are two classes of hemihedral forms:

I. Those forms in which half the similar angles or edges are modified independently of the other half ("hemi-holohedral") producing

1. In the monoclinic and dimetric systems "tetrahedral" and "sphenoidal" forms, by the independent replacement of the alternate angles, their opposite faces are not parallel, and they are hence called "inclined" hemihedrons; as in chalcopyrite, boracite. The replacement in the dimetric system of two opposite basal edges of one base and the other two at the opposite base is of the same

2. In the [illegible] system "monoclinic" forms, by the replacement [illegible] similar parts of one base and the diagonally [illegible] unlike the other half; as in datholite, humite

3. In the [illegible] and hexagonal systems "hemimorphic" forms [illegible] segments at the opposite extremities of the [illegible] as in [illegible] calamine, tourmaline.

4. In the [illegible] rhombohedral system, by the replacements of the alternate basal [illegible] or angles of the rhombohedron, forms usually called tetartohedral or quarter forms, on the ground that a rhombohedron is a hemihedral form derived from the hexagonal prism, which is the type of the hexagonal system. Rock crystal is usually developed according to this law.

II. Those forms in which all the similar angles or edges are modified but by half the full or normal number of planes ("holohemihedral"), producing

1. In the monometric system "pyritohedral" forms, by a replacement of the edges or angles; as in pyrites. Such forms have opposite faces parallel, and are often called parallel hemihedrons.

2. In the dimetric system "pyramidal" and "scalenoidal" forms by a replacement of the eight solid angles of the primary prism according to two methods.

3. In the hexagonal system "pyramidal" and "gyroidal" forms, by a replacement of the solid angles of the hexagonal prism, or of the six lateral angles of the rhombohedron, according to two methods as in quartz and apatite.

The above illustrations show that hemihedrism is not only divided into two classes, but is of various kinds, and these have been systematized as follows: "holomorphic," in which the occurring planes pertain equally to the upper and lower (or opposite) ranges of sectants, as in ordinary hemihedrons; and (2) "hemimorphic," in which each set of planes pertains to either the upper or the lower range, but not to both. As to the relative position of the sectants which contain the planes, the forms may be vertically direct as in boracite, vertically alternate, as in the tetrahedron, the rhombohedron and the plagihedral faces of quartz; and vertically oblique, as in many forms of chondrodite.

In hemimorphic forms [illegible] symmetry is deranged; the crystals are bounded at the opposite [illegible] ends of their main axes by faces belonging to distinct forms or modifications,—always, however, of the same system, hence only the upper [illegible] of each crystal can be regards the form there and it is half formed. crystal of tourmaline, which is bounded

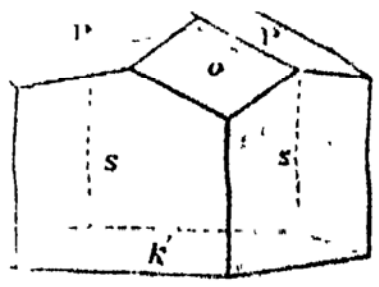

Fig. 45.

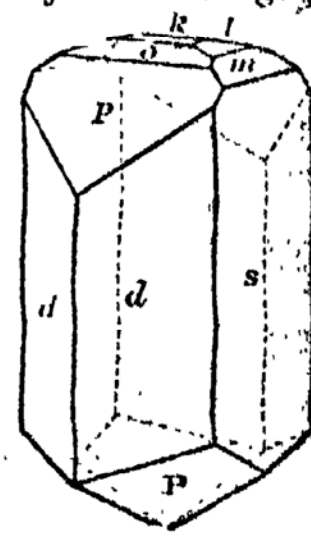

Fig. 46.

into the [illegible] terminals show the [illegible] brachydomes o and p, and two macrodomes m and l

[1] As the parts of either half are alternate, there still results a symmetrical solid. As either one or other half may be the one thus modified there may result two such symmetric solids, which stand in an inverse position to one another. When the modifications affect the upper right hand solid angle, the resulting form is called +; when the upper left hand angle it is -.

whilst on the lower end it is bounded by the faces P of the primary alone.

It has been found that all hemimorphic crystals become electrically polar when heated, that is, exhibit opposite kinds of electricity at opposite ends of the crystal. The subject will be more fully considered under the electricity of minerals.

The hemihedral forms of the cubic system are the following:—

1. The tetrahedron (fig. 47), hemihedral of the octahedron, bounded by four equilateral triangles. It has six equal edges faces meeting at 70° 32′, and four trigonal angles. The principal axes join the middle points of each two opposite edges. Example fahlore, boracite, and helvine.

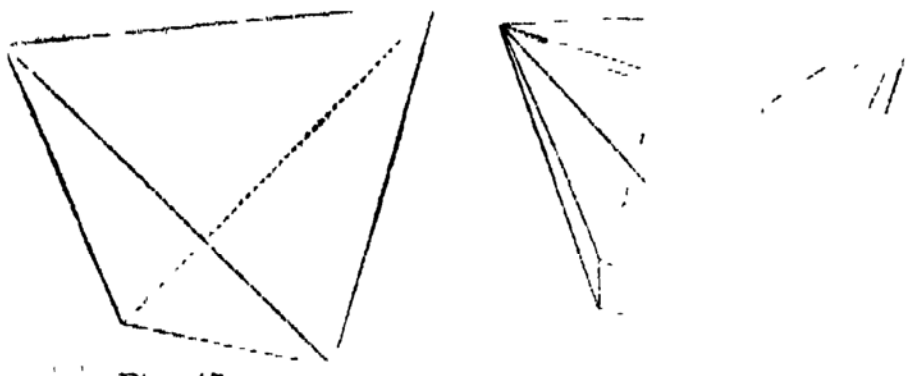

Fig. 47.

2. The trigonal dodecahedrons (fig. 48), h… of the tetrahedron, are bounded by twelve isosceles triangles, and vary in general form from the tetrahedron to the cube. The … edges corresponding to those of the … tetrahedron, and twelve shorter, placed three and three over … of its faces, and four hexagonal and four trigonal angles. Exam… tetrahedrite.

3. The deltoid dodecahedrons (fig. 49), hemihedral of the trisoctahedron, are bounded by twelve deltoids, and form from the tetrahedron on the one hand to … rhombdodecahedron on the other. They have twelve long edges lying in pairs over the edges of the … bed tetrahedron, and twelve shorter edges, three and three over … faces. The… six tetragonal (rhombic), four acute trigonal, and four obtuse trigonal angles. The principal axes join … rhombic angles. Example: tetrahedrite.

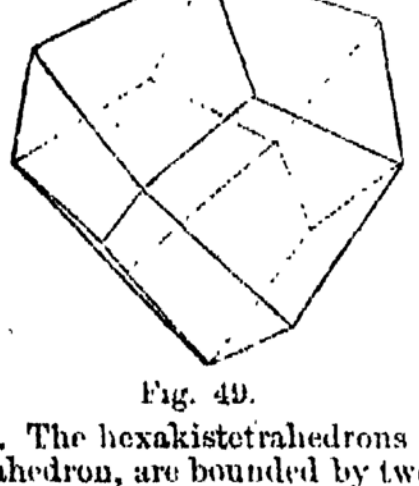

Fig. 49.

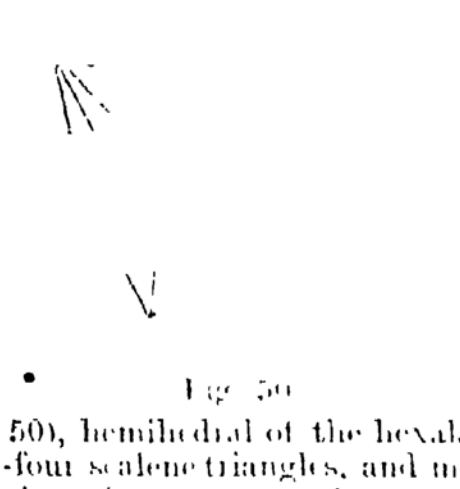

Fig. 50.

4. The hexakistetrahedrons (fig. 50), hemihedral of the hexakisoctahedron, are bounded by twenty-four scalene triangles, and most commonly have their faces grouped in four systems of six each. The edges are twelve shorter and twelve longer, lying in groups of three over each face of the inscribed tetrahedron, and twelve intermediate in pairs over its edges. The angles are six rhombic, joined in pairs by the principal axes, and four acuter and four obtuser hexagonal angles. Example, diamond.

In these forms, often named "tetrahedral," the faces are oblique to each other. Their derivation and signs are as follows. The tetrahedron arises when four alternate faces of the octahedron, two opposite above and two intermediate below, are enlarged so as to obliterate the other four; and its sign is hence $\frac{O}{2}$. But, if either four faces may be thus enlarged or obliterated, two tetrahedrons can be formed, similar in all respects except in position, and together making up the octahedron. These are distinguished by the signs + and −, added to the above symbol, but only the latter in general expressed, thus $-\frac{O}{2}$. In all hemihedric systems two forms similarly related occur, which may thus be named complementary forms. The trigonal dodecahedron is derived from the tesitetrahedron by the expansion of the alternate trigonal groups of faces; its sign is $\frac{m O m}{2}$, the most common variety being $\frac{2 O 2}{2}$. The deltoid dodecahedron is in like manner the result of the increase of the alternate trigonal groups of faces of the triakisoctahedron, and its sign is $\frac{m O \frac{m}{2}}{2}$. Lastly, the hexakistetrahedron arises in the development of alternate hexagonal groups of faces in the hexakisoctahedron, and its sign is $\frac{m O n}{2}$.

Two semitesseral forms with parallel faces occur. (1) The pentagonal dodecahedrons (fig. 51), bounded by twelve *symmetrical* pentagons, vary in general aspect between the cube and the rhombic dodecahedron. They have six regular (and in general longer) edges, lying over the faces of the inscribed cube, and twenty-four, generally shorter (seldom longer), edges, usually lying in pairs over its edges. The solid angles are eight of three equal interfacial angles, and twelve of three interfacial angles, of which only two are equal. Each principal axis unites two opposite regular edges. This form is derived from the tetrakishexahedron, and its sign is $\frac{\frac{m}{2} O n}{2}$. It is found frequently in iron pyrites and cobaltine.

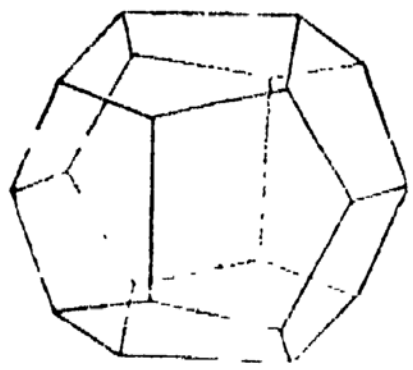

Fig. 51.

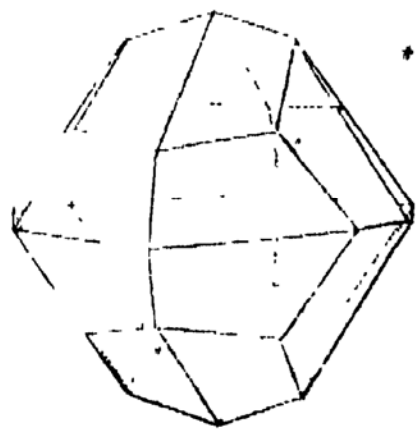

Fig. 52.

(2) The dyakisdodecahedron (fig. 52), bounded by twenty-four trapezoids with two sides equal, has twelve short, twelve long, and twenty-four intermediate edges. The angles are six equiangular rhombic, united in pairs by the principal axes, eight trigonal, and twenty-four irregular tetragonal angles. It is derived from the hexakisoctahedron, and its sign is $\left[\frac{m O n}{2}\right]$, the brackets being used to distinguish it from the hexakistetrahedron, also derived from the same primary form. It occurs in iron pyrites and cobaltine. The two other semitesseral forms, the pentagonal

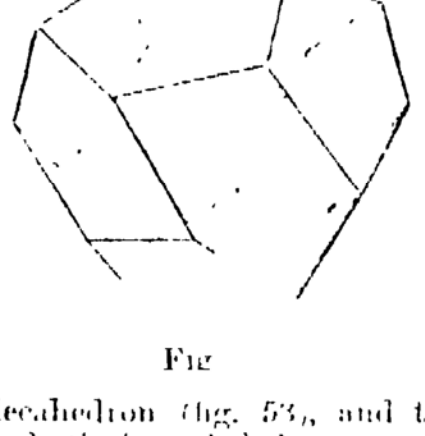

Fig.

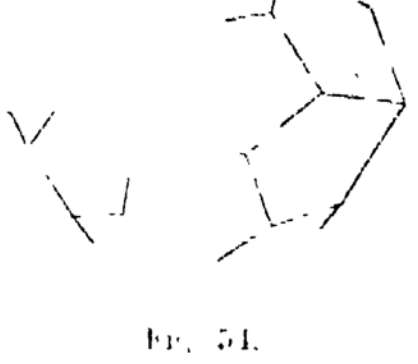

Fig. 54.

dodecahedron (fig. 53), and the pentagonal icositetrahedron (fig. 54), both bounded by *irregular* pentagons, have not yet been observed in nature.

Combinations. The above-mentioned forms of the tesseral system (and this is true also of the five other systems of crystallization) not only occur singly, but often two, three, or more occur united in the same crystal, forming what are named combinations.

In this case it is evident that no one of the individual forms can be complete, because the faces of one form must interfere with, by diminishing, the faces of other forms. A combination therefore implies that the faces of one form shall appear symmetrically disposed between the faces of other forms, and consequently take the place of certain of their edges and angles. These edges and angles are thus, as it were, cut off, and a greater number of new ones produced in their place, which properly belong neither to the one form nor the other, but are angles of combination. These new faces are hence termed modifications, and the original or primary or simple form is said to be modified. Usually one form predominates more than the others, or has more influence on the general aspect of the crystal, and hence is distinguished as the predominant form, the others being considered subordinate.

The sign of the combination consists of those of its constituent forms, written in the order of their influence or importance in the combination, with a point between each pair.

It will be readily seen that such combinations may be exceedingly numerous, or rather infinite; and only a few of the more common

…ticed. Many others more complicated will occur in the …e part of the article. Among holohedral combinations, …octahedron and rhombic dodecahedron deserve notice as the predominant…s. In fig. 27 the cube has its solid angles replaced by the faces of …ahedron, which truncate the angles, and the sign of this …tion is $\infty O\infty$, O. In fig. 28 the process may be regarded as …roceeded still farther, so that the faces of the octahedron …ual those of the cube, while in fig. 29 they now predom…e sign, still of the same two elements, but in reverse …O, $\infty O\infty$. It will thus be seen that through an increase in …nt of the abstraction of the faces of the cube, the figure …ses from a cube to that of the octahedron. ch of the five systems which follow there is this
e from the cubic system that one axis is always
to (longer or shorter than) the others. This is

placed erect, and named the chief axis, its ends are pole
and the edges connected with them polar edges. The
other axes are named subordinate or lateral axes, and the
plane that passes through them is the base. A plane
through the chief and a lateral axis is a normal chief
section. In these systems also occur the three forms of
"pyramids," "prisms," and "pinacoids." (1) The pyra-
mids have their faces triangles. Pyramids in crystallo-
graphy are each composed of two isometric pyramids
placed base to base, and named "closed forms" as the
crystals are shut in by definite faces on every side. (2)
The prisms are bounded by plane faces parallel to one axis.
They are thus of unlimited extent in the direction of that
axis, and therefore named "open forms," but in solid crystals
are shut in by faces of other forms. (3) The pinacoids, or
tables, have two faces intersecting one axis and parallel
to the others, and thus are also open forms, or unlimited in
the direction of the two axes. Forms (2) and (3), when com-
joined, mutually shut in each other, or produce closed forms.

II. *Pyramidal or Tetragonal System.* The system has
three axes at right angles, two of them equal, and the chief
axis longer or shorter. The name tetragonal is derived
from the form of the base, which is usually a quadrangular.
There are eight distinct forms, of which five are closed. (1)
Tetragonal pyramids, of which there are two, are inclosed by eight isosceles
triangles, with four middle edges all
in one plane, and no flat polar edge.
There are three kinds of this form

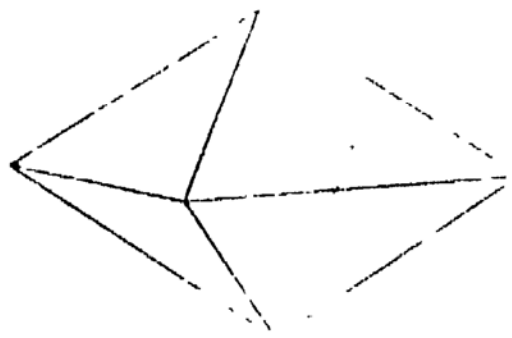

Fig. 78.

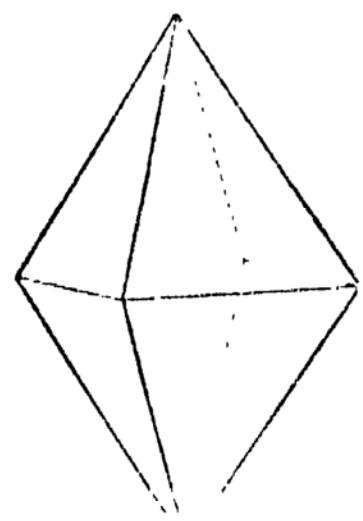

Fig. 79

distinguished by the position of the
lateral axes. In the first these are
opposite angles, in the second
they intersect the middle edges equally; and in the third the
lie in an intermediate position, or divide the edges unequally,
the last being hemihedral forms. These pyramids are also
distinguished as obtuse (fig. 79, acute (fig. 79, according as the
vertical angle is greater or less than in the
regular octahedron. (2) Ditetragonal pyra-
mid-cube, so are bounded by eight equal
triangles, whose base lines are all in one

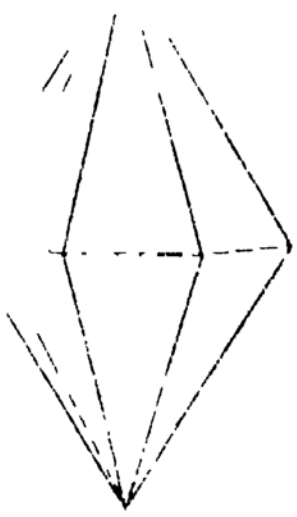

Fig. 80.

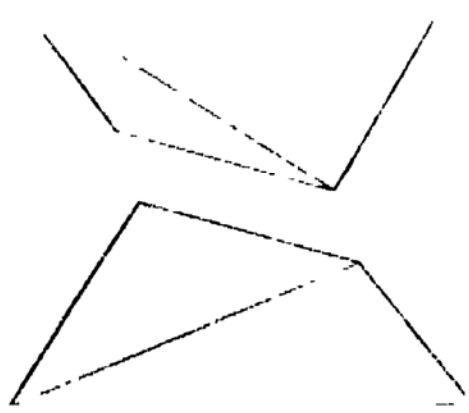

Fig. 81.

plane. This form rarely occurs except in combinations. (3) Tetra-
gonal sphenoids, four faces, bounded by four isosceles triangles,
the hemihedral form of the first variety of tetragonal pyramid.
(4) The tetragonal scalenohedron (fig. 82), bounded by eight scalene
triangles, whose base lines fall in a zigzag line, is the hemi-
hedral form of the ditetragonal pyramid. Nos. (3) and (4) are rare.
(5) The tetragonal trapezohedron is not found in mineralogical com-
form. The three open forms are (1) tetragonal prisms, bounded
by four planes parallel to the principal axis, which may be either
longer (fig. 83) or shorter (fig. 84) than the lateral axes, (2) ditet-
tragonal prisms, bounded by eight similar planes; and (3) the basal
pinacoid, consisting merely of two parallel faces bounding the prism
at the ends, above and below.

The various series of tetragonal crystals are distinguished from
each other only by their relative dimensions. To determine these

ne of the series must be chosen as the primary form, and for this urpose a tetragonal pyramid of the first variety, designated by P s its sign, is selected. The angle of one of its edges, especially he middle edge, found by measurement, determines its angular imensions, whilst the proportion of the principal axis a to the

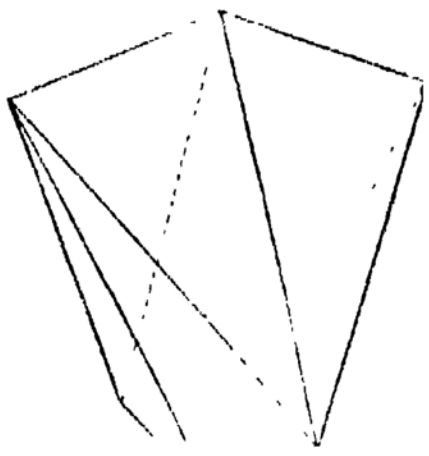

Fig. 82.

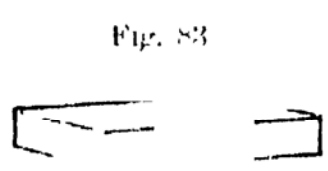

Fig. 83.

Fig. 84.

teral axes, supposed equal to 1, gives its linear dimensions. The rameters, therefore, of each face of the fundamental form are ; 1 ; a.

Now if m be any (rational) number, either less or greater than nity, and if from any distance ma in the principal axis planes be awn to the middle edge of P, then new tetragonal pyramids of e first order, but more or less acute or obtuse than P, are formed. he general sign of the pyramids is mP, and the most common

Fig. 85.

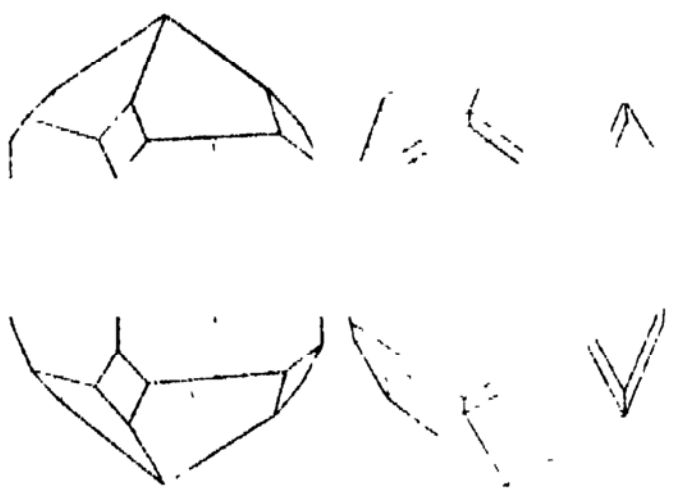

Fig. 86.

Fig. 87.

ances $\frac{1}{2}$P, 2P, and P, with the chief xis half, twice, or ance that of P. If becomes infinite, hen the pyramid sses into a prism, ndefinitely extended ong the principal xis, and with the gn ∞P. If m 0, hich is the case hen the lateral axes e supposed infinite, en it becomes a nacoid, consisting operly of two basal ces open towards e lateral axes, and signated by the gn 0P. The ditetra onal pyramids are oduced by taking each lateral axis stances n greater an 1, and drawing o planes to these nts from each the intermediate lar 1 : n. The parameters of these planes are therefore m : 1 : n, d the general sign of the form mPn, the most common values n being $\frac{1}{2}$, 2, 3 and ∞. When $n = \infty$, a tetragonal pyramid of e second order arises, designated generally by mP∞, the most mmon in the mineral kingdom being P∞ and 2P∞. The relation the two pyramids of the first order is shown in fig. 85, where BBBC is the first and ACCCX the second order of pyramid. In ke manner to the prism ∞P, the ditetragonal prisms ∞Pn

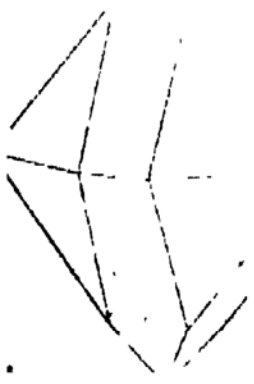

Fig. 88.

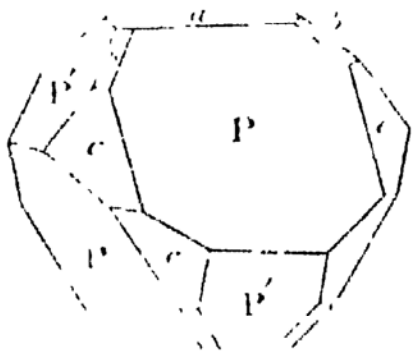

Fig. 89.

e derived, and, finally, when $n = \infty$ the tetragonal prism of the cond order, whose sign is ∞P∞.

The combinations of the tetragonal system are either holohedral or hemihedral; but the latter are rare. Prisms and pinacoids must always be terminated on the open sides by other forms. Thus in fig. 86 a square prism of the first order is terminated by the primary pyramid, and has its lateral angles again replaced by another more acute pyramid of the second order, so that its sign is ∞P, P, 2P∞.

In fig. 87 a prism of the second order is first bounded by the fundamental pyramid, and then has its edges of combination replaced by a ditetragonal pyramid; its sign is ∞P∞, P, 3P3. In fig. 88 the polar edges of the pyramid are replaced by another pyramid, its sign being P, P∞. In fig. 89 a hemihedric form, very characteristic of chalcopyrite, is represented,—P and P′ being the two sphenoids, a the basal pinacoid, and b, c two ditetragonal pyramids.

III. *The Hexagonal System.*—The essential character of this system is that it has four axes,—three equal lateral axes intersecting each other in one plane at 60°, and one principal axis at right angles to these. The plane through the lateral axes, or the base, from its hexagonal form, gives the name to the system. As in the last system, its forms are either closed or open. They are divided into holohedral, hemihedral, and tetartohedral, the last, which are rare, having only a fourth part of the faces developed. Only a few of the more common forms require to be here described.

The hexagonal pyramids (figs. 90, 91) are bounded by twelve isosceles triangles, and are of three kinds, according as the lateral axes fall in the angles, in the middle of the lateral edges, or in another point of these edges, the last being hemihedral forms. They are also classed as acute or obtuse, but without any precise limits. The trigonal pyramid is bounded by six triangles, and may be viewed as the hemihedral form of the hexagonal. The dihexagonal pyramid is bounded by twenty-four scalene triangles, but has never been observed alone, and rarely even in combinations. The more common prisms are the hexagonal of six sides; in these the vertical axis may be either longer than the lateral, as in fig. 92, or shorter, as in fig. 93. There are also dihexagonal, of twelve sides.

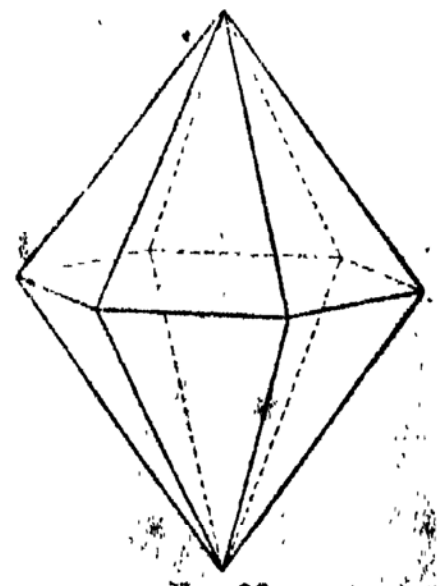

Fig. 90.

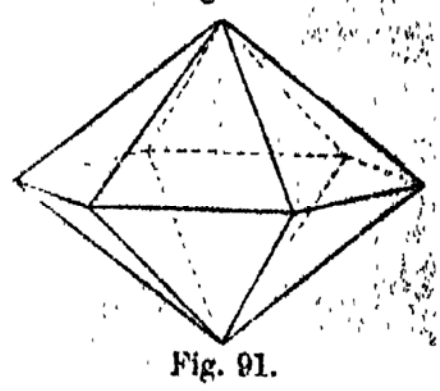

Fig. 91.

A particular pyramid P is chosen as the fundamental form of this system, and its dimensions determined either from the proportion of the lateral to the principal axis (1 : a) or from the measurement of its angles. From this form (mP) others are derived exactly as in the tetragonal system. Thus dihexagonal pyramids are produced with the general sign nPn, the chief peculiarity being that whereas the tetragonal system n might have any rational value from 1 to ∞, in the hexagonal system it can only vary from 1 to 2, in consequence of the geometric character of the figure. When n = 2, the dihexagonal changes into an hexagonal pyramid of the second order, whose sign is mP2. When $m = \infty$, various prisms arise from similar changes in the value of m, and when m = 0 the basal pinacoid is formed.

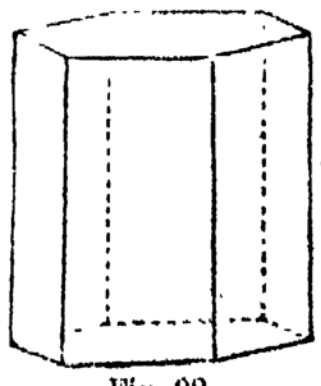

Fig. 92.

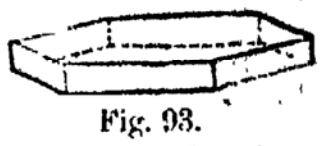

Fig. 93.

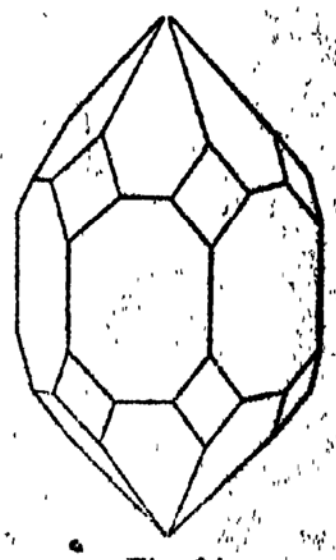

Fig. 94.

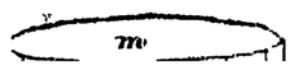
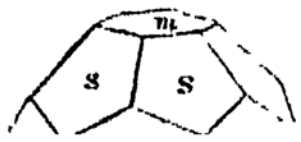
Few hexagonal mineral species form perfect holohedral combinations. Though quartz and apatite appear as such, yet properly the former is a tetartohedral, the latter a hemihedral species. In holohedral species the predominant faces are usually those of the hexagonal prisms ∞P (fig. 92) and ∞P2, or of the pinacoid 0P (fig. 93); whilst Pris the pyramids P and 2P2 are the most common subordinate forms. Fig. 94 represents the prism, bounded on the extremities by two pyramids,—one, P, forming the apex, the other, 2P2, the rhombic

faces on the angles, or ∞P, P, 2P2. Fig. 95 is a similar form, the upper part of the pyramid being replaced by the pinacoid. In some crystals the lateral edges of the prism are replaced by the





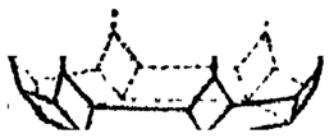


Fig. 95. Fig. 96. Fig. 97.

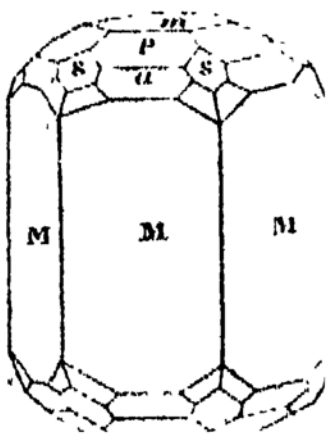
second prism ∞P2 (fig. 96), producing an equiangular twelve-sided prism, which always represents the combination ∞P, ∞P2, and cannot occur as a simple form. Figs. 97, 98 are combinations in this



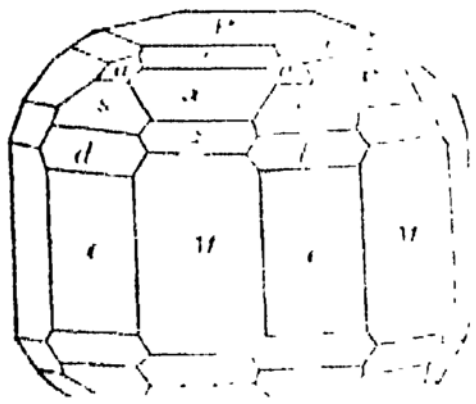


Fig. 98. Fig. 99

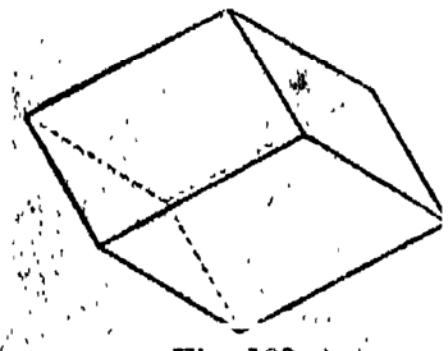
system seen in beryl. An example of a more complicated combination is seen in fig. 99, of a crystal of apatite, whose form with the corresponding letters is ∞P(*M*), ∞P2(*c*), 0P(*P*), 4P(*r*), P(*u*), 2P(*s*), P2(*a*), 2P2(*s*), 4P2(*d*).

Hexagonal minerals frequently crystallize in those series of hemihedral forms that are named "rhombohedral," from the prevalence in them of rhombohedrons. These (figs. 100, 101) are bounded by



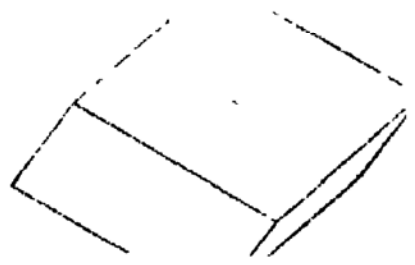


Fig. 100. Fig. 101

six rhombi, whose lateral edges do not lie in one plane, but rise and fall in a zigzag manner. The principal axis unites the two trigonal angles, formed by three equal plane angles; and in the most common variety the secondary axes join the middle points of two opposite edges. When the polar edges form an angle of more than 90°, the rhombohedrons are named obtuse; when of less than 90° acute; fig. 102 represents the first, fig. 103 the second. Hexagonal scalenohedrons (fig. 104) are bounded by twelve scalene triangles, whose lateral

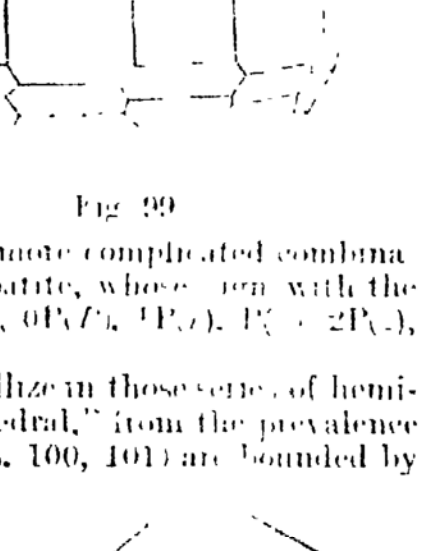

Fig. 102. Fig. 103.

edges do not lie in one plane. The principal axis joins the two hexagonal angles, and the secondary axis the middle points of two opposite lateral edges.

The rhombohedron is derived from the first order of hexagonal pyramid by the hemihedral development of its alternate faces. Its general sign should therefore be $\frac{m}{2}$P; but on several grounds it is found better to designate it by R or *m*R, and its complementary figure by −*m*R. When the prism or pinacoid arises as its limiting form, they are designated by ∞R and 0R, though in no respect changed from the limiting forms ∞P and 0P of the pyramid. The scalenohedron is properly the hemihedral form of the dihexagonal pyramid, but is more easily understood as derived from the inscribed rhombohedron *m*R. If the halves of the principal axis of this be multiplied by a definite number *n*, and then planes be drawn from the extremities of this enlarged axis to the lateral edges of the rhombohedron, as in fig. 105, the scalenohedron is constructed. It is now designated by *m*R*n* (the *n* on the right here referring to the chief axis), and the dihexagonal prism in this series by ∞R*n* (formerly *m*R^n and ∞R^n).

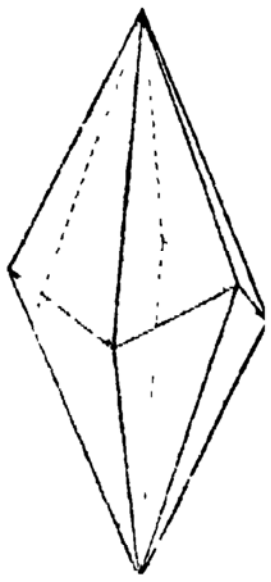

Fig. 104.

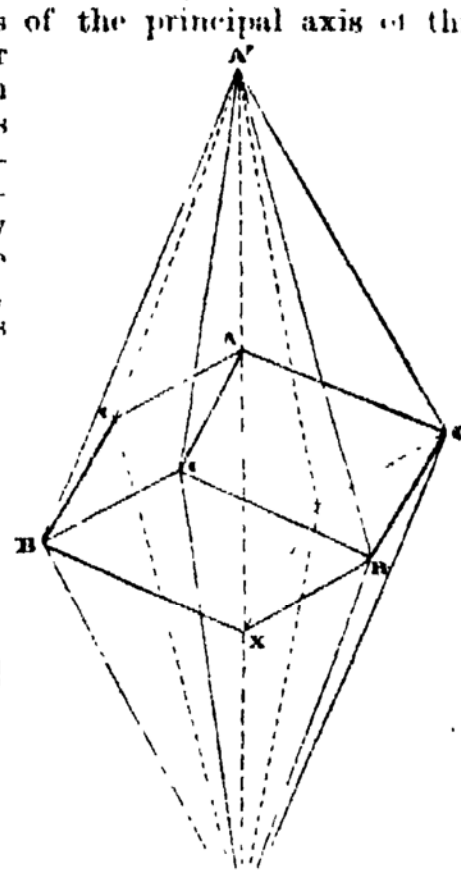

Fig. 105.

The combinations of rhombohedral forms are very numerous, several hundreds having been described in calc-spar alone. Among the most common is the prism in combination with a rhombohedron, as seen in the twin crystal of calc-spar (fig. 106), with the sign ∞R, −½R, the lower half being the same form with the upper, but turned round 180°. In fig. 107 the rhombohedron *m*R has its pole

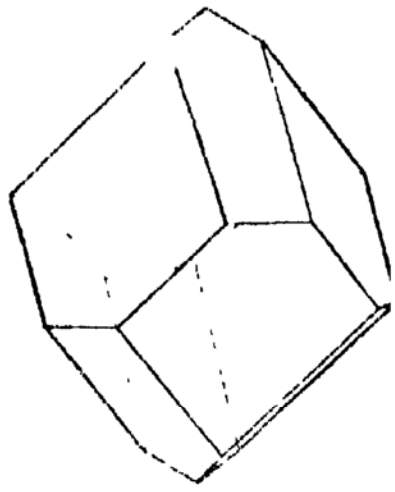

Fig. 106 Fig. 107

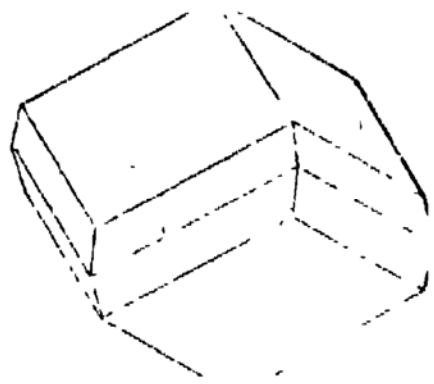
edges replaced by another rhombohedron −½*m*R, and in fig. 108 its lateral edges bevelled by the scalenohedron *m*R*n*. A more complex combination of five forms is represented in the crystal of calc-spar fig. 109, its sign, with the letters on the faces, being R^3(*r*),



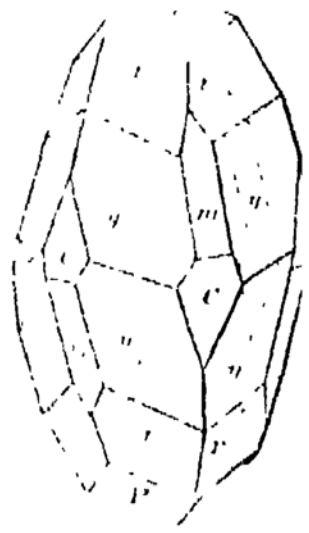


Fig. 108. Fig. 109.

R^3(*e*), R(*P*), 4R(*m*), −R(*e*). Tetartohedral combinations are also most distinctly in rock-crystal.

IV. *Right Prismatic or Rhombic System.* - This system is characterized by three unequal axes, all at right angles to each other. Any one of these may be assumed as the chief axis, when the others are named subordinate. The plane passing through the secondary axes, or the base, forms a rhombus, and from this one of its names is derived. As prismatic forms are most frequent (the prism standing vertically on the rhombic base), it is best defined as the right prismatic. This system comprises only a few varieties of forms that are essentially distinct, and its relations are consequently very simple.

There are two dodecahedrons (fig. 113), bounded by eight [illegible]

They [illegible] merely mark only the position of the [illegible] to the [illegible] of the fundamental crystal [illegible] descend of necessity without [illegible] ordinate magnitude of the [illegible] axis.

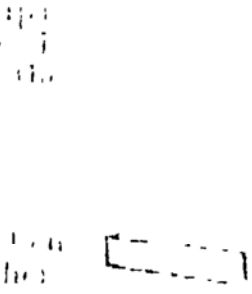

Fig. 119.

By multiplying the principal axes by any rational number m, [illegible] greater or less than 1, a series of pyramids arise, whose general sign is mP, and their limit are the prism and pinacoid, the whole series being contained in the formula $\infty P \ldots mP \ldots P \ldots \frac{1}{m}P \ldots 0P$, which is the fundamental series, the lateral axes always remaining unchanged.

From each member a new series may, however, be developed in two directions, by increasing one or other of the lateral axes. When the macrodiagonal is thus multiplied by any number n greater than 1, and planes drawn from the distance n to the poles edges a new pyramid is produced, named a macropyramid, with the [illegible] mark over the [illegible] When [illegible] a macrodome results, when the [illegible] If the shorter axis is multiplied the brachypyramids and [illegible] domes are produced with the general symbol $m\breve{P}n$. So all [illegible] prisms ∞P on the one [illegible] to number or [illegible] $\infty\breve{P}n$ with the [illegible] pinacoid $0\breve{P}\infty$ on the other, numbers [illegible]

[illegible] of the brachypinacoid. In figs. 120, 121 the [illegible] are shown in their relation to the primitive pyramid

Fig. 122

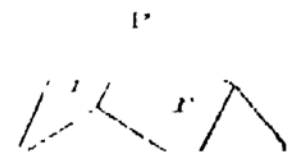

Fig. 123.

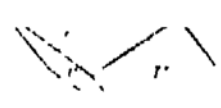

Fig. 124.

The pyramid seldom occurs independent, or even as the predominant form in a combination; sulphur, however, is an exception. Prisms or pinacoids usually give the general character to the crystal, which then appears either as a columnar or tabular or even rectangular pyramidal form. The determination of the position of the crystals, as vertical or horizontal, depends on the choice of the chief axis of the fundamental form. In the topaz crystal (fig. 126) the brachyprism and the pyramid are the predominant element, associated with the prism, its sign and letters being $\infty P2$ l P. $\infty P(M)$. Fig. 123 of sulfate is another example, the macropinacoid $\infty\breve{P}\infty$ or M being combined with the pyramid $P(z)$, the brachypinacoid $\infty\breve{P}\infty(T)$, and the basal pinacoid $0P(T)$. Another instance is fig. 124 a hiortite crystal, where the brachyprism and pyramid combi

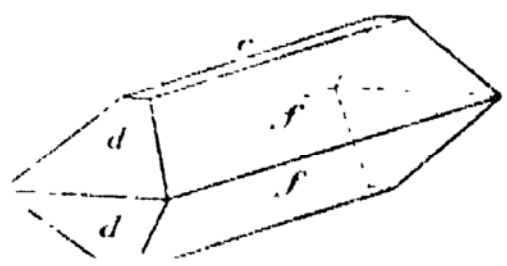

Fig. 125.

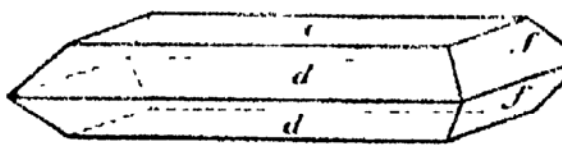

Fig. 126.

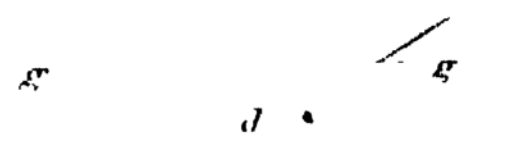

Fig. 127.

with the macrodome, or $\infty\breve{P}2$. P, $P\infty$. The above figures are very common forms of barytes, figs. 125 and 126 being both composed of the pinacoid 0P, a brachydome, and a macrodome, with sign $\frac{1}{2}P(e)$, $P\alpha(f)$, $\frac{1}{3}P\infty(d)$. The variation in aspect arises from the predominance of different faces; and fig. 127 consists of the macrodome $\frac{1}{2}P\infty$, the prism $\infty P(g)$, and the pinacoid 0P.

V. *The Oblique Prismatic System.*- This system is characterized by three unequal axes, two of which intersect each other at an oblique angle, and are cut by the third at right angles. One of the oblique axes is chosen as the chief axis, and the other axes are then distinguished as the orthodiagonal (right-angled) and clinodiagonal (oblique angled). The same terms are applied to the chief sections, and the name of the system refers to the fact that these two planes form with the base two right angles and one oblique angle C.

The forms of this system approach very near to those of the right prismatic series, but the inclination of the axes, even when almost a right angle, gives them a peculiar character, by which they are always readily distinguished. Each pyramid thus gives two altogether independent forms or hemipyramids.

Three varieties of prism also occur, vertical, inclined, and horizontal - with faces parallel to the chief axes, the clinodiagonal or the orthodiagonal. The horizontal prisms, like the pyramids, separate into two independent partial forms named hemiprisms or hemidomes. The inclined prisms are often designated clinodomes, the term prism being restricted to the vertical forms. Orthopinacoids and clinopinacoids are also distinguished, from their position in relation to the axes. The monoclinic pyramids (fig. 128) are bounded by eight scalene triangles of two kinds, four and four only being similar. Their lateral edges lie all in one plane, and the similar triangles are placed in pairs on the clinodiagonal polar edges.

Fig. 128.

The two pairs in the acute angle between the orthodiagonal and basal sections are designated the positive hemipyramid, whilst the two pairs in the obtuse angles of the same sections form together the negative hemipyramid. But, as these hemipyramids are wholly independent of each other, they are rarely observed combined. More frequently each occurs alone, and then forms a prism-like figure, with faces parallel to the polar edges, and open at the extremities. Hence, like all prisms they can only appear in combination with other forms. The vertical prisms are bounded by four equal faces parallel to the principal axis, and the cross section is a rhombus; the clinodomes have a similar form and section, whilst the horizontal prisms or domes have unequal faces, and their section is a rhomboid.

The mode of derivation of these forms closely resembles that of the rhombic series. A complete double pyramid is assumed as the fundamental form, and designated $\pm P$, in order to express the two portions of which it consists. Its dimensions are given when the proportion of its axes $a : b : c$ and the angular inclination of the oblique axes C, which is also the inclination of the orthodiagonal section to the base, are known.

The fundamental series of forms is $0P$ . . . $\frac{1}{2}mP$ . . . . $\pm P$ . . . . $\pm mP$ . . . . ∞P, from each of whose members, by changing the dimensions of the other axes, new forms may be again derived. Thus from $\frac{1}{2}mP$, by multiplying the orthodiagonal by any number n, a series of orthopyramids $\pm mP^{o}n$ is produced, with the orthodomes $mP^{o}\infty$ as limiting forms. The clinodiagonal produces a similar series of clinopyramids $\frac{1}{2}mP\,n$, with the limiting clinodome $mP^{c}\infty$ always completely formed, and therefore without the signs $\pm$ attached. From ∞P arise orthoprisms $\infty P^{o}n$ and the orthopinacoid $\infty P^{o}\infty$, and clinoprisms $\infty P^{c}n$ and the clinopinacoid $\infty P^{c}\infty$. In these signs the o or c attached to the P indicates that the orthodiagonal (o) or clinodiagonal (c) axis has been multiplied. Formerly the latter forms were enclosed in brackets, thus $(mP\infty) = mP\infty$.

The combinations of this system may be easily understood from their resemblance to those of the right prismatic, the chief difficulty being in the occurrence of *partial* forms, which, however, closely resemble the hemihedral forms of the previous systems. A few examples only need therefore be given.

Fig. 129 represents a very common form of gypsum crystals $P^{c}\infty$, (P), $\infty P(f)$, $P(l)$. The most common form of augite is represented in fig. 130, with the sign $\infty P(M)$, $\infty P^{o}\infty(r)$, $\infty P^{c}\infty(l)$, $P(s$

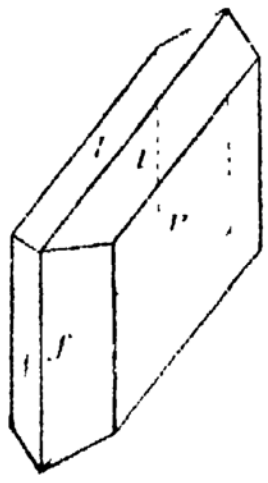

Fig. 129.

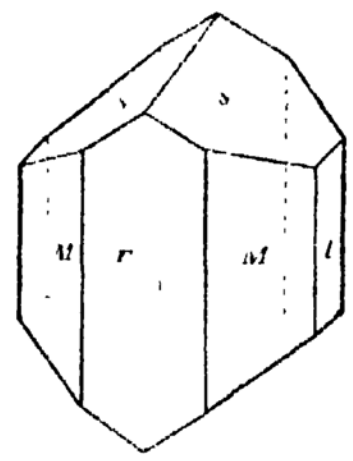

Fig. 130.

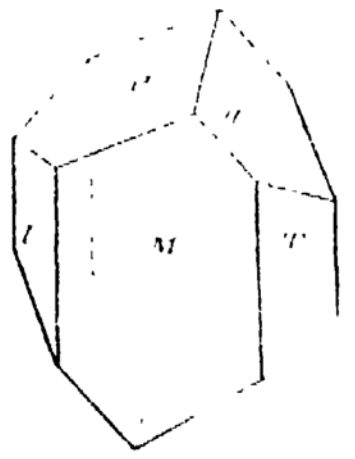

Fig. 131.

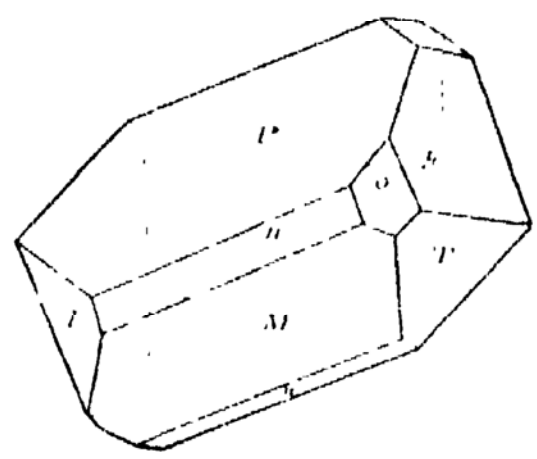

Fig. 132.

Fig. 131 is a crystal of common felspar or orthoclase, composed of the clinopinacoid $\infty P^{c}\infty(M)$, the prism $\infty P(T)$, the basal pinacoid $0P(P)$, and the hemidomes $2P^{c}\infty(y)$; to which, in fig. 132 of the same mineral, the hemipyramid $P(o)$ and the clinodome $2P^{c}\infty(n)$ are added.

VI. *Anorthic or Triclinic System.* This is the least regular system, and departs the most widely, indeed almost absolutely, from symmetry of form. The axes are all unequal, and inclined at angles none of which are right angles, so that, to determine any crystal, or series of forms, the proportion of the axes $a : b : c$, and also their angles or those of the inclination of the chief sections, must be known. As in the previous systems, one axis is chosen as the principal axis, and the two others distinguished as the macrodiagonal and brachydiagonal axes. In consequence of the oblique position of the principal sections, this system consists entirely of partial forms wholly independent of each other, and each composed only of two parallel faces. The complete pyramid is thus broken up into four distinct quarter-pyramids, and the prism into two hemiprisms. Each of these partial forms is thus nothing more than a pair of parallel planes, and the various forms consequently mere individual faces. This circumstance renders many triclinic crystals very unsymmetrical in appearance.

Triclinic pyramids (fig. 133) are bounded by eight triangles which lateral edges [illegible]. They are equal and parallel two and two to each other, each pair forming, as just stated, a tetartopyramid or open form, only limited by combination with other forms or, as we may suppose, by the chief sections. The prisms are again either vertical or inclined; the latter are named domes, and their section is always rhomboidal. In deriving the forms, the fundamental pyramid is placed upright with its brachydiagonal axis to the spectator, and the partial forms designated, the two upper by 'P and P', the two lower by ,P and P,, as in the figure. The further derivation now follows as in the right prismatic system, with the modifications already mentioned.

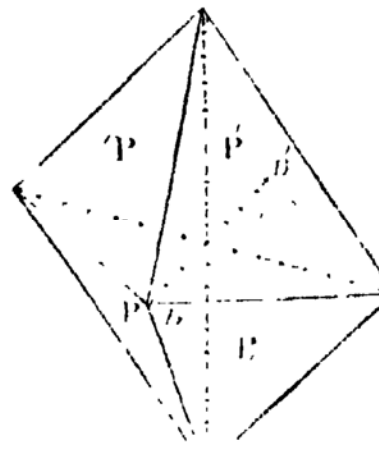

Fig. 133.

Some combinations of this system, as the series exhibited by most of the felspars, approach very near to the oblique prismatic system, whilst others, as cyanose and axinite, show great incon-

eteness and want of symmetry. In the latter case the determination of the forms is often difficult. In the oblique crystal (figs. 134, 135) *P* is the basal pinacoid 0P; *M* the brachydiagonal pinacoid $\infty\breve{P}\infty$; *r* the upper right pyramid P'; *l* the right hemiprism ∞l'; *T* the left hemiprism ∞'P; and *z* the hemidome 'P∞. Figs. 136 and 137 are crystals of axinite, the former from Dauphiné,

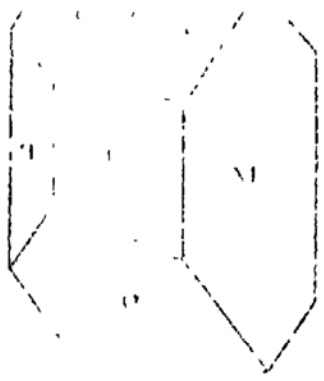

Fig. 134.

Fig. 135.

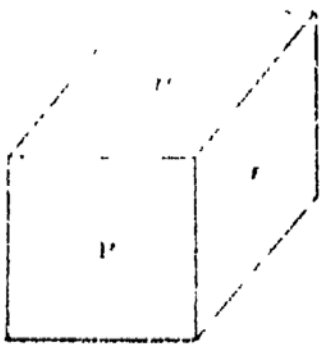

Fig. 136.

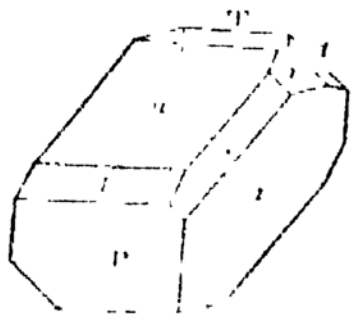

Fig. 137.

latter from Cornwall, of whose faces the following is the development: *r* the macropinacoid $\infty\breve{P}\infty$, *l* the left hemiprism 'P, *u* the left upper quarter-pyramid P, *f* the left upper quarter-pyramid 2P, *s* the left upper portion of the macropyramid P3, and *z* the hemidome 2'P∞.

The Measurement of the Angles of Crystals

The permanence of angular dimensions of crystals shows the importance of some accurate method of measuring their angles, that is the inclination of two faces to each other. Instruments for this purpose are called goniometers.

Two have been specially used for this purpose, the common or contact goniometer, invented by Carangeau, and the reflective goniometer of Wollaston. The former is simply two bars or rulers turning on a common centre, between which the crystal is opened until [illegible] and [illegible] rested on a graduated arc. [illegible] is then adjusted for many purposes, and for large crystals [illegible] goniometer is [illegible] smooth and even faces, but the faces may be very small, even of an inch or [illegible] small crystals are generally [illegible], far greater accuracy can be attained [illegible] goniometer is represented in fig. 138. It consists of a graduated circle *m n*, divided on its edge [illegible] most frequently into half-degrees, the minutes [illegible] estimated. This circle turns on an axis [illegible] by turning this the circle is moved [illegible] 180°, when moving in one direction, by [illegible] ment is intended to attach [illegible]. The two axes of motion [illegible] through it from *c*, so that [illegible] *f* to *z* can be turned without [illegible] required position; *f* is a [illegible] of *g*, a fourth axis, in the [illegible] all lies at *o*, to which the [illegible] crystal to be measured [illegible]. When about to be used, the [illegible] that its base horizontal [illegible] and opposite to a window [illegible] axis shall be parallel to [illegible] of the upper bar of the [illegible] west of the latter, a white [illegible] window, should then be [illegible] the observer places himself [illegible] bars, left hand. The crystal [illegible] wax, with the two faces [illegible] by the screws in its [illegible] lower distance, so that [illegible] bars of the window [illegible] for the lower bar or [illegible] rest or table parallel to [illegible] face adjust the crystal. [illegible] contact with the side *a* [illegible] held loosely by a piece [illegible] bent upwards, and the edge of union of the faces, including the angle to be measured, as nearly as possible in the line of *aa*. The eye being brought near to the first face of the crystal, the axes *aa* and *p* are turned till the image of the window is seen reflected in the face with the horizontal and vertical bars in their position. The axis *d* is then turned through a considerable angle (say 60°), and the image of the window again sought and brought into its proper place by turning the axis *f*, without moving *p*. When this is done that face is brought into its true position, normal to *d*, so that no motion of *d* can disarrange it. Hence the image of the window can now be sought in the second face and brought into its true position, with the horizontal bars seen horizontal, by moving the axes *d* and *a*. When this is done the crystal is properly "adjusted." The angle is measured in the following manner. Let a line [illegible] of the circle and vernier to coincide, and then turn the inner axis *a* or *c* and move the eye till the image of the upper bar of the window is reflected from the more distant face of the crystal coincides with the lower bar or horizontal line seen directly, keeping the eye in the same place, turn the other axis *f* till the reflected image of the upper bar in the other face in like manner coincides with the lower line, the angle of the two faces is then read off on the divided circle. As the angle measured is not directly that of the faces but of the rays of light reflected from them, or the difference between the angle wanted and 180°, the circle has the degrees numbered in the reverse direction, so as to give the angle without the trouble of subtracting the one from the other.

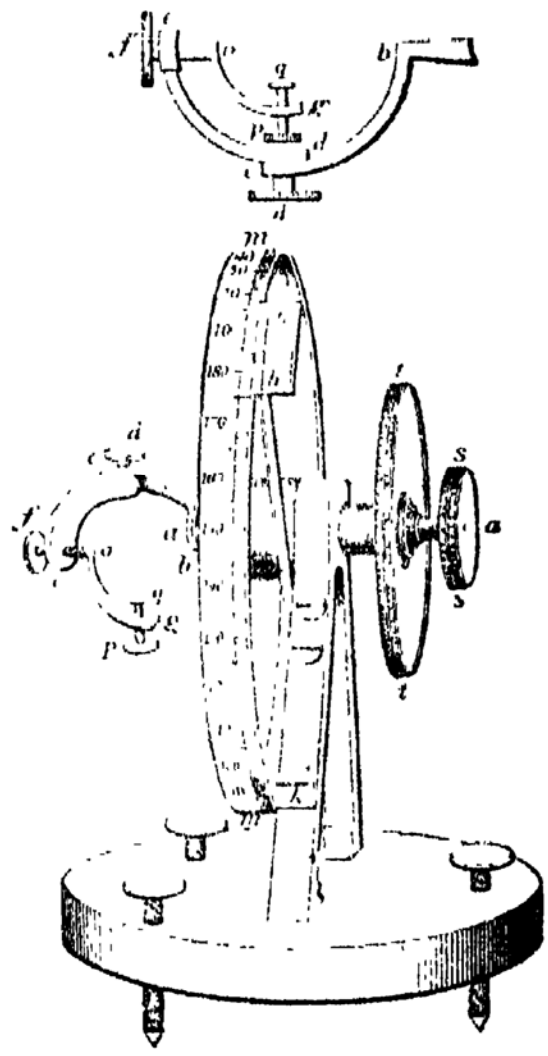

Fig. 138.

The apparatus figured is for adjusting the crystal, and is an improvement suggested by Naumann. In the original instrument the axis *a* was made to push in or out in a sheath, and had a small bent plate, bent at right angles, inserted in a cleft at *o*, to which the crystal was attached. The crystal was adjusted as formerly by moving the plate, or the axis *fa*, and by slight motion of the arm *z*, which bent at right angles nearly to *be* when used. A very marked improvement is to have a small mirror fixed on the stand below the crystal with its face parallel to the axis *aa*, and inclined at 45° to the window, when the lower line can be dispensed with, [illegible] instrument used for various other purposes of angular measurement. Many more perfect instruments have been introduced for the purpose of insuring greater accuracy; but the simple [illegible] trument is sufficient for all purposes of determinative mineralogy, and the error from the instrument will, in most cases, be less than the actual variations in the angles of the crystals.

Departure from Geometric Simplicity and Loss of Regularity in Crystals.

Such departures may be regulated by law, or may result from an undue operation of the force of accretion in certain directions.

1. *Regular Departures from Simplicity.*—There are three varieties of this: parallel groupings, twin forms, hemitrope [illegible].

Parallel Groupings. A plurality of individuals are here arranged either so that a line which joins their centres becomes a prolongation of one or other of their crystallographic axes, or so that their axes are parallel.

Fig. 20 shows the first, where cohesion sufficient for stability requires that the minute octahedra must mutually penetrate somewhat into each other. Fig. 139 shows the same in baryte. If we suppose octahedra united, the upper left-hand face of the one with the lower right hand face of the other, there would be parallelism of their axes. Re-entering angles would, in such cases, prove a plurality of individuals, but if a number of cubes were superimposed in similar position, no such angles would occur, an elongated square prism resulting; and such arrangements, if

repeated, are linear, or, with diminishing size in the individual, cicular.

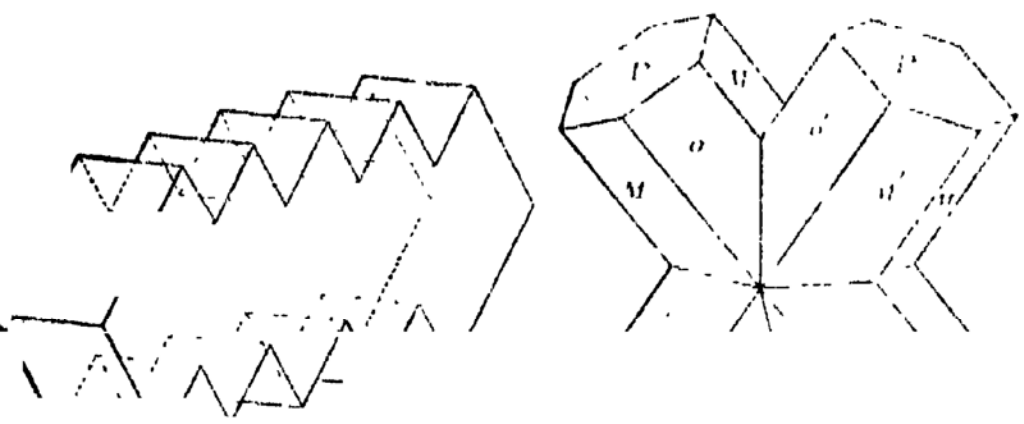

Fig. 139.

Twins and Hemitropes.—Though closely related termed under the operation of very similar laws, and to a certain extent passing into one another, there are not the In the first case a plurality of individuals must be pre ent, In the second this is not necessary In fig 140 two individuals evidently intersect one another, as figs. 141, 142 one individual may be supposed to have been bisected in a certain direction, and the two halves reattached, but in a position differing in some definite manner from their relative position before the separation

Fig. 141.

Fig. 142

There are four varieties of true twins, those of apposition, of intersection, of partial or completed interpenetration, and of incorporation.

The first is exemplified by spinel, as in fig. 143, the second by

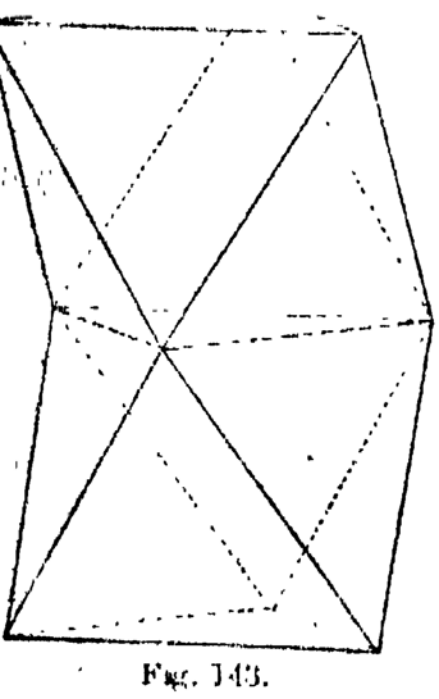

Fig. 143.

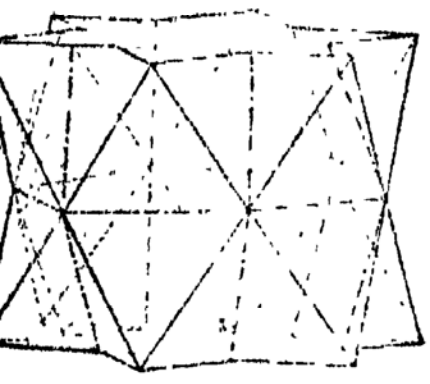

Fig. 145.

Fig. 144

Fig. 146.

staurolite, as in fig. 144; the third by calcite, as in fig. 146, and by blende, as in fig. 145, where the two individuals of fig. 143 may

be supposed to have been forced vertically into one another, and the fit made by quartz, as in fig 147.

The following are the laws of union of twins. 1. The face of union of twins, termed the "face of composition," must be either a plane which does occur in the mineral twinned, or which can occur in accordance with the fifth law of symmetry. A face

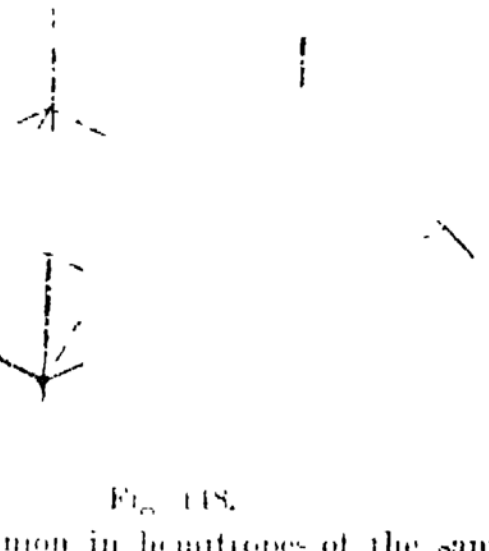

Fig. 148.

union in twins is also a face of union in hemitropes of the same mineral 2 From the above it results that the axes of the united crystals are either parallel (fig. 148) or inclined (fig. 149) The former generally occur among hemihedric forms and the crystals are combined in the exact position in which they would be derived from or would reproduce the primary holohedral form. The cases with enlargement occur both in holohedric and in hemihedric forms, and the two individuals are then placed in perfect symmetry, in accordance with

by having re-entering angles (fig. 150, 151), but sometimes the combined faces come to one plane, when the combination appears as a single individual (fig. 152, 153). The line of junction may then be imperceptible, or it may be marked by the same (fig. 154, 155) by one pe of the two fo

The formation of twin axial may be again repeated, forming groups of three, four, two When the faces of two crystals parallel to each other

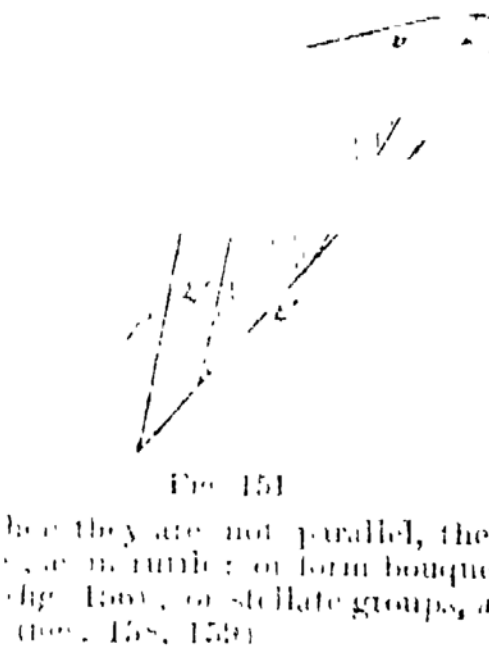

Fig. 151

rows of indeter may return into or rose-like group in calcite (fig. 2.

nt When they are not parallel, they re-circle, are in rumble; or form bouquet- ches (fig. 156), or stellate groups, a cross (figs. 158, 159)

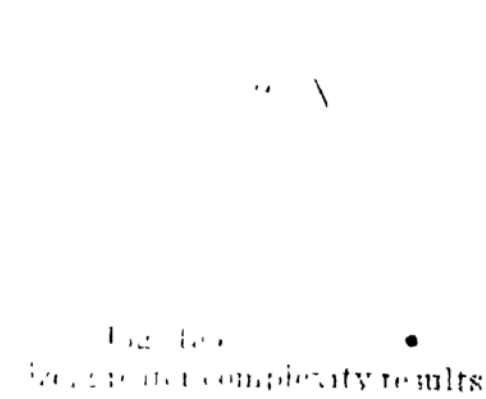

Fig. 152. Fig. 153

When the crystals are of different sizes the complexity results but a number of minute crystals are frequently arranged upon a larger at those points where the ends of the single large crystal would protrude. Occasionally a simple form is twinned with a more complex one, as in chabazite (fig. 160)

Hemitrope crystals we may imagine as having been formed from single crystal, which has been cut into two halves in a particular rection, and one half turned round 180° or 90°, or 60°. The ne about which the tion is supposed to take place is called he "axis of revolution." From the amount of turning usually being 180° [illegible] hemitrope. The position of the two

[illegible]

Fig. 157.

[illegible] halves in this case resemble that of an object and its image in a mirror, where either of them would represent the plane of reflection.

The following are the laws of hemitropes. The axis of revolution [illegible] possible crystallographic line, either an axis or a line perpendicular to an axis or a normal to a possible crystalline plane. The plane normal to the axis of revolution is called the twin plane, and is either an occurring or a possible face, and usually one of the more frequently occurring planes. [illegible]

Fig. 158.

[illegible] in relation to both halves of the crystal in them selves; consequently the part of hemitrope crystals are [illegible] which reference to the twin plane can be made in twinned crystals. The face of composition [illegible]

plane and the [illegible] position of the [illegible] angle to each other, the composition [illegible] parallel to the axis of revolution. But in the composition plane we have a disturbing influence [illegible] another, so that the plane of union is concealed or irregular. Still in these cases the axis and the plane of twinning retain a definite position, but the face of composition, being no longer defined, is [illegible] as a determinant.

Fig. 159.

Fig. 160.

There are three modes in which the composition may take place in hemitropes. These may be explained by dividing a crystal into halves, with the plane of division vertical, and then turning one of the halves round.

1. One of the halves may be inverted, as if by revolution through 180° on a horizontal axis *at right angles to the plane of section*, and the two faces again united by the surfaces which were separated. Here the surfaces of union are the original ones but the base of one of the halves has taken the place of its summit. Examples: selenite (fig. 161) and orthoclase.

2. One of the halves may be turned round through 180°, as if by revolution on a *horizontal axis, parallel to the plane of section*, and the two opposite and parallel to that of the plane of section an originally external face may then be applied to the other half. Here, not only has the base of one-half become a summit, but a lateral and external face of the original crystal has been thrust to its centre so as to become a face of internal union. Example: labradorite (fig. 162).

Fig. 161.

Fig. 162.

3. One of the halves may be turned round through 180°, as if by revolution on *a lateral axis*, parallel to the plane of section, the external face opposite and parallel to the plane of section becoming a face of union. Here, however, both the original summits retain their position as a summit. Example: orthoclase.

The last of the modes of composition may occur in each of the systems, but is not always apparent until disclosed by optical properties. The second is rare, and the third still more so.

In hemitrope crystals (besides frequently in true twins) the halves of the crystal are frequently reduced in thickness in the direction of the ordinary twin axis, and when there is a parallel repetition of hemitropes, which frequently occurs, they are often reduced to very thin plates, not the thickness of paper, giving to the surface of the aggregate a striated structure and appearance.

In the cubic system the faces of composition, both of twinning and of hemitrope revolution, are those of the cube, the dodecahedron, and the octahedron.

In the first case we have the axes of the two crystals necessarily in some cases parallel or, more correctly, falling into one, but, as in this system all the axes are alike, or all the cubic faces similar, composition may occur along or parallel to all alike, and double or triple twins occur. We have examples in twins of the pentagonal dodecahedron (fig. 163) made up by the interpenetration of a right

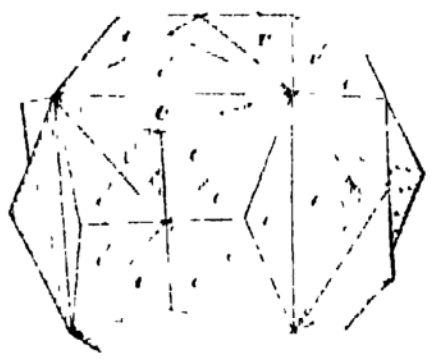

Fig. 163.

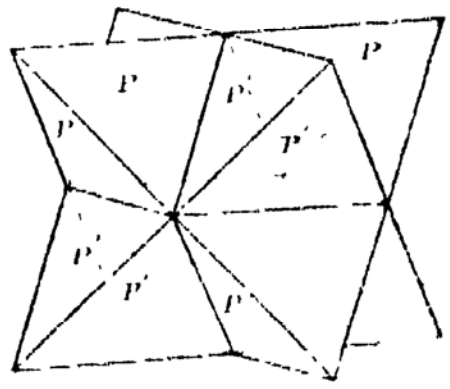

Fig. 164.

and a left (P and P'), and of the tetrahedron, as seen in pyrite and tabletz respectively. In virtue of the position required by law it will be seen that the position of the solid which is common to both intersecting crystals is in the twin of pyrite the four-faced cube, which is the holohedral form of the pentagonal dodecahedron, while in the case of the tabletz twin (fig. 164), the common portion is an octahedron, the holohedral form of the tetrahedron.

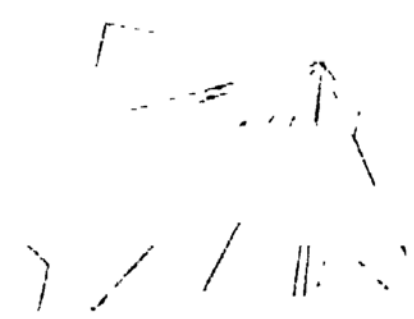

Fig. 165.

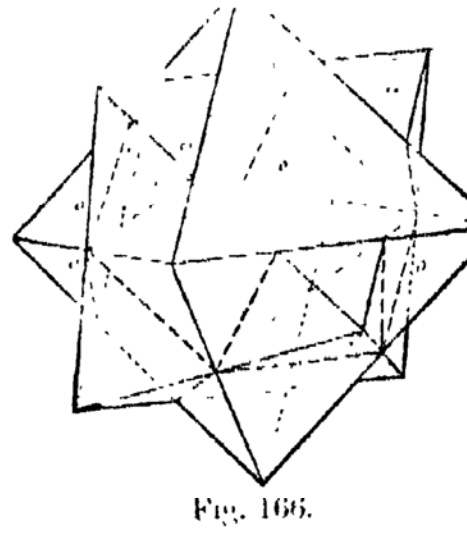

Fig. 166.

Twinning on an octahedral face is seen in the apposition twin spinel (fig. 133), the tetrahedral twin of blende (fig. 165), the interpenetrative octahedral twin of blende seen in fig. 166, and the intersecting cubes of fluor (fig. 167).

This is also the usual twin face for hemitropes of the cubic syste

is seen in fig. 168 of blende, where the two parts of the rhombic dodecahedron are united by it. Magnetite, spinel, and diamond

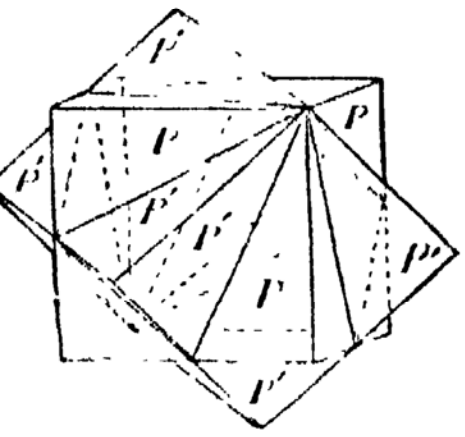

Fig. 167.

Fig. 168.

equently occur in octahedral hemitropes of the same composition g. 169).

This is also the face of composition for tetartohedral hemitropes ig. 170 is that of the diamond. Here six of the faces of the six-

Fig. 169.

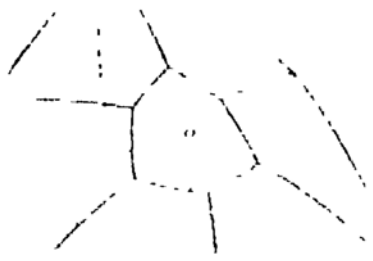

Fig. 170.

ded octahedron, with six faces diagonally opposite, form a low ouble six sided pyramid (a portion of an octahedral face truncating ach) through an 180° revolution of one set of the contained some mes shows both twins and hemitropes of the dodecahedron, of octahedral composition.

In the *tetragonal system*, twin crystals are very uncommon, but emitropes frequent. With parallel axes they very seldom occur, ut are seen in chalcopyrite. When the axes are inclined, the lane of union is usually one of the faces of the primary pyramid; nd, as these faces are all similar, composition may take place imultaneously parallel to all. Very complicated forms hence result, s seen in chalcopyrite and in cassiterite (fig. 171).

Fig. 171.

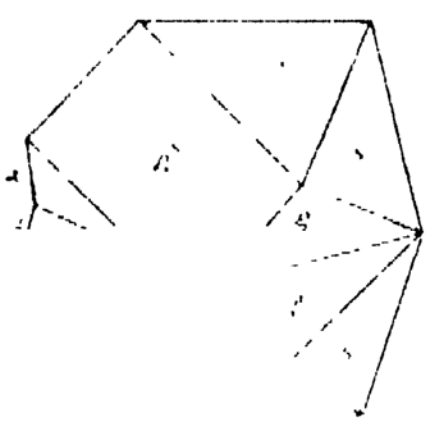

Fig. 172.

In cassiterite the plane of union is frequently one of the faces of the pyramid P∞, sometimes one of those faces that replace the polar edges of P (figs. 172, 173). From the bend the latter form is termed geniculated.

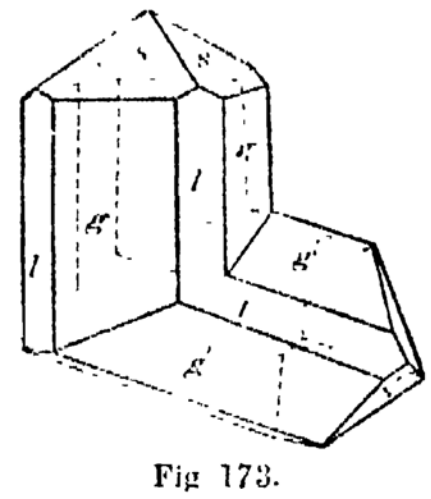

Fig. 173.

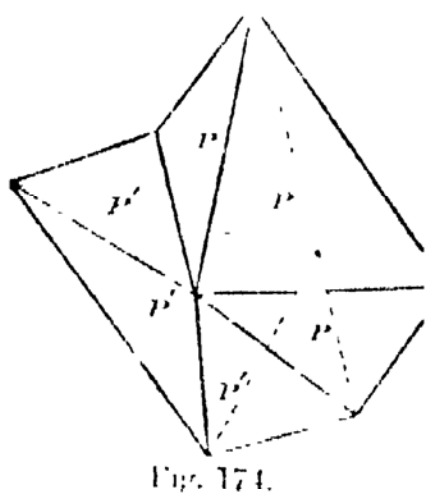

Fig. 174.

Hausmannite occurs in hemitropes of the primary P; and on the polar edges of this other twins are symmetrically repeated, a central individual appearing like a support to the others (figs. 174, 175).

In the *hexagonal system* twins are very common among the rhombohedral (the hemihedral) and the tetartohedral forms; while hemitropes prevail among the hexagonal or holohedral forms. The twins are generally formed by the interpenetration of two rhombohedrons, a + and a −, the vertical axis being the axis of composition; as in chabasite (fig. 176), cinnabar, levyne, calcite, &c. Sometimes six or more crystals, united parallel to the prismatic planes,

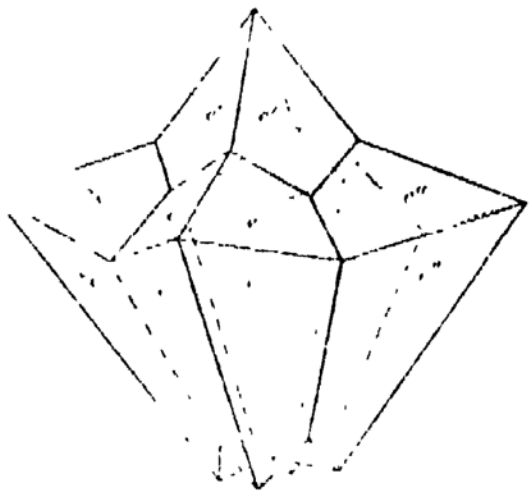

Fig. 175.

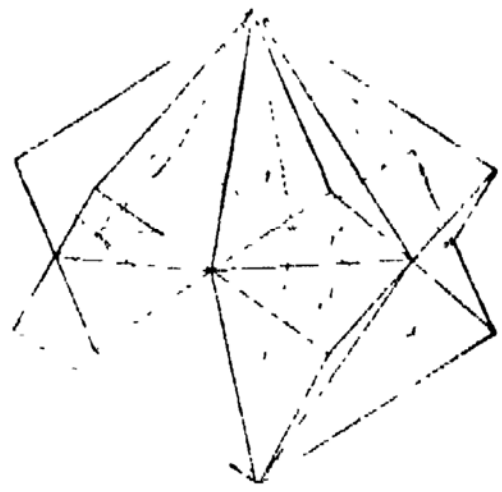

Fig. 176.

form rosettes, as in chabasite from Giant's Causeway. The almost endless stellate forms of crystals of snow are built up in this manner. Many of the most beautiful combinations to be seen among crystals result from this mode of arrangement.

Parallel grouping of hexagonal prisms also occurs, as in apatite (fig. 177).

Rock crystal in consequence of the tetartohedral character of its crystallization, exhibits twins in which the double hexagonal pyramid P may be said to be separated into two rhombohedrons. Parts of these, though geometrically similar, are physically distinct. In fig. 178 the two individuals have not entirely interpenetrated, and might be recorded as simply grown together with parallel axes, but in fig. 147 there is so complete an interpenetration that the composite character of the crystal is only evidenced through a difference in the character of the surfaces of the two halves, which are most irregularly disposed.

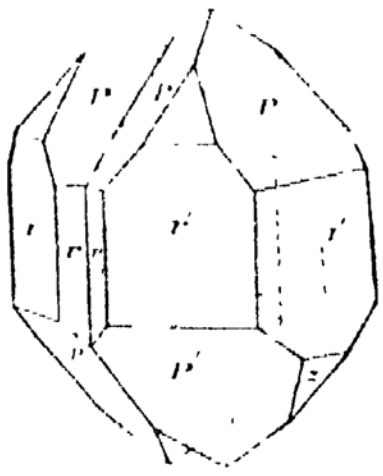

Fig. 178.

The hemitropes of this system often form regular crystals, when the two halves have been united by a plane parallel to the base, so as to appear like a simple crystal, as in fig. 179. Here each end shows the forms ∞R, −R, but the terminal faces appear in parallel instead of alternate position. Something of the same is seen in fig. 180, a hemitrope scalenohedron from Derbyshire. Hemitropes with the face of the primitive rhombohedron as the face of composition are also common, and they are sometimes joined by a face of −R; the two axes forming an angle of 77° 37′. Occasionally, a third individual is interposed in a lamellar form as in fig. 181, where the faces of the two outer parts are parallel. The pieces of isolated part. When the crystals occur in a face of the primary rhombohedron, they form an angle of 120° 0′ (supplement of 60°), recognized by the slight departure from a straight line in the reentering angles (figs. 182, 183).

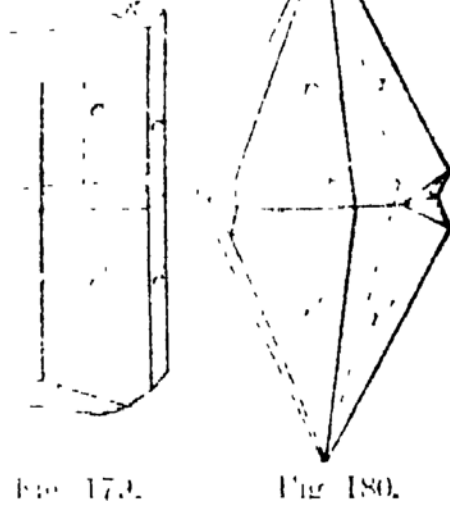

Fig. 179.

Fig. 180.

Fig. 181.

The faces of the hexagonal pyramid P are the faces of composition most commonly observed; other examples are figs. 142, 146, 148, and 149.

In the *orthorhombic system* twins are rare, with parallel axes are rare but with oblique axes common, the face of union being one of the faces of the prism ∞P. Twins of this kind are frequently in

ragonite, cerussite, witherite, and marmolite. In aragonite the crystals are partly in interpenetration, and partly merely in juxtaposition, as in fig. 191, where the individuals are formed by the

Fig. 191.

combination ∞P.∞P∞.0P, ∞P.∞P∞.P, ∞P.0P. In fig. 185 crystals of the same combination form a series with parallel planes of union, the inner members of which are often so shortened that they form

of the two halves of the simple crystal represented in fig.

130 are in fig. 191 united so perfectly and symmetrically that the line of junction cannot be observed on the clinopinacoid. The two hemipyramids (s) (like - P7) in the gypsum crystal) form at one end of the crystal a re-entering, at the other a salient angle

Fig. 190.

Fig. 191.

Hornblende (fig. 192) and wolfram exhibit a similar appearance. This results in the imparting a pseudo-heteromorphism to certain oblique prismatic twins, which is well seen in the twins of sphene (figs. 195 and 589), and in exalting the character to the appearance of true hemimorphs, as seen in the twin of acmite (fig. 194). In other cases the individuals partially penetrate each other in the direction of the orthodiagonal. This mode of union is not uncommon in gypsum, and is very frequent in orthoclase. Two crystals

Fig. 193.

of the latter of the combination (∞P∞), ∞P, 0P, 2P∞, as in fig. 131, are often pushed into each other, as shown in fig. 195.

In the *anorthic system* twin formations are of great importance, e.g., as a mean of distinguishing the triclinic from the monoclinic species of felspar. In one variety the twin axis is the normal to the brachydiagonal chief section. But in the anorthic felspars this section is not perpendicular to the base, and consequently the two bases form on one side a re-entering, on the other a salient angle; whereas in the oblique prismatic felspars (where the brachydiagonal chief section corresponds to the clinodiagonal) no twin crystals can be produced in conformity to this law, and the two bases fall in one plane.

Fig. 194.

Fig. 195.

Albite and oligoclase very often exhibit such twins as in figs. 196, 197, where the very obtuse angles formed by the faces of 0P, or *P* and *M* (as well as those of ∞P∞, or *x* and *x'*), are a very characteristic appearance, marking out this mineral at once as a triclinic species. Usually the twin formation is repeated, three or more crystals being combined, when those in the centre are reduced to mere plates. When very numerous, the surfaces *P* and *x* are covered with fine striæ, often only perceptible with a microscope. A second law of twin formation is observed in triclinic felspars, particularly in albite and labradorite

is that the twin axis corresponds with that normal of the brachydiagonal which is situated in the plane of the base. In pericline, a variety of albite, these twins appear as in fig. 195, where the two crystals are united by a face of the basal pinacoid *P*, whilst the faces of the two brachypinacoids (*M*

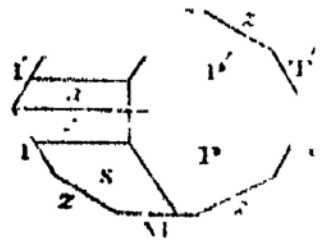

Fig. 196.

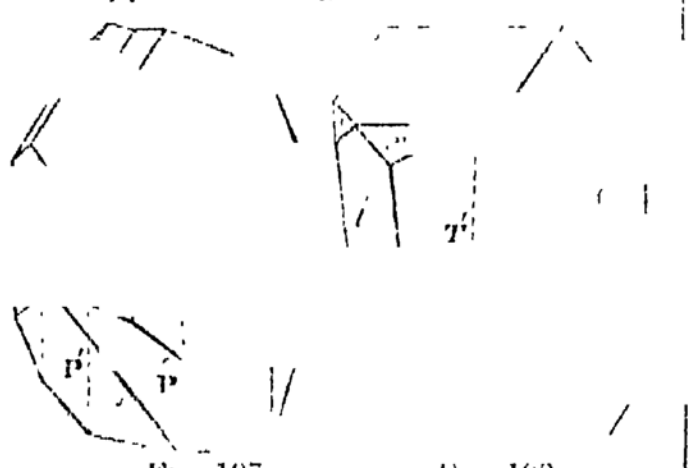

Fig. 197.

Fig. 198.

and *M'*) form edges with very obtuse angles (173° 22'), re-entering on the one side and salient on the other. These edges, or the line of junction between *M* and *M'*, are also parallel to the edges formed by these faces and the base, or those between *M* and *P*. In this case also the twins are occasionally several times repeated, when the faces appear covered by fine striæ.

Cause of the Formation of Twins and Hemitropes.—It has been shown above that the relative position of the molecules of a crystal is determined by a polarity in the molecules themselves. The polarity must exist along three lines which intersect in the centre of the molecules; and unlike poles must attract each other. It has been supposed that compound crystals result from a reversion of the original polarity of the molecules of a crystal, after it has attained a certain size. Heat and electricity, or minute tremor movements in strata, might occasion such reversal during the formation of a crystal, and this would suffice for the explanation of hemitropes, though not directly of geniculated crystals, and still less of intersecting twins. Twins have accordingly been divided into

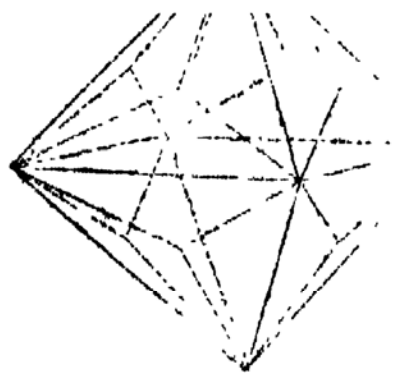

Fig. 199.

The first term is applied to the ordinarily occurring twins in which the component structures are supposed to have had their normal molecular, or to have been compound molecules, or to have been compound in structure from the first. In metagenetic twins, the crystals were at first simple, but afterwards, through some change in the matter returned before its mineral species finally induced it itself, it received new layers, or its extension *in a reversed position*

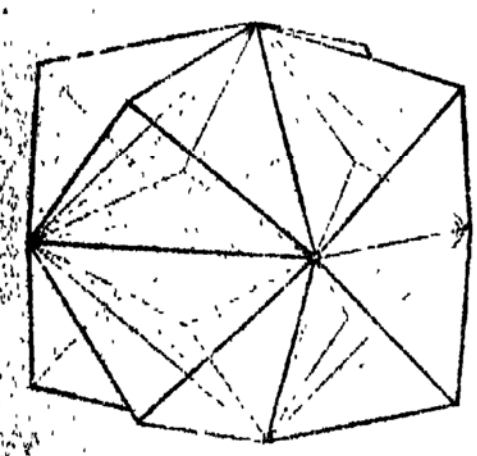

Fig. 200.

Fig. 202.

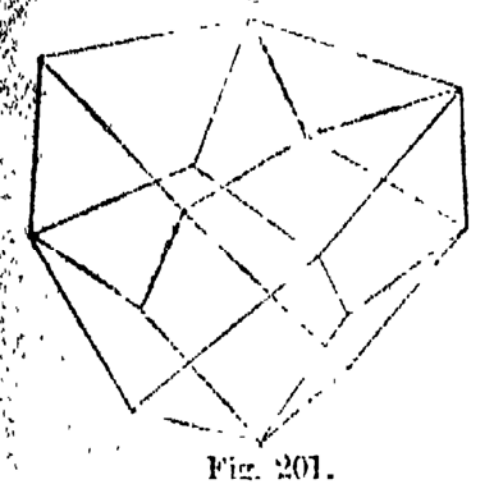

Fig. 201.

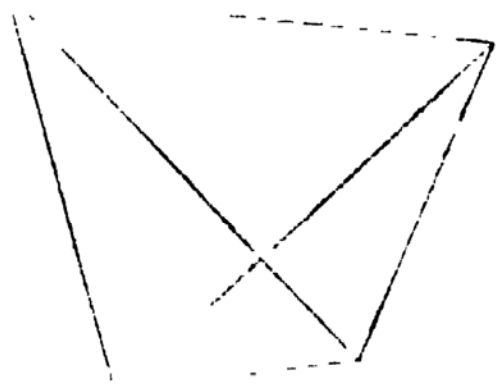

Fig. 203.

Rutile occurs in crystals like fig. 173, but with a bend at both extremities, instead of one only. Here the middle portion of the crystal is supposed to have attained a length of half an inch, and then it became geniculated simultaneously at both extremities; indeed, in this manner such geniculations are frequently repeated until the ends are bent into one another, and produce short hexagonal prisms with central depressions or even cavities. This repeated twinning which produces striation, as in calcite and the felspars, and the peculiar rippled structure of amethyst, are ascribed to a similar operation, acting in an oscillatory manner.

Certain intersecting twins in the cubic system may be explained simply through excessive or undue accretion of molecules along certain lines. At page 351 it was shown how the three-faced octahedron (fig. 39) was formed through an accretion of molecules upon the faces of the octahedron along a line joining the centres of its faces (those which connect the solid angles of the cube). It was also shown that when through the accretion two faces of the triakis octahedron (fig. 199), adjacent along the edge of the octahedron, rose into one plane the rhombic dodecahedron resulted. If now accretion still goes on along the same axes, so that the trihedral pyramid rises above the level of the dodecahedral planes, fig. 204 results. This is the twin of the three-faced tetrahedron (fig. 201).

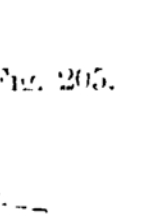

Fig. 204.

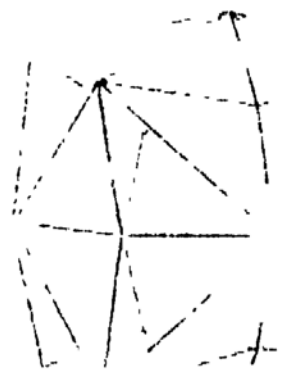

Fig. 205.

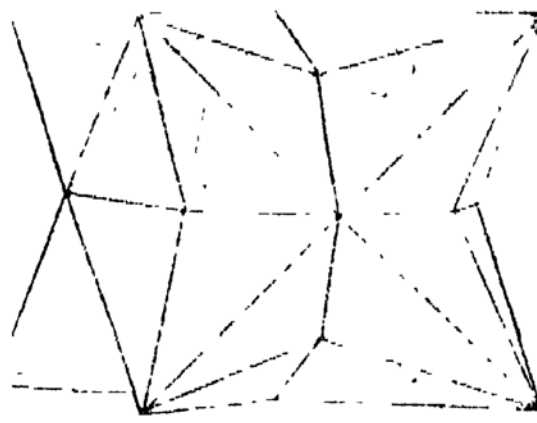

Fig. 207.

Fig. 206. Fig. 208.

If the accretion be still along the same axes, so that the inverted edges of the adjacent pyramid fall into the same line, this is the twin of the simple tetrahedron (fig. 201). Here accretion upon the faces of a complex holohedral form has produced a twin of a simple hemihedral form.

Again, starting from the three-faced octahedron (fig. 204) there is produced by the same process first fig. 205, the twin of the six-faced tetrahedron (fig. 206), and ultimately fig. 207, the twin of the three-faced tetrahedron (fig. 208).

2. Departure from Regularity or Normal Accretion in certain Directions. Distortion of Crystals.—The laws of crystallization should produce crystal forms of perfect symmetry; the laws, however, are subject, not only to the influence of other laws, but also frequently to disturbing influences which are subject to no law. Absolute symmetry, therefore, is very uncommon, crystals being generally more or less distorted and disguised through interference during their formation that either familiarity on the one hand or killed on the other is necessary for their recognition. The parameters of the angles may vary somewhat, even the colour may sometimes perplex. Hence it is necessary to be familiar with such departures from symmetry as some of the more common are here noticed.

In the cubic system a cube (fig. 209), lengthened or shortened along one axis, becomes a right square prism (fig. 209), and elongated in the direction of two axes changes to a rectangular prism (fig. 7). Cubes of pyrites, galena, fluor-spar, &c., are generally thus distorted. It is very unusual to find a cube crystal that is a true symmetrical cube. In some species the cube or octahedron (or other monometric form) is [illegible] of into a capilla-

rystal or needle, as happens in red copper and pyrites. Crystals acicular pyrites occur at the Newton Stewart lead-mine

An octahedron flattened parallel to two of its faces is reduced to tabular crystal (fig. 210). If lengthened in the same direction, takes the form fig. 211, or if is still further lengthened, to the blitération of two opposite octahedral faces or become an

Fig. 210.

Fig. 211. Fig. 212.

ents this prism lying on it acute edge (spinel, fluor magnetite) The dodecahedron when lengthened in the direction of the upright axis become a square prism with pyramidal summits (fig. 13); and when shortened along the same axis it is reduced to square octahedron with truncated basal angles (fig. 214). Bot

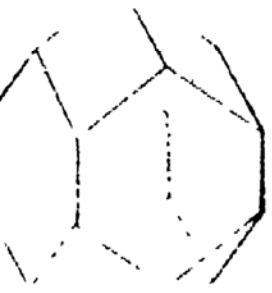

Fig. 213.

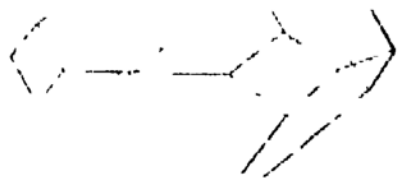

Fig. 214.

Fig. 215.

e forms are modifications of the square prism; the first mode distortion is common in garnet, rendering it liable to be con fused zircon, the second is seen in apophyllite, when it might be taken

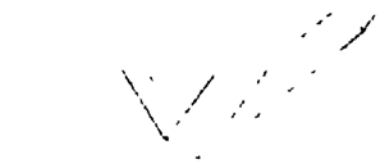

Fig. 217.

When first of these forms is flattened, as in fig. 215

When a dodecahedron again is lengthened along a diagonal of two opposite hexahedral angles, it becomes a six-sided prism with trihedral summits, and if shortened in the direction of the axis a rhombohedron which has its edges truncated

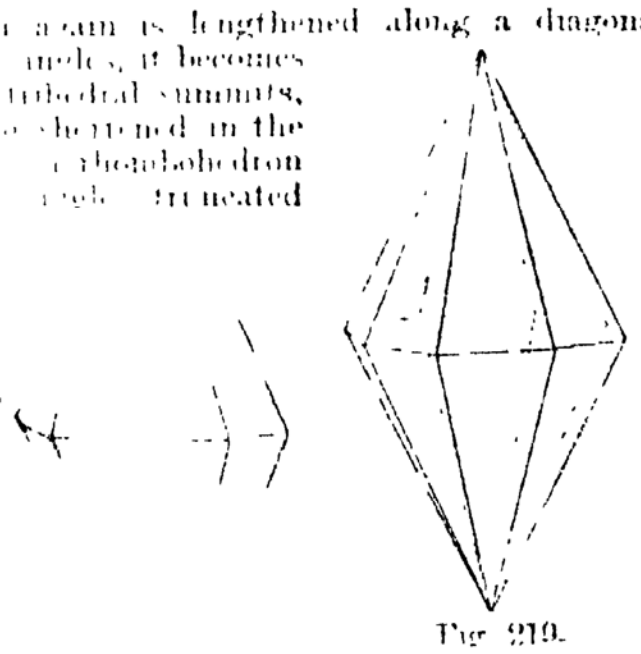

Fig. 219.

ase, a crystal of this form placed on one of its truncated summits could resemble the crystal of the latter, a hexagonal garnet would resemble calcite.

The trapezohedron is exceedingly subject to distortions which frequently disguise it until When elongated in the direction of the upright axis it becomes a double eight-sided pyramid with four-sided summits, fig. 218; a further elongation along the same axis would result in the obliteration of these summit faces, and in the production of a perfect double octagonal pyramid (fig. 219). The first of these distortions is exceedingly common in analcime and nos

Fig. 220.

Fig. 221.

uncommon in garnet, the latter rarely occurs in analcime. Lengthened along an octahedral axis it becomes fig. 220; shortened along the same it becomes fig. 221. Both are seen in analcime.

When the tetrakishexahedron is lengthened along a single octahedral axis it assumes the form of fig. 222; still further elongated with obliteration of one half of its planes, it becomes a scalene dodecahedron, resembling the "dog tooth" form of calcite (fig. 223). Fig. 224 is a hemihedron of this form, produced by shortening along an octahedral axis, with obliteration of all the planes which do not touch the poles of that axis.

In the case of modified crystals of this system the distortions are more complex. Fig. 225 represents a crystal of cinnamon stone from Aberdeenshire; it is a combination of the dodecahedron and the trapezohedron. Only four dodecahedral faces remain (*d*), and those of the trapezohedron (*n*) are of unequal size. It may be best understood by regarding it as fig. 218 with the four vertical faces of fig. 213, so that it combines the distortions of both of these figures.

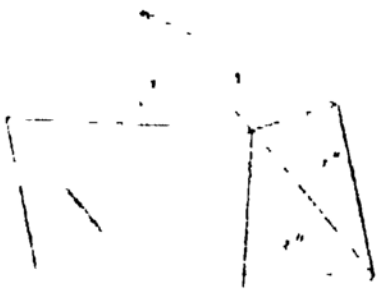

Fig. 224.

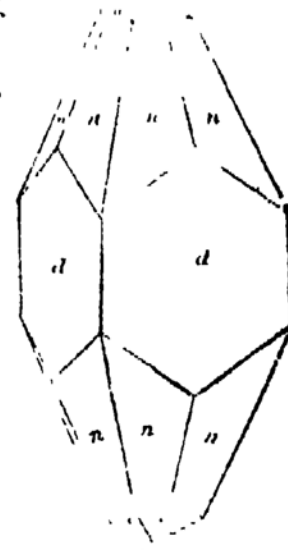

Fig. 225.

Crystals of diamond are very frequently distorted, though generally through curvatures of their faces.

Imperfections in the Surfaces of Crystals.

Of these the most important are striæ, caverns, and curvatures.

1. *Striated Surfaces.* The parallel furrows on the surfaces of crystals are called striæ, and such surfaces are said to be striated.

Each ridge on a striated surface is enclosed by two narrow planes. These planes often correspond in position to a secondary or to the primary planes of the crystal, and we may suppose these ridges to have been formed by repeated oscillation in the operation of those causes which gave rise, when acting uninterruptedly, to larger planes. By this means the surfaces of a crystal are marked in parallel lines with a succession of narrow planes, meeting at angles alternately re-entering and salient, and constituting the ridges referred to. This combination of different planes in the formation of a surface has been termed an oscillation of faces.

Cubes of pyrites are generally striated in such a way that the striæ on adjacent faces are at right angles to one another. These lines are parallel to the intersections of the primary faces with the planes of the pentagonal dodecahedron, which is the most common form of pyrites; and they have evidently resulted from an oscillation between the primary and this secondary form.

The rhombic dodecahedron is often striated parallel either with the

edges, or with the longer or the shorter diagonal of its faces. In the first case, seen in garnet (fig. 226), there is a passage into the six-faced octahedron; the second results from an oscillatory combination of the dodecahedron with the regular octahedron, as in magnetite; and the last with the cube, as in aplome.

Rhombohedrons of chabasite are often striated parallel to the

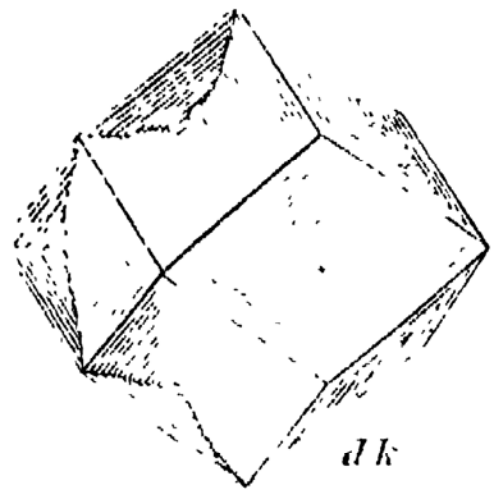

Fig. 226

terminal edges (fig. 227), indicating an oscillatory combination between the primary faces and a secondary plane which bevels these edges.

Striation of faces is more frequent in the rhombohedral system than in any of the others. Horizontal striæ are of almost invariable occurrence in the prismatic faces of quartz, whatever be the form of the crystal. The oscillation here has taken place between the pyramidal and the normal faces (figs. 228, 229, 230). During its growth there seems to have been a continued effort to complete the crystal by the assumption of the terminal planes, which effort was intermittently overcome by a preponderating one to continue the deposition of matter along its main axis. Quartz crystals, from these alternate efforts, often taper to a point, without having any regular pyramidal face.

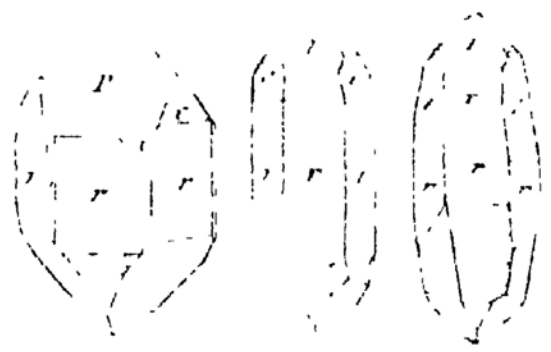

Fig. 228. Fig. 229. Fig. 230.

The lateral planes of prisms of tourmaline are very frequently convex, owing to oscillation between several lateral faces. In all such cases the interfacial angles cannot be determined, as they are lost in the rounding.

The striations on the lateral faces of foliated mineral are merely the edges of lamination. Examples: mica and gypsum.

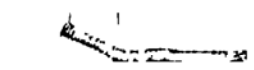
2. *Cavernous Crystals.* Crystals not unfrequently occur with a deep pyramidal depression occupying the place of each plane, as is often observed in common salt, galena (fig. 21) and sulphur. In the solution of crystals through atmospheric exposure, an approach to the same form is sometimes obtained, owing to the fact that the centres of the faces yield sooner than the edges and angles. Crystals of redruthite are often thus cavernous. Sometimes octahedrons occur with a triangular cavity, in place of each face (fig. 223). The same is met with in other forms.

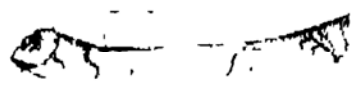
3. *Curved Surfaces.*—Curved surfaces sometimes result from the oscillatory combination already noticed. Others result from a curvature in the laminæ constituting the crystal. Crystals of diamond have convex faces, and are sometimes almost spherical. This mode of curvature, in which all the faces are equally convex, is less common than that in which a convex surface is opposite and parallel to a corresponding concave surface. Rhombohedrons of spathic iron and pearl spar are usually thus curved, as is shown in fig. 231. The saddle-shaped crystals of the same mineral (fig.

Fig. 231. Fig.

232) are remarkable instances of several reversed curvatures in the same face. A singular curvature is shown in fig. 233, of calcite. The conical crystals of brown zinc blende, and the lenticular and conical crystals of gypsum, are other examples. Crystals of quartz are sometimes curved and twisted. When this takes place in the left-handed and right-handed crystals, the twist is to the right or left according as the crystal is right or left handed.

The surfaces of crystals are frequently far from flat, on account of fracture, with dislocation of the several fragments, occasioned by motion in the enclosing rock, the material of which is forced, or may be transfused, into the rents. The tourmalines and beryls (fig. 234) which occur in granitic dykes are very subject to this, the fragments being often bent as well as displaced. A more or less momentaneous effort in the crystallization of two substances may produce a structure with the external form of one, the interior of which exhibits imbedded crystals of the other more or less perfect in their development. In pegmatite or graphic granite, rude crystals of feldspar contain skeleton forms of quartz, of which generally only one side of the prism and two of the pyramid occur, forming a roofed letterne. Similar hollow quartz forms occur imbedded in garnet, radiating from its centre (fig. 235), and touching the surface from protrusion, without distorting its form. Totally imbedded microscopic crystals, "microliths," are, as in the latter cases, chem-





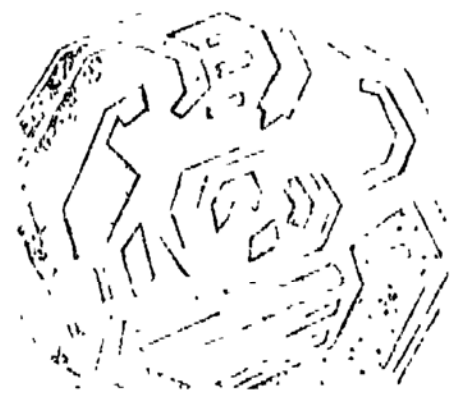


Fig. 234 1

cally non-assimilable. These are frequently arranged in layers in the including crystal, as in aventurine and leucite. When there is a certain amount of chemical resemblance there may occur definiteness in the arrangement, and if the enclosed substance crystallizes in a system different from that of the mineral which

includes it, the angles of the latter are more or less distorted. This is the case in "micropegmatite," where the intermixture of plagioclase feldspar causes one departure from the rectangularity of orthoclase. Foreign amorphous matter brought up on the faces as they grow to the surface of a crystal, decreases the power of that crystal to cohere, and forms a feeble cohesion. Even in the case of a good specimen of quartz there is an occasional shrivelled appearance on the crystal faces to which the foreign matter adheres, seeming to indicate that it has been to some extent under the influence of a polarity in attraction. Something of the same kind seems to have influenced the arrangement of the quartz grains caught up during the formation of the crystal of garnet shown in fig. 236. The perfect modelling of rock crystals is, however, but rarely interfered with by the almost countless substances which they contain.

Aggregation of Crystals

Crystalline aggregates, which pass into amorphous masses, may, in their more marked or perfect form, be referred to an imperfect twinning.

Crystals are often grouped in linear series, as in native copper and silver, and thus constitute lines, threads, or reticulations. In clustered crystals these adjoining each other are generally parallel in position, and are united by a plane parallel to one of the principal forms, or to planes of common occurrence. Senarmont mentions a union in galena

parallel to the octahedral faces, as common; and he also describes an instance where the union was parallel to the plane $3\breve{3}$.

The position of crystals on the supporting rock seem at first to be without [illegible] But by close inspection we detect even here the [illegible] harmony that governs the formation of the simple and compound crystal. The various relations assumed correspond to those of the more common kind of composition in twin crystals [illegible] of the irregularity produced in each on account of the unevenness of the surface on which it is set. In general, however, [illegible] with crystals a reflexion [illegible] with reflexions from the [illegible] showing that the crystals [illegible]

[illegible] [illegible] or spotted [illegible] [illegible] one after the other [illegible] [illegible] with [illegible] [illegible] [illegible]

econd in some varieties of specular iron, of the last in chalcedony, pal, and other species.

The above terms are indefinite, but of necessity, as there is very degree of fineness of structure in the mineral species, from erfectly impalpable, through all possible shades, to the coarsest granular. The term phanero-crystalline has been used for varieties n which the grains are distinct, and crypto-crystalline for those n which they are not discernible without the aid of a lens. Granular minerals, when easily crumbled in the fingers, are said to e friable.

The minute or crypto crystalline minerals form aggregates some what similar to the above. When globular or oolitic, the ndividual crystals often appear to radiate from a centre, or form concentric crusts. These are often globular or nodular, as in dolomite, and some what similar are the stalactites and stalagmites, or whatever mineral (especially rock-salt, calc spar, malachite, hematite, limonite) has been deposited from a fluid dropping down from some overhanging body, or some rent in the roof of a cavern. In this case there is generally found a long pendent cylinder or cone, the principal axis of which, generally hollow, is vertical, but the marginal parts are arranged at right angles to it, except where they curve round the termination of the tube, which is usually hemispherical.

By far the largest masses of the mineral kingdom have, however, been produced under conditions in which a free development of their form was excluded, and are termed amorphous. The rock masses, as with the greater portion of the minerals composing veins filling veins and dykes. The structure of these masses, on a small scale belongs to geology, but some varieties of the texture, even in hand specimens, may be noticed. The individuals of rock masses have seldom any regular form, but appear rounded or flattened, according to circumstances, and are frequently found interlocked in the process of formation. Even then, however, a certain regularity in the position of the parts is often observable, as in graphic granite, where the axes of the skeleton crystals of quartz are parallel. The rock is termed massive when the crystals of which it is composed are small, or granular when they are larger and more distinct. Sometimes the rock becomes slaty, breaking into thin plates; or concretionary, forming rounded masses, as if the result of the interposition of some foreign substance (water or vapour) which has rendered it porous, cellular, or vesicular, giving rise to drusy cavities. These cavities are often empty, but have occasionally been more or less filled by products of change in the rock. It is named amygdaloidal when the cavities are filled by a mineral in the form of an almond.

Changes of Crystalline Structure

"Pseudomorphs" are minerals which appear under a form of crystallization which does not belong to the species. They may be recognized either by their having no cleavage, which is most usual, or by their cleavage being altogether different in direction from that of the mineral imitated. Generally they have rounded angles, rough and dull surfaces, and when broken show a granular structure. The faces of the crystal, moreover, are often covered with minute crystals of a form different from that of the mineral imitated, but which is that belonging to the substance now present. Occasionally the resemblance to real crystals is so perfect, from the perfect polish of the faces, that they are distinguished with difficulty. They may be frequently found still undergoing change.

Pseudomorphs have been classed under four heads:

1. *Pseudomorphs by Alteration.* Formed by a gradual change of composition in a species. Of these there are two varieties: they may be pseudomorphous by loss of an ingredient or by addition of an ingredient; change of augite to steatite is an example of the first, and of galena into anglesite is one of the second.

2. *Pseudomorphs by Substitution.* Those formed by the replacement of a mineral which has been removed, or is gradually undergoing removal; *e.g.*, galena takes the form of pyromorphite.

3. *Pseudomorphs by Incrustation.* Those formed through the incrustation of a crystal, which may be subsequently dissolved away. Often the cavity is afterwards filled by infiltration, *e.g.*, change of fluor to quartz.

4. *Pseudomorphs by Paramorphism.* Those formed when a mineral passes from one dimorphous state to another; *e.g.*, change of aragonite to calcite.

These different kinds of change are not always distinguishable. In some cases a change may take place through alteration of the surface, and then, this process ceasing, the interior may be dissolved out, leaving a pseudomorph like one of incrustation; or a pseudomorph that appears to be a result of mere chemical alteration may be wholly due to substitution simply.

Again, changes of scapolite to a felspar and of augite to uralite (hornblende), have been considered by Scheerer examples of paramorphism,—scapolite being considered dimorphous with common felspar, and augite with hornblende. But, while such paramorphic changes undoubtedly take place with aragonite, their occurrence in these silicates—which are common associates in the same rock, and must have been formed under like circumstances—is hardly probable.

Where mineral bodies have taken the form of organisms, it is more a case of molecular replacement than of true pseudomorphism.

Paramorphism should be understood, however, to consist, not simply in alteration of crystal, but in every instance of change in mass of rock. Thus all serpentine, whether in mountain masses or in simple crystal, has been formed through a process of pseudomorphism or, in more general language, of metamorphism of some previous rock. The same is true of other massive rocks, as granular talcose and chlorite slates. The crystalline rocks often offer example of a change similar in nature. The graphite of these rocks is probably but a metamorph of some vegetable organism. Thus the subject of metamorphism, as it bears on all crystalline rocks, and that of pseudomorphism, are but branches of one system of phenomena, the geometry of both is the same, and a knowledge of each throws new light on the other.

The common change of peroxide of iron, from the loss of its water of the upper part of metallic lodes is produced by the [illegible] of the [illegible] of the process [illegible] protoxide [illegible] saturated after [illegible] trace of per[illegible] pyrites become [illegible] the same. Arseniates, vanadates, and arsenites of lead, &c., as well as carbonates and sulphates, are among the latter species, or those that occupy the upper part of metallic lodes, these are the result of alteration within those depths to which atmospheric agencies penetrate.

Pseudomorphs are always records of past existence, and in some cases they may be the only evidence we possess of such prior existence. Figs. 238, 239 are pseudomorphs of quartz or boracite after datholite, the measured angles of the crystal show that the imitated crystal was datholite, but that mineral does not now exist in any of either of these forms.

Fig. 238.

The process of pseudomorphism [illegible] of ores, lodes [illegible] a species of pseudomorphic [illegible] formation, and [illegible] a process [illegible] with the above remarks. External and internal [illegible] rather [illegible] mineral which [illegible] even the most [illegible] the different [illegible] fied mass [illegible] position [illegible] tinctness of the [illegible] Different from the original [illegible] portion [illegible] the [illegible] the [illegible] [illegible] been replaced [illegible] [illegible] towards the external [illegible] [illegible] [illegible] [illegible] pseudomorphic changes are also [illegible] [illegible] carbonates, bismuthite, and [illegible] often become very regular [illegible] detected account of the ligneous [illegible] perfectly observable [illegible] mineralized bodies, in which the [illegible] not their chemical nature [illegible] complete series may be often traced [illegible] through the variety of brown coal [illegible] opale

Causes and Character. The causes of [illegible] are the simple and most universal operation [illegible] process or general alteration to which [illegible] liable on account of the presence of [illegible] and carbonic [illegible] ment in the atmosphere, and the reactions [illegible] formed on adjacent ingredients [illegible] promoted by electrical currents or by heat, [illegible] the [illegible] of power of ordinary waters, cold or hot, or of [illegible] to reaction [illegible] in accordance with chemical principles [illegible] of the ingredients

di solved in these waters, or in mineral or sea waters, heated or at the ordinary temperature (4) the action of gases exhaling from the earth (5) change referable to volcanic action.

Ordinary water-formation acts well known, more or less of mineral matter. When water containing carbonic acid is passed through a finely-powdered or recently-ground minerals, it gives evidence of the presence of one or all of lime or magnesia; and some of the mineral even the softest even with the first drops. Perfectly pure water, free of them, will dissolve minute quantities of them, but more slowly. Rain-water, containing only about one-thousandth of its volume of carbonic acid, is capable of dissolving about one-fifth part per cent. of the whole mass. The lime, magnesia, and alkalies appear in the condition of carbonates, and the proportion from the state of carbonate to that of peroxide of iron is quite as great. The minerals of the most basic lime, and many of them readily yield to the action. Silica, however, is more readily than in carbonated water.

The above seems to two important points: (1) that ordinary water, free of acid, and filtering through the earth's crust are capable of dissolving and decomposing mineral and rock matter to a great extent, and (2) that the water thus impregnated with mineral matter is thereby fitted to act chemically upon, and alter, the water and thus transform them into other chemical forms. The water penetrates all rocks, as well as percolates through soil. Hence the action is universal, going on everywhere, and the result an universal deposit of lime, shell, coral, and animal remains, generally as a source of carbonate of lime, phosphate, and fluorides, and plant ashes contribute also potash and soda, and sometimes silica.

Carbonic acid is a constituent of the atmosphere, and is dissolved by the rain as they descend, hence the active decomposing agent present in all ordinary water, but it is also a result of different mineral changes. Sulphuric acid, along with vegetable matter, owes its origin to the decay of the vegetable matter, and the product carbonic acid and peroxide of iron. The quantity of iron and how it stands as to the proportion taken up in sulphuret of iron and that produce carbonic acid and peroxide of alphuret of iron. But it is obvious that the carbonic acid which has thus been eliminated must have been sufficient in quantity to make an atmosphere of carbonic acid equal in height to our present atmosphere. Again, decomposition of alphuret of iron, replacement of hydrogen, this by the combining action of the atmosphere forms sulphuric acid, and the sulphuric acid in its progress to the sea produces gypsum, and liberates carbonic acid. Sulphuric acid is also generated in the neighbourhood of volcanoes, and readily becomes sulphuric acid with the minerals. Moreover, thermal water, if aided by heat, will decompose lime-stone and liberate carbonic acid. Hence it is that there are extremely complex results from mineral parts mixed at different temperatures.

The dissolving and decomposing action of ordinary water is therefore general. The results also partake of the character of the rock in virtue of the composition of which it forms a part, and in accordance with the changes to which the rock is subject. Such changes and the various products to which they give rise have to be regarded as a type and criterion of what has occurred in former portions, periods, either of decay or of reformation from which have resulted wide-spread rock masses, and which have at one period time altered the surface-features of the earth. But the rich fields of palæontology, and of the processes which have gone to form these rock materials, are to become the sources from which to the student's department of geology can have a true conception, and be more living instead of a merely descriptive science.

Physical Properties of Minerals.

Characters Dependent on Light

There are few more interesting departments of science than the relations of mineral bodies to light, and the modification which it undergoes either when passing through them or when reflected from their surface. In this place, however, we only consider these phenomena so far as they present distinctive characters in the mineralogical examination of minerals, or furnish characters by which to distinguish one species from another.

Lustre. These characters admit of no precise or mathematical determination, they are of considerable value in mineralogy. One of the most important distinctions founded on them is that between minerals of metallic and non-metallic aspect or character. Transparency and opacity nearly coincide with this division, the metallic minerals being almost constantly opaque, the non-metallic more or less transparent. Minerals which are perfectly opaque, and show the peculiar brilliancy and opacity of surface of polished metals, are named metallic; those which possess these properties in an inferior degree are semi-metallic; and those without these properties are non-metallic.

Lustre has reference to either the intensity or the quality of the reflected light, considered as distinct from colour. Several degrees in intensity have been named: (1) splendent, when a mineral reflects light so perfectly as to be visible at a great distance, and lively and well-defined images are formed in its faces, as galena, specular iron, or calcite; (2) shining, when the reflected light is well, and only forms indistinct and cloudy images, as heavy spar or calcite; (3) glistening, when the reflected light is so feeble as not to be observable at a greater distance than an inch, length, and no longer forms an image, as talc; (4) glimmering, when the mineral held near the eye in full clear daylight presents only a number of such luminous points, as red hæmatite and granular limestone. When as in chalk or kaolin, the lustre is so feeble as to be indiscernible, the mineral is said to be dull.

In regard to the first or quality of the lustre, the following varieties are distinguished: (1) the metallic, seen in much perfection in native metals and their compounds with sulphur, and imperfectly on fine coal; (2) adamantine, found in beautiful perfection in the diamond, and in some varieties of blende and cerussite; the semi-adamantine metallic adamantine, as seen in wolfram and black jack; (3) vitreous or glassy, seen in rock crystal, or common calcite; the semi-vitreous to adamantine, in flint glass; sub-vitreous, seen in boracite, chabazite, &c.; (4) resinous, when the body appears as if covered with oil, as in amber, blende, and garnet; (5) waxy, as in wax opal and ozocerite; (6) pearly, like mother-of-pearl, seen in cyclite, talc, heulandite; (7) silky, the glimmering lustre seen on fine fibrous aggregates, like amianthus, fibrous gypsum, chrysotile, and fibrolite.

The surfaces and kinds of lustre are generally exhibited differently by multiple faces of the same crystal, but always similarly by like faces. The lateral faces of a right square prism may thus differ in lustre from that of a terminal face. Thus the lustre of the lateral face of apophyllite is vitreous, while that of the terminal, at right angles thereto, is pearly: chrysotile is silky when split along the fibres, dull when at right angles to them.

The surface of a cleavage plane, in foliated minerals, generally differs in lustre from the sides, and here again in some cases the latter are vitreous, while the former is pearly, as in heulandite.

As shown by Haidinger, only the vitreous, adamantine, and metallic lustres belong to faces perfectly smooth and pure. In the first, the index of refraction of the mineral is 1·3 to 1·8; in the second, 1·9 to 2·5; in the third, above 2·5. The pearly lustre is a result of reflexion from numberless lamellæ, or cleavage planes, within a clear-lustred mineral, and in hydrated minerals, as in the zeolites, it is the result of incipient change,—namely, a loss of water before exposure to the atmosphere.

Colour. This is a property which is of very inferior value. Minerals are so seldom, if ever, absolutely pure that very minute quantities of an intensely coloured impurity may impart colour to a substance inherently colourless, or overpower a feebler colour which may be its own. **Colour.**

Some few minerals have colour so strong or have a constitution so little susceptible of intermixture, that they retain almost unimpaired the colour special to them. Such a substance is pyrite: its brass-yellow colour may be heightened to gold-yellow by intermixture with copper sulphuret, or it may be slightly bleached by arsenic; but the nature of its composition does not admit of the infusion of ordinary colouring matters. The yellow of native gold, again, may be paled by impoverishment with the white of silver, down to the dull tint of electrum; but no foreign colouring matter can intrude itself into its crystals. Such substances as these, native metals, sulphurets, &c., have colours essential to them, dependent on their constitution, and to a great extent characteristic of the species.

A great number of minerals are colourless of themselves, and thus very liable to the influence of minute quantities of foreign tinctorial impurity. These are absolutely transparent and devoid of colour when in crystals, but white and opaque when reduced to powder, as ice and snow, calcite and chalk, rock crystal and sand. But such substances are generally coloured; "muddied" it would be called in the first case, though it is equally so with the others. Such false colour may be imparted in several ways. It may be (1) from their holding dissolved some colouring matter; (2) from mechanical mixture of colouring substances such as metallic oxides, or minute crystals ("endomorphs") of another mineral; or

3) from chemical replacement,—the substitution of a smaller or rger quantity of a coloured isomorphous ingredient.

As illustration of the first, silica, colourless in rock-crystal, has een found of almost every tint, due frequently to volatile hydrocar- ons which are dissipated by heat. Fluorite also, found of almost very shade of every colour, may possibly be to a certain extent eferred here.

Quartz, felspar, and calcite are often coloured accidentally by mbedded layers of foreign "inclusions," or by "pseudomorphous" These are mechanically mixed, so far as revealed, then resence in a structure of different and non-miscible chemical omposition but crystallographically arranged. The colour may ne lines of interrupted or intermittent growth, or, in the case of udomorphs, the axial positions of the minute structure of the crystals lie in one plane, or in the same set of planes.

As an instance of colours introduced through chemical eplacement, calcite may be cited. Carbonate of lime is sometimes a portion of this be replaced by carbonate of magnesia, and a rtain amount of pearly opacity, if by carbonate of manganese d a pink tinge; if by carbonate of iron, of yellow, varying ncreased through oxygen absorption and "weathering" to brown nt, and ultimately to a dark brown.

Sulphuret of zinc, chemically white, and hence the palest trans- arent may, through metallic substitution, be found almost all nts of yellow, orange, brown, and black. Again, hornblende, ugite, and garnet, silicates, which in their purest state of transpa- te, tremolite, and water garnet are colourless, may assume green, rown, red, and black tints from the accumulation of other metallic bstances.

Hence it would appear that a very advanced practical knowledge of the subject is necessary to enable us to record ourselves the information which is to be derived from this external nature.

The accidentally coloured minerals sometimes present two or ore colours or tints, even in a single crystal. Very remarkable xamples occurring in fluor spar, apatite, sapphire, smoky quartz, tourmaline, and cyanite. The most still more common are compound inerals, on which the colours are variously arranged in points, ngles, clouds, veins, stripes, bands, or in broader and ramifying ms. Some minerals again change their colour from exposure to ght, the air, or damp. Then either the surface alone is affected "tarnished," and appears covered as with a thin film producing some minerals, as silver and arsenic, only one colour, in hers, as chalcopyrite, hæmatite, bismuth, stibine and anthracite, arious or iridescent hues, when they are said to have a ravonine lustre. Or occasionally the change pervades the whole ineral, the colour either becoming paler or disappearing, as in ysoprase and rose-quartz, or becoming darker, as in brown ar, siderite, and rhodonite. In a few minerals complete change f colour takes place, as in heterosite and in the chlorophæite of n Western Isles of Scotland, which, on exposure for a few hours, sses from a transparent yellow green to black. These alterations generally connected with some chemical or physical change, he tarnished colours sometimes only appear on certain faces of a rystal belonging to a peculiar form. Thus a crystal of copper yrites (like fig. 89) has one face P free from tarnish, the faces d e, close to P, dark blue; the remainder of the first violet, and hen, close to P, gold-yellow.

Some crystalline minerals exhibit in certain directions a very vely play or change of colours from reflected light. Thus we have en many various hues on the cleavage planes of labradorite, and eems produced by a multitude of very thin quadrangular pores, terposed in the mineral, like minute parallel lamina. On the eavage planes of hypersthene it appears copper-red, and is easoned by similar pores, or by numerous small brown or black amine of some foreign substance interposed in a parallel position etween the planes of the hypersthene. The chatoyant or changeable olours of the sun-stone arise from scales of hæmatite, and partly ater- osed, and that of avanturine from scales of mica. The play of olour in the noble opal seems to be produced very nearly in the same anner as that in the labradorite. A similar opalescence is seen certain minerals when cut in particular forms. In the sapphire, it hemispherically over the chief axis, it appears like a star with x rays, in garnet it shows four rays, in certain varieties of chryso- eryl and of adularia it has a blue hue, and it is also very remarkable in the cat's-eye variety of quartz. Iridescence often arises from ery fine fissures, producing semicircular arches of prismatic tints, hich, like the colours of thin plates in general are referred to the nterference of light.

Streak. This name is applied to the appearance and he colour of the line or furrow produced in minerals by *rowing the edge of a hard tempered knife or file along* heir surface, or to the stain obtained by rubbing a soft nineral on such a substance as paper or porcelain. Taken long with the hardness, which may to a certain extent be determined by the same operation, it is one of the most valuable tests which we possess.

The furrow may be lustrous or it may be dull. Powder or splinters may lie along its course, or a still adherent ridge may have been merely rolled over. The furrow and the powder may each be possessed of colour, though such may not be distinguishable in the mineral, or may have a colour quite different from that of the mineral. Three illustrations of the metallic lustre of the test may suffice. Argentiferous gold, chalcopyrite, and pyrite, differing immensely in value, may readily be mistaken for each other. The knife, when drawn along the surface of the first, finds much to cut upon adhering ridge, and leaves a bright streak of the same colour as the specimen. When drawn along the crystallized surface it cuts through covered with cohesive powder which when rubbed on paper or the hand is greenish-yellow. When drawn along the third it has no effect, as pyrite is harder than the knife. Pitchblende, hæmatite, and limonite all occur in black, obscure, tuberose forms, and have all been termed "black hematite." There exists also a great difference in the value. The knife makes little impression on pitchblende but leaves a blue bituminous line, it makes a blood-red line on hæmatite, and a rich ochre-yellow on limonite. Graphite and molybdenite both very tallic in their crystalline plates, both occur in the same scales, both have a grey-blue colour and a brilliant metallic lustre, both turn the hand or paper, the streak of the first best on rough paper is black tending to blue, that of the latter green-ish. Rough porcelain is the best material for determining the streak of soft minerals.

Diaphaneity. Minerals, and even different specimens of the same species, vary much in this quality. Some transmit so much light that small objects can be clearly seen, or letters read, when placed behind them, such are named trans-parent. They are semi-trans-parent when the object is seen only dimly, as through a cloud, and trans-lucent when the light that passes through is so broken that the form of the object can be no longer discerned, some minerals are only thus translucent on the thinnest edges. Others transmit no light, and are named opaque.

Refraction. It has already been mentioned that most crystals—all, in fact, except those of the cubical system—exhibit the phenomena of double refraction. For a general explanation of these phenomena the reader is referred to Light, vol. xv. p. 609 *sq.*

The direction in which there is no double refraction is named the optic axis of the crystal, sometimes (happily the axis of double refraction. Now in certain minerals it is found that there is only one direction with this property, whereas in others there are two such directions, and they have in consequence been divided into uniaxal and biaxal. To the former belong all crystals of the tetragonal and hexagonal systems, to the latter all those of the other three systems. In the former the optic axis coincides with or is parallel to the crystallographic axis. In one uniaxal crystals the index of refraction for the extraordinary ray is greater than for the ordinary ray, and in others it is smaller. According as it is greater or less they are said to have positive (attractive) or negative (repulsive) double refraction.

Quartz is an example of the former, the index of refraction, according to Main-hem for O being 1.5471, for E 1.5582; calc-spar of the latter, the index of O being 1.6543, that of E 1.4833. The index of E is in both cases tabulated at the incandescence.

It should be observed that the optic axes are not single lines, but directions parallel to a line, perhaps through every part of the crystal. It is also important to remark that this property divides crystals into three great groups—the cubic, with single refraction, the tetragonal and hexagonal, with double refraction, and uniaxal, those of the other three systems, also double, but biaxal. These properties are therefore of the greatest use in determining the system to which a mineral belongs.

Polarization. Intimately connected with the property of that of the polarization of light, which affords an easier means of determining mineralogical characters than the direct study of double refraction. For the elements of this subject see Light, vol. xv. p. 611 *sq.*

While a consideration of the optic axes enabled us merely to arrange the systems of crystallization in three groups, the phenomena of polarization not only bear out a further subdivision of the whole into the above six systems, but disclose, in many cases, phenomena marked, special to individual species. The optical consideration of these phenomena enables us to fix three directions at

ght angles to one another called the axes of optical asticity such that the effect of the crystal on the minous vibrations the elastic ether is a maximum in ne of these directions, a minimum in a second, and a aximum in the third. The length of these axes is the measure of the action. In certain cases the directions of the axes of optical elasticity is different o light of the different colours.

the principal sections corresponding to the crystallographic axes, n length, enabling us to class all crystals as

of the cubic system. Here the three axes of equal. The most simple of the rhombohedral system, in which the three axes are equal to one another; the ed by two equal axes perpendicular to the crystallographic axis, the third axis coinciding with the axis.

of the next principal system. The direction of the of optical elasticity coincide with the crystallographic , taken parallel to the diagonals of the base of the rhombo lso parallel to the vertical axes of the primitive prism parallel pair of faces.

Crystals of the oblique prismatic system. Only one of the of optical elasticity coincides with the crystallographic horizontal axes or the inclined horizontal axes of the mmon base, the direction of the two other not having any ndent relation, *a priori*, with the inclined or diagonal inclined s of the base, and with the vertical axis or vertical edges of primitive right prism.

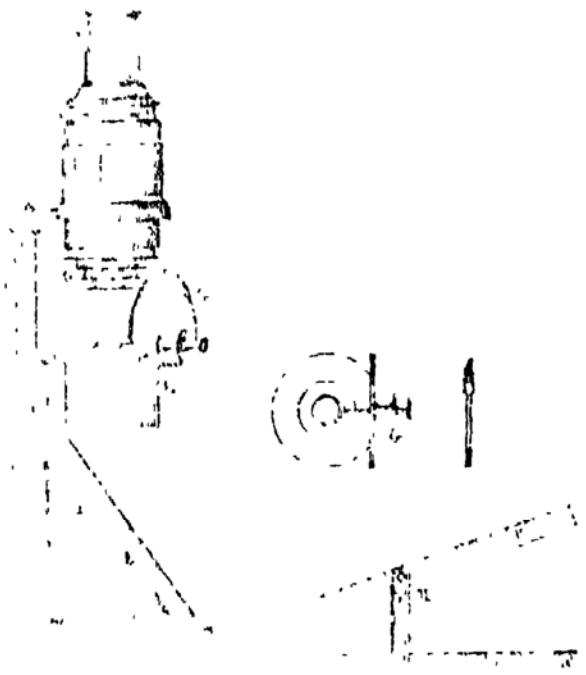
Crystals of the triclinic system. The three axes of optical city have no relation that can be referred *a priori* to the stallographic axes, whatever position may be assigned to these relation to the primitive edges.

In crystals belonging to the last three systems the three axes of city are unequal.

The axes of elasticity are in general such that a crystallographic crystal in the direction of any one of them is divided to two, which follow that direction with different velocities pending on the lengths of the other two axes. For any other tion there will be several also corresponding to different locities; but their rates will now depend in a more complex anner on all three axes. In two directions, and only in two, axes are all unequal, the retardation becomes unity, or the rays not vided. These directions are the optic

The displacement of the axes of elasticity for light of different ours—already mentioned—takes place to two different degrees in crystals of the monometric system and for all directions in the dimetric, hombohedral, oblique, and triclinic systems. In the other systems it does not

It is easier to follow the distinctive features of the different systems until we proceed to consider the other phenomena which they display, when examined in a beam of polarized light. Various instruments have been devised for the purpose, and of the



Apparatus of Dr Brewster

heading also we must refer for the phenomena of circular polarization.

Double Refraction and Polarization of Composite Crystals. In Optic all the crystallized bodies whose action upon light we have been proper considering, the phenomena are identical in all parallel directions, ties of the smallest fragment having the same property as the largest, compos from whatever part of the crystal it is taken. In the mineral crystal world, however, and among the products of artificial crystallization, there occur crystals which are composed of several individual crystals whose axes are not parallel. These crystals sometimes present regular symmetrical forms that mineralogists have long regarded as simple forms, and it is probable that they were so viewed if they had not been subjected to the scrutiny of polarized

Fig. 241.

A remarkable case has been observed in the crystals of Brazilian topaz, and apophyllite of potash, which appeared to be a simple crystal, were found to be tessellated, consisting of crystals of potash combined in their principal axes parallel. When

Fig. 242.

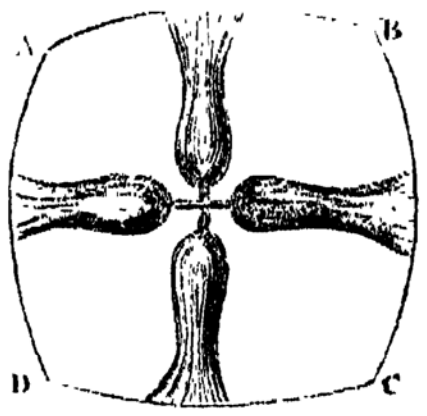


Fig. 243.

a system of biaxal crystals, at a distance from the eye, instead of the elliptical appearance shown in fig. 241, each is rectangular, having the same tint.

A crystal of this class of minerals is the tessellated examination of this body by polarized light is For the results the reader is referred to his paper *Transactions*, vol. ix. p. 328.

are representations of the figure produced in an internal slice of the barrel or cylindrical

apophyllite from Kudlisaet, in Disco Island. The figures are from different specimens. The shaded part of them has only one axis of double refraction while the four sectors have two axes. The mechanical structure of the clear plates to double the optical figure even after the plates are

Iron with Planes of Double Meteoric iron, a mineral among the cubical crys is found by Brewster to be on its action upon light, and to act

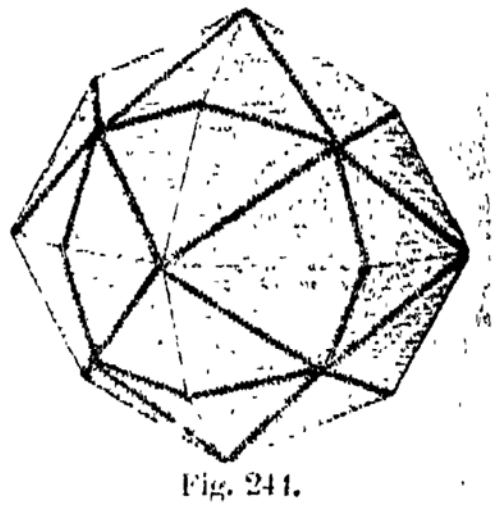

Fig. 244.

perties, or state to which the double refraction, structure was related in the same manner as it is in one or two of the other minerals. It crystallizes most commonly in the form of the icositetrahedron. If we suppose a complete crystal of it to be exposed to polarized light, it will give the figure shown in fig. 211, where the dark shaded lines represent those in which there is neither double refraction nor polarization, the rays refracted and the tints commencing at the planes of cleavage having their maximum in the centre of the space enclosed by three of the dark lines. When light is transmitted through any pair of the four planes which are adjacent to any of the three axes of the crystal it is doubly refracted, the least refracted image being the extraordinary one, and consequently the double refraction negative in relation to the axes to which the doubly refracted ray is perpendicular. If we suppose the crystal to have the form of a

Fig. 245.

cube, the planes of double refraction will be, as in fig. 215, a plane passing through the two diagonals of each face of the cube.

The tints vary as the square of the distance from the nearest plane of double refraction.

Pleochroism.—Closely connected with double refraction is that property of transparent minerals named pleochroism (of many colours), in consequence of which they exhibit distinct colours when viewed by transmitted light in different directions. Crystals of the cubic system do not show this property, whilst in those of the other systems it appears in more or less perfection, in tetragonal and hexagonal minerals as dichroism (two colours), in rhombic and clinic systems as trichroism (three colours). In most cases these changes of colour are not very decided, and appear rather as different tints or shades than as distinct colours. The most remarkable of dichromatic minerals are the magnesian mica from Vesuvius, the tourmaline, and ripidolite; of trichromatic, iolite and andalusite from Brazil, diaspore from Schemnitz, and [illegible] nite.

In a specimen of yellow Iceland spar [illegible] of an orange-yellow colour, while the ordinary image is yellowish white. Along the axis of double refraction the colours of the two pencils is exactly the same, and the difference [illegible] with the inclination of the refracted ray to the axis. [illegible] the invariable law of the pleochroism produced [illegible]. Sir John Herschel found several [illegible] to have a brownish colour along the axis, and it might [illegible] to be yellow green. There can be little doubt that this property [illegible] found in every crystal of sufficient refraction. Even in the crystals [illegible], a slight inequality in the intensity of the two images may be observed; and when it is distinctly coloured the difference of intensity is very easily seen, even when the two colours are not of a different kind.

The phenomena of dichroism are best seen in [illegible] with two axes of double refraction, and are well exhibited [illegible] mineral which crystallizes in six- or twelve-sided prisms are of a deep blue colour when [illegible] to the axis, and a yellowish brown colour when viewed [illegible] to it.

If *abcd* (fig. 246) be a section of the prism [illegible] parallel to the axis of the prism, the transmitted light will be blue through the faces *ab* and *dc*, and yellowish brown through *ad*, *bc*, and in every direction perpendicular to the axis of the prism. If we grind down the angles *a*, *c*, *b*, *d*, so as to replace them with faces *mn*, *m'n'* and *op*, *o'p'*, inclined 31° 41′ to *e* or to the axis of the prism, then, if the plane *abcd* passes through the optic axes, we [illegible] observe, by transmitting polarized light through the crystal in the directions *ae*, *bd*, and [illegible] quently analysing it, a system of rings round each of these axes. The system will exhibit the individual rings very plainly if the crystal is thin; but if it is thick, we shall observe, when the plane *abcd* is perpendicular to the plane of primitive polarization, some branches of blue and white light diverging in the form of a cross from the centre of the system of rings, or the poles of no polarization, as shown at *p* and *p'* (fig. 247), where the shaded branches represent the blue ones. The summits of the blue masses are tipped with purple, and are separated by whitish light in some specimens and yellowish light in others. The white light becomes more blue from *p* and *p'* to *a*, where it is quite blue, and more yellow from *p* and *p'* to *c* and *d*, where it is completely yellow. When the plane *abcd* is in the plane of primitive polarization the poles are marked by spots of white light but everywhere else the light is a deep blue.

Fig. 247.

In the plane *cadb* (fig. 247) the mineral, when we look through it by common light, exhibits no other colour but yellow, mixed with a small quantity of blue, polarized in an opposite plane. The ordinary image at *c* and *d* is yellowish brown, and the extraordinary image faint blue, the former receiving some blue rays and the latter some yellow ones from *c* and *d* to *a* and *b*, where the difference of colour is still well-marked. The yellow image becomes tainted from *a* and *b* to *p* and *p'*, till it changes into blue, and the faint blue image is strengthened by other blue rays, till the intensity of the two blue images is nearly equal. As the incident ray advances from *a* and *b* to *p* and *p'*, the faint blue image becomes more intense, and the yellow one, receiving an accession of blue rays, becomes of a bluish white colour. The ordinary image is whitish from *p* and *p'* to *a* and the extraordinary is deep blue, but the whiteness gradually diminishes towards *a*, when they are both almost equally blue.

The principal axis of double refraction in rubies is negative. The [illegible] purple tinge and the least refracted one [illegible]

[illegible] used to the determination of [illegible] crystallizing in the [illegible] with the exception [illegible]

[illegible] corundum, including ruby and sapphire, tourmaline, beryl, absorbing a greater degree of ordinary ray [illegible] beryl, apatite, and some nephylites, while [illegible] as prism, red quartz, sulphate of lime, nephylite, absorb in a greater degree the extraordinary [illegible] but found also that certain crystals [illegible] transmit [illegible] without [illegible]

[illegible] colour of [illegible] limit, and [illegible] Hardness does [illegible] relation of [illegible] embodiment of [illegible]

[illegible] transmit [illegible] lowest [illegible] [illegible] 28, [illegible] [illegible] shade by two [illegible]

[illegible] to red with [illegible] metallic [illegible], which [illegible] [illegible] and respond [illegible] holes about the fifteenth of an [illegible] width at the other. The lens [illegible] a focal distance which [illegible] object holes about half an inch from the square hole.

On looking through the lens and presenting [illegible] of the square hole at [illegible] on put together [illegible] at [illegible] on the other, [illegible] image polarized in the plane which [illegible] of the prism, that of the other in [illegible] plane of the longer diagonal. When a plate [illegible] [illegible] focal distance and examined by [illegible] [illegible], then, on the turning of the instrument [illegible], the polarizing [illegible] plane coincidence with those of the eye [illegible] the two images opening will [illegible] colour of the [illegible] which the light [illegible] by the crystal [illegible] complementary [illegible]. The [illegible] through the crystal [illegible] two colours [illegible] more obvious.

Phosphorescence.—The [illegible] [illegible] partial [illegible] material [illegible] without combustion or [illegible]

no mineral pho-phoresces readily when the discharge passes through it; it generally phosphoresces with a different colour after it has been thus excited.

Fluorescence is the property whereby rays of light of a refrangibility higher than those ordinarily seen by the human eye are rendered visible. The substance when placed in the violet end of the spectrum, and carried beyond it into the dark, is seen to become luminous through the agency of the rays of extreme refrangibility. This property is well marked in the variety of fluorite which is pale [illegible] when transmitted light, and deep purple by reflected light. Uranite and some petroleums also exhibit the property.

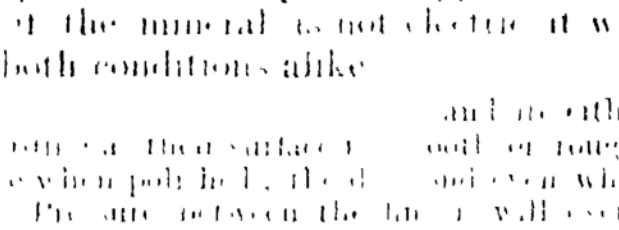
Electric, Magnetic, and Thermic Properties.

Electricity. Friction, pressure, and heat may all excite electricity in mineral. To observe the property delicately the specimen is required, formed of a light needle terminating at both ends in small balls, and suspended horizontally on a fine pivot by an agate cup. Such an instrument, if the mineral be electrified negatively by touching it with a stick of sealing-wax excited by rubbing, or positively by merely bringing the wax so near as to attract the needle. When the instrument is in this state, the mineral, if also rendered electric by heat or friction, will attract or repel the needle according as it has acquired electricity of an opposite or of a similar kind. But if the mineral is not electric, it will attract the needle in both conditions alike.

Most [illegible] and to either [illegible] negative according to their surfaces [illegible] cool or rough. [illegible] one point when polished, the [illegible] and even when [illegible] positive. The [illegible] between the [illegible] will excite [illegible] positive electricity in pieces of [illegible] from parent-stone [illegible] by [illegible]. Fluor, arragonite, fluor-spar, carbonate of lead, quartz, and other minerals show this property, but in a more feeble degree; some [illegible] remain excited much longer than others, [illegible] for a very long time. Heat or change [illegible] to many crystals, [illegible] so much that [illegible] crystal [illegible] fluor per diamond, [illegible] [illegible] [illegible] electricity of the two electric [illegible] opposite parts of a crystal which are named electric poles. Each pole alternately positive and negative, the one when the mineral is being [illegible] the other when it is cooling. Under [illegible] treatment of this kind [illegible] peculiarly noteworthy.

A [illegible] of [illegible] this polar-electric mineral [illegible] named [illegible] for the [illegible] crystal form. Tourmaline, calamine, and [illegible] acquire [illegible] the [illegible] thus [illegible]. Its polarities [illegible] when the temperature is [illegible], and [illegible] exhibited when it [illegible] to decline, and when the heat is [illegible] they [illegible].

Rose and Rath name one of the poles the analogous electric pole, and the other the antilogous electric pole. The former becomes positive while the crystal is heating, and negative while cooling, the latter negative while heating, and positive while cooling. Tourmaline at 30° C. electrical polarity not [illegible] to 100°, as long as the [illegible] to rise; if the temperature remained



stationary an instant, the polarity disappears [illegible] shortly manifested itself [illegible], when the temperature [illegible] to decline [illegible] but one end of the crystal was heated the crystal was unpolarized, but when two ends were unequally heated each acquired an electrical state independent of the other. In tourmaline the extremities of the prism are dissimilarly modified, and that end which presents the greater number of planes is the antilogous pole, or, if the number of planes is the same, the secondary rhombohedrons of the antilogous pole have (one or more of them) longer vertical axes than those of the analogous pole. Fig. 249 (tourmaline) is the antilogous pole (negative under increasing heat), and fig. 250 the analogous pole. The pyramid of the analogous end is more flattened by its facets than that of the antilogous end; thus e^3 and d^3 of the antilogous end are more acuminating than e^1 and d^1 of the analogous end. The same is the case with the other two crystals (figs. 251, 252).

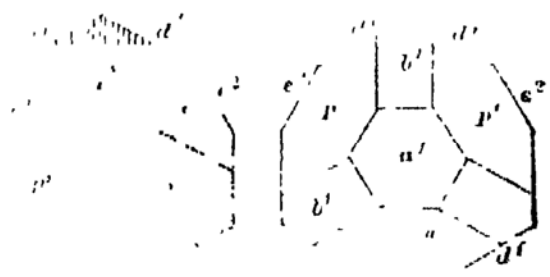


Fig. 251.

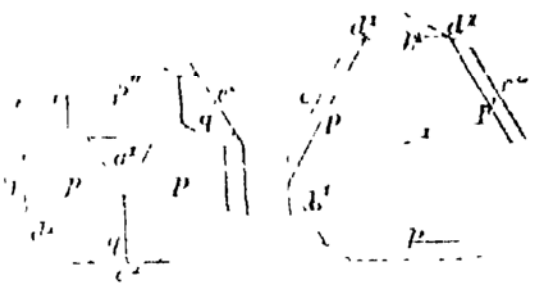

Fig. 252.

Pyro-electricity has been observed in the following substances: tourmaline, topaz, arsenic, boracite, scolezite, prehnite, electric calamine, sphene, chrysoberyl, heavy spar, and crystallized [illegible].

Pyro-electricity is of two kinds, either [illegible] polar or centrally polar. In the former the extremities are opposite poles. In the latter two sets of a prism are of the same name, and the opposite pole to each is intermediate between the two.

The examples of the first kind are tourmaline, calamine, and scolezite, which are uniaxal, axinite, binaxal; boracite and rhodizite, with four axes. Calamine, like tourmaline, has the sharper extremity the antilogous end, and the more flattened the analogous. Compound crystals from Altenberg have both ends analogous, and the portion which lies between the twin antilogous electric, the pyro-electric axis corresponds with the vertical axis of the prism, as in tourmaline. Boracite, which crystallizes in cubic forms, with the opposite angles differently modified, has pyro-electric axes corresponding to the four octahedral axes. In figs. [illegible] this species, the plane which has its angles modified by e^1 is the antilogous pole, and that with the

Fig. 253.

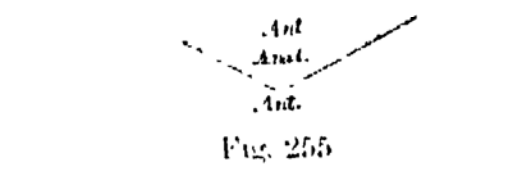

Fig. 255

[illegible] connected at [illegible] the analogous pole; and, generally, the antilogous pole has either one numerous or larger facets. Rhodizite resembles boracite in its pyro-electricity.

The [illegible] in which pyro-electricity of the second kind has been observed are prehnite and topaz. If fig. 251 represent a tabular crystal of prehnite, the poles will be situated as marked, the analogous being central, and the antilogous at either extremity of the shorter diagonal of the rhombic prism. Topaz has in a similar manner a central analogous pole, and an antilogous at either extremity of the shorter diagonal. In some instances there is a separate set of similar poles near one or the other angle, as in fig. 255; this must be due to the crystals being of a composite nature.

Magnetism. This property is very characteristic of the few minerals in which it occurs,—chiefly ores of iron or nickel. Some magnetic iron ores possess polar magnetism, or are natural magnets; while the common varieties of magnetite, meteoric iron, magnetic pyrites, precious garnet, and other minerals, are simply magnetic. Most minerals are only attracted by the magnet, but do not themselves attract iron.

Minerals, as other substances, have also been divided into magnetic and diamagnetic. See MAGNETISM.

The ordinary mode of testing whether a mineral is magnetic or not is to bring it near a pole of a delicately suspended magnetic

edle, and observe whether it causes it to vibrat . Another mode to apply a strong magnet to the mineral in powder. Th are sufficient for the mineralogist. Delesse has experimented extensively upon the magnetic force of minerals, and has determined the relative amount for numerous species. Calling the force for tyrian steel 100, the following are some of his results:

Native platinum	
Magnetic iron ore	
Franklinite from the United States	
Chromic iron	
Spinel (pleonaste), from Monzoni Tyrol

Crystallomagnetic Action. The [illegible] ar alluded to belongs to the [illegible] ry-talline form. There is also a kind of p elated to the crystalline or optic axes [illegible] ry ful of cyanite, suspended between [illegible] orth, by the magnetic power of [illegible] rne compass needle, from which [illegible] e obtained; and the line of direction [illegible] optic axes. Other crystals which [illegible] take a transverse or equatorial position. Th [illegible] diamagnetic crystals.

Conducting for Heat. Senarmont found [illegible] ducting power of colours and of crystals [illegible] ystem is equal in all direction, but that [illegible] different directions in crystals belonging to all the other systems, exhibiting character analogous to [illegible] from their double refraction, conformable with the [illegible] axes of the crystal, and referable, as in the latter case, to axes of elasticity, or unequal compression of the molecules.

The fundamental fact is easily shown by taking [illegible] of rock crystal, one cut transverse to the axis and [illegible] Through the centre of each plate a small hole is drilled for the reception of a platinum wire, which by insertion into the hole [illegible] the plate. The other end of the wire to be heated, and the rate of the conduction of the heat rendered visible by the amount of a flow coating of beeswax, with which the plate has been previously coated, which is melted round the central hole. It will be seen that in the transverse slice the wax is melted in a circular form, while in the longitudinal slice the form is elliptical (fig. 256). The conduction is equal in all directions as regards the transverse axes of the hexagonal prism, but more rapid in one direction in the longitudinal slice, and that direction is the line of its optic axis. In the case of quartz the two diameters of the ellipse are as 1000 to 1312.

Fig. 256.

If the regular disposition of the molecules of amorphous bodies be interfered with by unequal tension or compression, the regularity of their power of conducting heat is destroyed, and they also show elliptical forms of melted wax, and the shorter axis of the ellipse is in the line of pressure or undue packing of the molecules. The heat thus does not travel so fast in this direction, partly because it is spent in the heating up of the greater number of molecules. Hence we might conclude that along the main axis of quartz a smaller number of molecules are packed in an equal space than along the transverse. The following are the more important of Senarmont's results:

1. Crystals of the tetragonal and rhombohedral systems have one axis of conductivity which is either greater or smaller than the others, and this axis coincides with the main crystallographic axis. The isothermal surfaces are ellipses which lie in the line of this axis, and these ellipses may be either elongated or flattened in the direction of this line.

2. In crystals of the right prismatic system the isothermal surfaces have three unequal axes, which coincide with crystallographic axes drawn parallel to the edges of the rectangular prism.

3. In crystals of the oblique rhombic system the isothermal surface have three unequal axes, one of which coincides, with [illegible] horizontal diagonal of the base, while the other two have directions which are not referable to any law.

4. In crystals of the anorthic system the isothermal surfaces have three unequal axes, all with indeterminate [illegible] relation.

In crystals of a single axis there appears to exist no constant relation between the axes of optic elasticity, whether maximum, minimum, and the axis of the greatest or of the least calorific conductability. Thus, of the minerals examined by Senarmont, quartz, [illegible], chabasite, [illegible], and calcite have all their greatest axes of calorific conductability parallel to the optic axis, whereas, beryl, tourmaline, and corundum, optically negative, have on the contrary their smallest axes of calorific conductability parallel to the optic axis.

In crystals belonging to the oblique rhombic system [illegible] coincidence between the thermal axes and the axes of elasticity. Descloizeaux has noted for the latter [illegible] of [illegible].

Dilatation by Heat. In crystals of the [illegible] system, where the molecules are arranged unequally as regards their axes, the amount of their dilatation when heated is unequal, and the direction of their axes [illegible]. Our knowledge of the [illegible]

[illegible] crystals of [illegible] variation [illegible] equal [illegible] tion is dimunished with the increase [illegible] negative double refraction, and [illegible] positive. According to Descloizeaux the same is true of [illegible]. The dilatation of each [illegible] according to [illegible] permanent [illegible].

Kopp has shown that in the carbonate of lime, magnesia, manganese, and zinc, which are [illegible] the angles of the crystals, the vertical axis [illegible] the lateral. And since heat diminishes the density, and therefore increases the volume, the axis should be lengthened by an increase of temperature, as is true. The [illegible] has determined by calculation that the change of angle from 74° to 90° should be 7′ [illegible].

Although in the greater number of cases the variations are small [illegible] to be accurately measurable, yet they may be sufficient to establish [illegible] between substances which have identical geometric form while belonging to different systems of crystallization. The angle of cleavage or direction might at a certain temperature be 90°, and so remain with a rise, but that an [illegible] rhombohedron change when [illegible] the temperature altered, while the angle of a true monometric cube is constant at all temperatures. The [illegible] direction in many [illegible] not from heating [illegible] accompanied by changes in optical properties. In a monometric crystal where the principal axes [illegible] unequally, the change affects the amount of [illegible] of the axes. The amount of alteration in a certain [illegible] determined, is extraordinary. At the ordinary temperature [illegible] of the divergence of the optic axes which [illegible] symmetry is about 90° for red light; when heated to [illegible] diminished to 0, and for the moment the crystal appears uniaxal. When more highly heated, the [illegible] diverge in a plane at right angles to the original one, [illegible] change take place in reverse order. In beryl and [illegible] the alteration in the angle of the optic axes or divergence when heated.

Characters depending on Cohesion.

These characters are of five kinds: (1) hardness, (2) tenacity, (3) elasticity, (4) cleavage, (5) fracture. All may be considered as related to the power of resisting attempts to separate one part from another.

1. *Hardness.*—A harder body is distinguished from a softer, either by attempting to scratch the one with the other, or by trying each with a file. Each of these methods is used by the mineralogist in determining the hardness of the species, though the latter is in most cases to be preferred. Both methods should be employed when practicable.

Certain varieties of some mineral give a low hardness under the file, owing either to impurities or imperfect aggregation of the particles, while they scratch another mineral upon which a file would have no effect, showing that the particles of the first are hard, though loosely aggregated. Chiastolite, spinel, and sapphire are common examples of this. When the mineral is too hard to be impressed by a file, the peculiarity of the grating sound will suffice for the practised ear.

Mohs introduced a scale of hardness, consisting of ten minerals, which gradually increase in hardness from 1 to 10. The intervals between 2 and 3 and 5 and 6 are larger than the others. Breithaupt has therefore introduced another degree of hardness between each of the above, and thus his scale consists of twelve minerals.

The scale is as follows:

1. Talc, common laminated light green variety.
2. Gypsum, a crystallized variety.
2·5 Mica (muscovite).
3. Calcite, transparent variety.
4. Fluor-spar, crystalline variety.
5. Apatite, transparent variety.
5·5 Scapolite, crystalline variety.
6. Felspar (orthoclase), white cleavable variety.
7. Quartz, transparent.
8. Topaz, transparent.
9. Sapphire, cleavable varieties.
10. Diamond.

If the file abrades the mineral under trial with the same ease as No. 4, and produces an equal depth of abrasion with the same force, its hardness is said to be 4; if with more facility than 4 but less than 5, the hardness may be 4½ or 4¼, written in decimals 4·5 or 4·25. Several successive trials should be made to obtain certain results.

The use of the file is acquired with very little experience, usually a single trial is sufficient. Care must be taken to apply the file to edges of equal obtuseness. That part also of the specimen should be selected which has not been altered by exposure, and has the highest degree of transparency and compactness of structure. The one size for determination should be rather heavy, and the file should be passed three or four times over the specimen.

Where the scale of hardness is wanting, or a more thorough determination is sought, the following experiments may serve:

Every mineral that is scratched by the finger nail has H. 2 or less. Mineral that scratch copper have H. 3 or more. Polished white iron has H. 4·5. Window-glass has H. 5 to 5·5. Steel wire or file has H. 6 to 7; hence every mineral that will cut or scratch window-glass, or good penknife blades H. less than 6. Flint has H. 7, and will scratch about eleven minerals, including the precious-stones or corundum family.

Many minerals present different degrees of hardness on different faces, examples of which we mention cyanite and mica. These faces belong to the unequilateral primary forms, and like the similar differences of colour, lustre, &c., finds a ready explanation in the theory of their formation: unlike faces are the result of the action of cohesive forces along unlike axes.

The difference of hardness parallel to unlike axes may be perceived in nearly all cases where the methods of trial are sufficiently delicate. Haüy even observed that the cleavage face of a crystal of calc-spar divided it into zones from the other faces; and even in a monoclinate crystal of gypsum it has been found that the faces of the cube and octahedron are specifically alike in this respect.

2. *Tenacity.*—Solid bodies are said to be brittle, sectile, malleable, flexible, or elastic.

1. *Brittle*, when portions are detached in powder or grains on attempting to cut it; as fluor-spar, &c.

2. *Sectile*, when pieces may be cut off with a knife without falling to powder, but still the mineral pulverizes under the hammer; as hornblende, gypsum.

3. *Malleable*, when slices may be cut off, and these slices flatten out under a hammer; as native gold, native copper.

4. *Flexible*, when the mineral will bend and remain bent after the bending force is removed; as gypsum, graphite, talc.

5. *Elastic*, when after being bent it will spring back to its original position; as mica.

A liquid is said to be *viscous* when, on pouring it, the drops lengthen and appear ropy; as petroleum.

3. *Elasticity.*—Investigations on this property have not to any extent been entered upon. The unequal elasticity of unlike faces of crystals has been shown by Savart in his acoustic investigations, and he was able to distinguish the rhombohedral from the other faces in the pyramid of quartz crystals: he also showed that the figures formed upon vibrating plates of crystals were directly connected with their optic axes. Milne, by measuring the amount of recoil of a sphere of calcite when struck at different points by another of rock crystal, found that the elasticity, as thus measured, was greatest along the line of the optic axis, and least in directions at right angles to it. He also found that points which lay intermediate between the main and the transverse axes were most indented by the blows. This goes to show that, although there may be fewest molecules arranged along the lines of the transverse axes, yet cohesion operates with greater intensity along these than in intermediate directions. Elastic

When the tenacity of a mineral is overcome by an overwhelming amount of traction, or its elasticity by a sudden shock, its parts are separated, either in flat and continuous surfaces, or in surfaces which are irregular in the extreme. The first of these modes is termed cleavage, the second fracture. In those substances in which cleavage exists it is found that the planes or directions along which it takes place lie in certain strictly definite positions to one another and to the axes of the crystal. They show not the smallest tendency to a transition or gradual passage into the other directions of greater coherence.

4. *Cleavage.*—The number of these parallel cleavage-planes is altogether indefinite, so that the only limit that can be assigned to the divisibility of some minerals, as gypsum and mica, arises from the coarseness of our instruments. These minima of coherence, or cleavage-planes, are always parallel to some face of the crystal; and similar equal minima occur parallel to every other face of the same form. Hence they are always equal in number to the faces of the form, and the figures produced by cleavage agree in every point with true crystals, except that they are artificial. They are thus most simply and conveniently described by the same terms and signs as the faces of crystals. Cleavage

Some minerals cleave in several directions parallel to the faces of different forms, but the cleavage is generally more easily obtained and more perfect in one direction than in the others. This complex cleavage is well seen in calc-spar and fluor-spar, and very remarkably in zinc blende, where it takes place in no less than six directions. As in each of these the division may be indefinitely continued, it is clear that no lamellar structure in any proper sense can be assigned to the mineral. All that can be affirmed is that contiguous atoms have less coherence along a direction normal to these planes than in other directions. When cleavage takes place in three directions, it of course produces a perfect crystal form, from which the system of crystallization and angular dimensions of the species may be determined, it is thus often of very great importance.

The common cleavage in the different systems is as follows, those of most frequent occurrence being in italics:—(1) In the cubic system, *Octahedral*, O, along the faces of the octahedron; *Hexahedral*, ∞O∞, along those of the cube; and Dodecahedral, ∞O. (2) In the tetragonal system, Pyramidal, P, or 2P∞; *Prismatic*, ∞P, or ∞P∞; or *Basal*, 0P. (3) In the hexagonal system with holohedral forms, Pyramidal, P, or P2; *Prismatic*, ∞P, or ∞P∞; or *Basal*, 0P; with rhombohedral forms, *Rhombohedral*, R; Prismatic, ∞R; or *Basal*, 0R. (4) In the right prismatic system, Pyramidal, P; *Prismatic*, ∞P; Macrodomatic or Brachydomatic, P̄∞ or P̄∞; *Basal*, 0P; Macrodiagonal, ∞P̄∞; or *Brachydiagonal*, ∞P̄∞. (5) In the oblique prismatic system, Hemipyramidal, P, or −P; *Prismatic*, ∞P; Clinodomatic, P^c∞; Hemidomatic, P^o∞ or −P^o∞; *Basal*, 0P; Orthodiagonal, ∞P^o∞; or *Clinodiagonal*, ∞P^c∞. (6) In the

anorthic system, Hemiprismatic, $\infty P'$, or ∞P; Hemidomatic either along the macrodome or the brachydome; *Basal*, 0P; Macrodiagonal, $\infty \breve{P} \infty$; or *Brachydiagonal*, $\infty \breve{P} \infty$.

In some minerals, as mica and gypsum, the cleavage is readily procured; these may be held in the hand and divided by a knife. Others only cleave with more or less difficulty; these must be placed on a firm support resting on lead, folded paper, or cloth, and a sharp blow struck on a chisel applied in a proper direction. This may often be ascertained by examining the specimen in a strong light. Sometimes it is necessary to subject them to extreme compression in a vice. Some of the hardest substances have not only a perfect but a facile cleavage, as cuclase, topaz, and diamond; many of the softest species have none. The planes produced also vary much in their degree of perfection, being highly perfect in some, as mica and calc-spar, and imperfect in others, as garnet and quartz. In a very few crystalline minerals cleavage-planes can hardly be said to exist. Cleavage must be carefully distinguished from the planes of union in twin crystals, and the division planes of laminar minerals.

5. *Fracture.*—This is the irregular manner in which substances may be broken. Even mineral possessed of cleavage may be fractured in other directions, but in amorphous bodies fracture alone occurs. The following varieties of fracture occur, and are highly characteristic.

1. *Conchoidal*, almost typical of amorphous bodies, but occasionally seen in crystals,—rounded cavities, more or less deep. The name is taken from the resemblance to the successive lines of interrupted growth in a bivalve shell. Seen in flint, obsidian, asphalt. In calcite the direction of this fracture is intermediate to the planes of the mineral's cleavage.

2. *Even*, when the surface of fracture is smooth and free from inequalities.

3. *Rough*, when the surface of fracture is rugged, with numerous small elevations and depressions.

4. *Splintery*, when covered with small wedge-shaped splinters.

5. *Hackly*, when the elevations are sharp, jaggedly bent, or jagged, as broken iron.

6. *Earthy*, when it shows only fine dust.

Taste, Odour, Touch

Taste belongs only to soluble mineral. The different kinds adopted for reference are as follows:

1. ***Astringent***, the taste of blue vitriol.
2. ***Sweetish astringent***, taste of alum.
3. ***Saline***, taste of common salt.
4. ***Alkaline***, taste of soda.
5. ***Cooling***, taste of saltpetre.
6. ***Bitter***, taste of epsom salts.
7. ***Sour***, taste of sulphuric acid.
8. ***Pungent***, taste of sal ammoniac.
9. ***Metallic***, taste of zinc sulphate.

Odour.—Excepting a few gaseous and soluble species, minerals in the dry unchanged state do not give off odour. By friction, moistening with the breath, and the elimination of some volatile ingredient by heat or acids, odours are sometimes obtained which are thus designated.—

1. *Alliaceous*, the odour of garlic. Friction of arsenical iron elicits this odour; it may also be obtained from any of the arsenical ores or salts by means of heat.

2. *Horse-radish odour*, the odour of decaying horse-radish. This odour is strongly perceived when the ores of selenium are heated.

3. *Sulphurous.* Friction will elicit this odour from pyrites, and heat from many sulphurets.

4. *Bituminous*, the odour of bitumen.

5. *Fetid.* the odour of sulphuretted hydrogen or rotten eggs. It is elicited by friction from some varieties of quartz and limestone.

6. *Argillaceous*, the odour of moistened clay. It is obtained from serpentine and some allied minerals after moistening them with the breath; others, as pyrargillite, afford it when heated.

7. *Empyreumatic* or *ozonic.* Quartz, when two portions strike one another.

Touch.—Some minerals are distinguished by a greasy feeling, as talc; others feel smooth, as celedonite; others meagre, like clay; others cold. This last character distinguishes true gems from their imitations in glass. Some, in virtue of their hygroscopic nature, adhere to the tongue.

Chemical Properties of Minerals.

Influence of Chemical Composition on the External Characters of Minerals.—That the characters of a compound must to a certain extent depend on those of its component elements seems, as a general proposition, to admit of no doubt. Hence it might be supposed possible from a knowledge of the composition of a mineral to draw conclusions in reference to its form and its other properties; but practically this has not yet been effected.

The distinction between the mineralizing and mineralizable or the forming and formed elements lies at the foundation of all such inquiries. Certain elements in a compound apparently exert more than an equal share of influence in determining its physical properties. Thus the more important non-metallic elements, as oxygen, sulphur, chlorine, fluorine, are remarkable for the influence they exert on the character of the compound. The sulphurets, for example, have more similarity among themselves than the various compounds of one and the same metal with the non-metallic bodies. Still more generally it would appear that the electro-negative element in the compound is the most influential, or exerts the greatest degree of active forming power. After the non-metallic elements the brittle, easily fusible metals rank next in power, then the ductile ignoble metals, then the noble metals, then the brittle, difficultly fusible, and, last of all, the metals of the earths and alkalies.

Generally each chemical substance crystallizes only in one form or series of forms. Some substances, however, show dimorphism, or crystallize in two forms, and thus any compound of two or more metals. Thus sulphur, which in nature usually crystallizes in the right prismatic system, when melted forms oblique prismatic crystals. Carbon in one form is the diamond, in another graphite, carbonate of lime appears as calc-spar, as arragonite; the bisulphuret of iron as pyrite and as marcasite. An example of trimorphism occurs in titanic acid, forming the distinct species anatase, rutile, and brookite. It is remarkable that of dimorphic minerals one form is almost always right prismatic, thus:

Isomorphic Pairs	
Cyanite, anorthic	Staurotide, Andalusite
Calc-spar, hexagonal	Arragonite
Sussexite, do	Kobellite
Rutile, Anatase, pyramidal	Brookite.
Prehnite, right prismatic	Pectolite
Cuprite, cubic	Chalcotrichite
Senarmontite, cubic	Valentinite
Pyrite, do	Marcasite
Rammelsbergite, do	Chloanthite.
Argentite, do	Acanthite
Ferrocyanate, oblique prismatic	Dichroite
Sulphur, do	Sulphur

Even the temperature at which a substance crystallizes influences its forms, and so far its composition, as seen in the case of Glauber salt, natron, and borax.

Isomorphism. Still more important is the doctrine of isomorphism, designating the fact that two or more simple or compound substances crystallize in one and the same form, or often in forms which, though not identical, yet approximate very closely. The similarity of form is generally combined with a similarity in other physical and mechanical properties. Among minerals that crystallize in the tesseral system, isomorphism is of course common and perfect, there being no diversity in the dimensions of the primary form; but for this very reason it is generally of less interest. It is of more importance among crystals of the other systems, the various series of which are separated from each other by differences in the proportion of the primary form. In these perfect identity is seldom observed, but only very great similarity.

The more important isomorphic substances are either simple substances, as (1) fluorine and chlorine, (2) sulphur and selenium, (3) arsenic, antimony, (4) cobalt, iron, nickel, (5) copper, silver, mercury, gold (?), or combinations with oxygen, as (6) lime, magnesia, and the protoxides of iron, manganese, nickel, (7) sesquioxides, as of iron, manganese, chromium, and titanium, (8) phosphoric acid, vanadic acid, arsenic acid, (9) sulphuric, selenic, chromic acids, or combinations with sulphur, as (10) sulphuret of iron and of zinc; (11) sulphuret of antimony and of arsenic, (12) sulphuret of lead, of copper, and of silver. These are sometimes named vicarious from the singular property that in chemical compounds they can mutually replace each other in definite proportions, and very often without producing any important change in the form or other physical properties. But there are numerous instances among the silicates where the mutual replacement of the isomorphic

bodies, especially when the oxides of the heavy metals come in the room of the earths and alkalies, and influence on the external appearance, particularly as regards colour, specific gravity, and fusibility. The varieties of hornblende, augite, and mica which contain the rarer elements are remarkable for the beauty of their crystals, which are sometimes enormously developed. Without the presence of these elements, the oxides of iron and manganese would have [illegible] the colour, would have

In the chemical formulæ, barred letters represent two equivalents of the element, and a dot over the symbol indicates the combination with three times its quantity of oxygen, as the terms are explained.

In the symbolic notation the several faces of crystals are separated by commas, and the constituent members of combination by colons. The letters on the faces of the figures are for the most part those adopted by Miller. In these combinations the crystallographic form which is typical of the mineral is placed first:

SIMPLE SUBSTANCES

1. Sulphur Group.

[illegible] Rhombohedral. Cleavage perfect [illegible], middle edge 144° 12′, basal P on P 101° 56′, oP on oP 120°. Usually granular, and also stalactitic or compact, and pulverulent. Cleavage basal and P. H. 1·5 to 2·5. G. 2·5. Fracture conchoidal or [illegible] Colour pale wax-yellow, passing into red, brown, or green. Yellow on the closed tube. Fuses at a temperature of 226° C. (439° F.), and burns with a pale blue flame. Soluble in carbon disulphide. Crystallized sulphur, and that precipitated from solution of chromium, and yellow sulphuret of antimony. Found chiefly in [illegible] formations. Fine crystals in Sicily, with celestine, gypsum, &c. Also in Switzerland, Greenland, Iceland, [illegible] in Solfatara near Naples, from [illegible], from sulphuret of zinc in New York, and in coal-beds, limestone, and pyrites at several localities.

Fig. 257.

(2) Selenium, Se.

Lead-grey but reddish brown by transmitted yellow. B.B. burns with blue flame and odour of sulphurous acid, and fuses with the sulphurous. Found in the crater of Volcano in the Lipary Islands, and Kilauea in Hawaii.

3. SULPHIDES.

H. 2·5. G. 6·1. Precisely black to lead-grey: thin splinters translucent and red. From Cuebras in Mexico.

4. Tetradymite, Te.

Rhombohedral. [illegible] 50′. In minute hexagonal prisms, with basal cleavage, and also massive and granular. Cl. lateral perfect. H. 2 to 2·5. G. 6·1 to 6·3. Tin-white; [illegible] Composition with a little gold and iron. Occurs at [illegible] Transylvania, and in several mines in Boulder county, Colorado, where 25 lbs. weight have been obtained [illegible].

Fig. 258.

Rhombohedral: R on R 105° 5′ (fig. 258). Usually in botryoidal investing masses composed of numberless layers. The structure is sometimes [illegible] granular. H. 3·5; G. 5·7 to 5·95. Cl. basal. Colour black, and dull, but when fresh broken very [illegible] and [illegible] white. Fracture uneven. When rubbed or heated gives out a garlic-like odour. B.B. volatile with formation of white fumes. Composition with some antimony, and traces of iron, silver, and gold. Andreasberg in the Harz, Annaberg, Schneeberg, Freiberg, Joachimsthal, Allemont (Dauphiné), Kongsberg (Norway), the Altai, Chili, Pebble mine (Dunbridge, Tyndrum (Perthshire).

6. Antimony, Sb.

Rhombohedral; R on R 87° 35′, but rarely crystallized, generally in foliated or granular masses. Cl. basal. H. 3. G. 6·6 to 6·8. Tin-white, with a yellowish tarnish. Brittle and sectile. B.B. easily fusible, volatilizes, and on charcoal leaves a white deposit, burning with a pale flame. Found at Andreasberg, Przibram (Bohemia), Sala (Sweden), Allemont, Southham in East Canada, and Borneo.

7. Allemontite, $SbAs_2$.

Hexagonal, spheroidal, reniform, and investing. H. = 3·5; G. = 6·1 to 6·2. Lustre, when fresh metallic. Tin-white to lead-grey, but with a blue or brown tarnish. B.B. strong odour of garlic, with [illegible] of oxide of antimony. Composition: antimony 37·85, arsenic 62·15. Almost always in curved foliated lamina. Occurs at Allemont, Przibram, Schladming; in Styria, Andreasberg.

8. Bismuth, Bi.

Rhombohedral, R on R 87° 40′. Crystals, R, 0R, generally distorted and reticulated, pearl-like twins, or arborescent; also disseminated and granular. Cl. basal perfect. H. 2·5; G. = 9·6 to 9·8. Brittle and sectile. Reddish white, often tarnished grey, brown, or blue. F.B. easily fusible, even in candle flame. Volatilizes on charcoal, leaving a yellow crust. Sol. in n. acid; solution precipitated when thrown into water. Occurs in gneiss and clay-slate in veins and disseminated, along with ores of cobalt, silver, lead, and zinc. Alston Moor, Cumberland, Devonshire, and Cornwall. Schneeberg, Marienberg, Joachimsthal, Biebe, Modum (Norway), Falun (Sweden), Bolivia.

9. Tetradymite, Bi_2Te_3.

Bismuth glance, Schirmm 18. Virginia, Dahlonega in Georgia, Montana. A variety with 7 per cent. of selenium and H. = 2 also occurs.

10. Tetradymite, Bi_2Te_2S.

Rhombohedral; 3R 68° 10′. Almost always twins of 3R and 0R, with the faces of 0R at 93°. Cl. basal, perfect. Sectile, and thin lamina flexible. H. = 1 to 2; G. = 7·2 to 7·5. Steel-grey. By rubbing, yielding a grain of metal which ultimately volatilizes. Some massive. Composition: 59·6 bismuth, 35·9 tellurium, and 4·5 sulphur. Schemnitz.

11. Weibullite, $Bi(Te_3S)$.

Hexagonal. Cl. basal. H. = 1 to 2; G. = 8·14. High lustre. Steel grey. C.c.: bismuth 61·15, tellurium 29·74, sulphur 2·33, silver 2·07. Deutsch-Pilsen in Hungary.

12. Joseite, $Bi_3Te_2(SSe)_2$.

Hexagonal. Cl. basal. G. = 7·93. Colour grey black to steel-grey. Brittle. C.c.: tellurium 15·93, sulphur 3·15, selenium 1·48, bismuth 79·15. San José (Brazil). A Cumberland variety yielded tellurium 6·73, sulphur 6·13, bismuth 84·33, corresponding to $Bi_4(TeS_4)$.

13. Diamond, C.

Var. 1. *Crystallized.*—Cubic; very frequently hemihedral. Crystals most generally with curved faces. Twins common on octahedral face; hemitropes also common (see fig. 170, 204, 207). Crystals vary remarkably in appearance, each [illegible] Cl. octahedral. H. 10; G. = 3·5 to 3·6. Transparent or translucent when of dark colour. Refracts light treely. The black plane diamonds reflect all the light which strikes them at an angle exceeding 21° 13′, and hence comes their peculiar brilliancy. Has adamantine lustre. Colourless, but often tinged with brown,—more rarely yellow, pink, blue, green, and black, the last named being the rarest. Disperses light lavishly, and brilliant flashes of all the colours of the spectrum. Becomes negatively electric by friction. B.B. infusible, but burns away

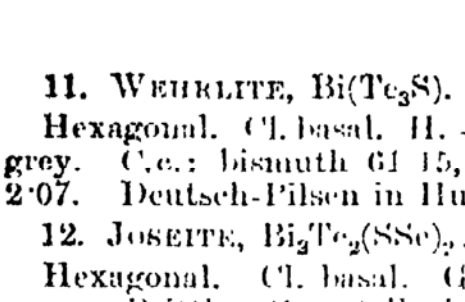

Fig. 259.

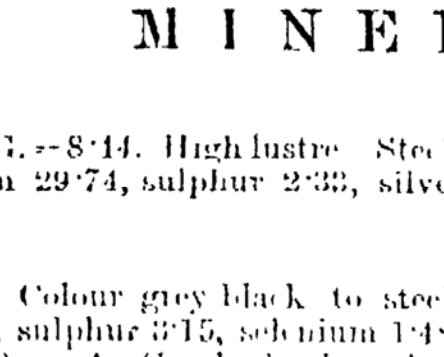

Fig.

acid in oxygen gas. When air is excluded it can be heated at the temperature of melting cast iron, but at that of melting malleable iron is changed into a black coke, or, if air is admitted, into graphite. Insoluble in all acids and alkalies. C.c.: carbon with traces of silica and earths. Geologic formation apparently a limonitic flexible quartz rock called itacolumite, which occurs in Brazil, the Urals, Georgia, and North Carolina, in the vicinity of places where diamonds have been found. Minute crystals have been found in xanthophyllite, and in talc slate and serpentine on the Schischimskian hills near Zlatoust (Russia). They have also been obtained in Brazil imbedded in a conglomerate composed of much worn pebbles of quartz, chalcedony, and gold, cemented by limonite or

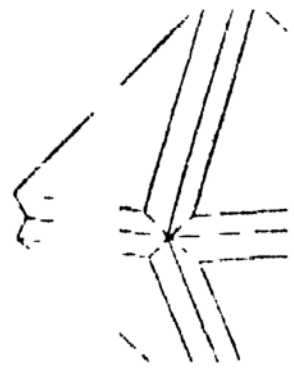

Fig. 261

Fig. 262.

ferruginous clay. In South Africa they are imbedded in [illegible] clay. Diamonds were formerly obtained in India, at Panna, Raolconda, and Golconda. So few are now obtained here that the mines are let for £1 a year. From these mines were obtained not only the Kohinoor, which was possibly the same as the great diamond mentioned by Tavernier as having been seen by him in the possession of the Great Mogul, which weighed 280 carats, but the Regent, of 136 carats (which, not only from its size, but from the perfection of its form, is very much the finest diamond known), the Nizam, an uncut diamond of 340 carats, and the Orlow rose cut, 193 carats. More lately diamonds were found in great quantity in the neighbourhood of Rio Janeiro in Brazil; they occur in two different deposits: the one called "gurgulho" consists of broken quartz covered by a bed of sand; the other, "cascalho," consists of rolled quartz pebbles united by ferruginous clay: both rest on talcose clays, which are the debris from talcose rocks. The first deposit affords the finest diamonds, and both contain gold, platinum, magnetite, and rutile. A dodecahedral diamond of 257 carats was lately found at Bogagem in this district; this was reduced by cutting to an oblong brilliant of 129 carats, a [illegible] the second most valuable diamond,—the Kohinoor, now re[illegible] to an imperfectly circular brilliant of 102 carats, occupying third place. The two coloured diamonds most worthy of [illegible] are a green diamond in the Dresden collection weighing 51 c[illegible] which is a little deeper in tint than a beryl, and a blue dia[illegible] in the Hope collection, of 44 carats, a highly coloured [illegible] sapphire, which it is by some considered to be. Diamonds [illegible] lately been found in very fe[illegible] e of great [illegible] north of the Cape of Good Hope; these for th[illegible] most part [illegible] yellow colour and of very inferior value. Wh[illegible] a Brazilian [illegible] brilliant of one carat is worth from £30 to [illegible], the va[illegible] the finest brilliants from the Cape is only from [illegible] to £4, and [illegible] of the yellow diamonds is from £2 to £[illegible]. Apart fro[illegible] employment as an ornamental stone, the diamon[illegible] has in nat[illegible] value from it being utilized for cutting [illegible] an[illegible] grinding [illegible] polishing other gems. Of late years it ha[illegible] has had [illegible] application to [illegible] been employed for the drilling of [illegible] can now be [illegible] operation, and in the boring of artesian well[illegible] in the [illegible] tion has resulted from the latest methods of w[illegible] by the [illegible] that the lustre of the African diamonds, a[illegible] to [illegible] of their endurance, is certainly not [illegible] to that of the Brazilian [illegible]. So much is this recognized that while the best [illegible] minute crystal, of the latter commands a price of 50 per carat, [illegible] African can be got for about £1. The circumstance that [illegible] African diamond [illegible] ornament that even the best of the Brazilian [illegible] some of them to fall in price. Such diamonds, generally octahe[illegible] may be recognized by a peculiar watery lustre, they are called [illegible] diamonds. The above facts give some ground for the supposi[illegible] that there may be a distinct difference between the two varieties, pos[illegible] that both may contain small, but different, quantities of foreign [illegible]. The circumstances under which diamonds have been formed [illegible] altogether unknown. The fact of their being changed into a [illegible] of coke at a very high temperature is an argument against [illegible] having been produced through the operation of heat, and it has [illegible] been known that an excess of carbon dissolved by molten cast [illegible] crystallizes on cooling in the form of graphite, yet the only attempts [illegible] to form diamonds deserving of being mentioned have hitherto [illegible] attended with any measure of success are those in which [illegible] charcoal was dissolved in molten silver at the temperature of [illegible] melting steel. There [illegible] th[illegible] e black [illegible] also colourless octahedral [illegible] with e[illegible] faces, mingled with a [illegible] er amount [illegible] dal crystals.

Var. 2. *Bort*. [illegible] of [illegible] sometimes 1000 carats. [illegible] H. 10, G. = 3·012 to [illegible] C. carbon except [illegible] Found in [illegible] mines of Brazil, &c.

Var. 3. *Ballas*. [illegible] The diamond [illegible] In mammillar[illegible] mas[illegible] and globu[illegible] Brittle. Cl. [illegible] P.G. [illegible]. When cut and polished [illegible] Supposed from Brazil.

14. Graphite, C.

Hexagonal in that [illegible] L[illegible] scaly, or compact. Cl. [illegible] metallic. Colour and [illegible] to dark [illegible] thin lamina, very sectile, feels greasy; leaves a mark on paper of its own colour, conducts electricity. B.B. burns with difficulty, heated with nitre, [illegible] deflagrates. C.c.: carbon, with small quantities of vegetable matter, and ash from 5 to 10 per cent. Strathfarrar (Inverness-shire), Mull, Cruegnan (Ayrshire), Borrowdale in Cumberland, Caithness, Mountains, Ceylon, Greenland. Used for making pencils.

Fig. 263.

15. Tin, Sn.

Tetragonal [illegible] grey or white metallic grains. Reported occurring with Siberian gold, with bismuthite from Guanajuato, Mexico.

16. Iron, Fe.

Cubic; in grains and plates or disseminated. H. 4·5, G. = 7 to 7·8. Steel grey or iron black. Fracture hackly, magnetic. B.B. infusible. Sol. in hot acid. Two varieties are to be distinguished. (*a*) *Telluric iron*, in grains and plates. Almost pure iron, or contains graphite, carbon, lead, or copper, or nickel. Found in Bohemia in lime[illegible] stone, in the clay-slate and sandstone in the Lesper at Mühlhausen; in Tuscany in clay-slate, in Greenland, in an ironstone conglomerate in Disco, and in lava in Auvergne, in the mine of Hackenburg at Bodenmais, in Lib[illegible] Africa along with quartz, a zeolite, and magnetite, enclosed in [illegible] serpentine in Unst (Shetland) and in Sutherlandshire, in basalt in Antrim Ireland, in the gold sands of Brazil, the Urals, and C[illegible] plain, Pennsylvania). (*b*) *Meteoric iron*, sterlingy or silver w[illegible]

lways contains nickel, with cobalt, copper, and several which are non-terrestrial. When polished and etched ic acid the surface is marked by lines of unaffected inter- ystals called Widmannstatten's figures, most of the nickel nd the a Occurs in masses which vary in size from le ...to cop- dust as dredged from the depths of the o... ...d of 22,050 lb. ...URY, Hg.

...Occurs in small liquid globules in its gangue, but may ...also, when it forms octahedral crystals. G. = 13·596 ...(−39°·2) when solid. Lustre brilliant metallic, tin- ...white, sometimes leaving a little tarnish. Readily ...occurs generally in clay-slates or schists of dif- ...ferent periods. Ores of mercury are usually found in veins ...accompanying calomel, at most of the localities for ...which are Idria in Carniola and Almaden in Spain. ...Cinnabar is worked in a soft clay slate. In Transylvania ...it comes from the Carpathian sandstone beds. At the Pioneer mine in California some ...of the specimens are coated with globules of mercury. At Cividale ...nearly all the cinnabar has become metacinnabar. It has also been ...found in crystals, and has even been stated to have ...occurred in a pseudomorph.

...VER, Ag.

...ings. 26, 30, 33, 35, 36, 37) ... generally small, also and ...quently filiform, arborescent, ... plates or crusts. These ...exist into cavities, coating the ..., or rarely in a reticu- ...lation throughout the mass of ... Twins of octahedral ...dihedral composition. H. 2·5 to 3; G. 10·1 ...Lustre metallic. Colour and ... white, but generally ...yellow, brown, or black. Malleable, ductile, and sectile, ...than gold. B.B. ... Sol. in ... ..., ...tion colours the skin black ... silver, with varying proportions of gold, platinum, mercury, copper, antimony, and bismuth. The auriferous from Norway contains silver 72, gold 28; from quartz reefs in Sutherland, silver 71·4, gold 28·6. The cupriferous from Courcy near Caen contains 10 per cent. of copper. The antimonial from Bohemia contains 1 per cent. of antimony. The mercurial from Kongsberg in Norway has ·4 of mercury, found chiefly in veins in gneiss, clay slate, and limestone. Localities: Alva and elsewhere in Scotland, Ballycorus in Ireland, and Cornwall in England; at Freiberg, Andreasberg, and Kongsberg; along with native copper at Lake Superior; in Mexico, in Peru, and in the United States. The finest crystallized silver occurs at Lake Superior, and at Kongsberg. At the last locality the crystals are an inch in diameter, and are disposed on large filiform brushes. Silver occurs in large masses; three of 436, 560, 812 lb have been recorded from Kongsberg. A block which smelted 44,000 lb was for some years used as a table by Duke Albert on his annual visits of inspection to the Schneeberg mine in Saxony. A Mexican specimen was found of 400 lb; the mines of Huantaya in Peru have yielded masses of 444 and 960 lb. Britain produces annually about 760,000 oz. of silver, chiefly, however, from lead ores. The value of annual produce for the whole world from all sources is from 8 to 10 millions of pounds sterling.

22. SCHNEIDERITE (*Gold Amalgam*), Au_2Hg_3.

Tetragonal four-sided prisms, easily crumbling, yellowish white to white; sometimes in grains the size of a pea. C.c.: gold 41·63, mercury 58·37. Found at Mariposa in California. A variety $(Au, Ag)_2 Hg_3$ is found along with platinum in Columbia; this contains gold 38·39, silver 5, mercury 57·40.

23. ARQUEROITE, Ag_2Hg.

Cubic. In octahedra, also in grains and dendrites. G. = 10·8. Like native silver, but softer. C.c.: silver 86·5, mercury 13·5. From Arqueros in Coquimbo, Chili. *Kongsbergite*, $Ag_{18}Hg$, occurs at Kongsberg, with 95·1 of silver and 4·9 of mercury.

24. AMALGAM, Ag_3Hg_2 and $AgHg_3$.

Cubic (fig. 33, in combination with 40, 30, 41, 38). Cl. dodecahedral. H. 3 to 3·5. G. 10·5 to 14. Colour and streak silver-white. Fracture conchoidal, brittle, grates when cut. In closed tube yields mercury and leaves silver. Sol. in n. acid. The first variety (silver 34·8, mercury 65·2) occurs at Moschellandsberg in the Palatinate, where the veins of mercury and silver intersect another, the second (silver 26·25, mercury 73·75) there, at Allemont in Dauphiné, Almaden in Spain, in Hungary, and in Sweden. From Rosilla in Atacama (Chili) Domeyko reports the following other compounds: Ag_3Hg_4, silver, mercury 53·2, white and silvery; $AgHg$, silver 55·1, mercury, granular and dull, Ag_2Hg_3, silver 64·2, mercury 35·8; of the last there is a mass weighing 22 lb in the museum of Santiago.

25. GOLD, Au.

Cubic (figs. 30, 26, 33, 40, 36) and more complex forms. Crystals ...erally small and indistinct through elongation, assuming capillary ...and arborescent shapes. Also in thin plates. Twins rare; twin face ...octahedral. Frequently in rounded and apparently colloidal masses ...imparted in clay, or loose in small grains (pipettes) rolling in the ...bed of streams. Fig. 265 is of such a mass found in Sutherland. H. 2·5 to 3, G. 17 to 19·4. Lustre metallic, but frequently dull and partly coated with a brown crust. Colour and streak yellowish white to bright gold-yellow. Malleable, ductile, and sectile; the purer varieties the more so and the softer. B.B. easily fusible. Sol. in aqua regia, generally with precipitation of chloride of silver. Solution yellow, stains skin purple-red, with corrosion. C.c.: gold, with silver from ·72 to 26 per cent.; sometimes iron and copper under 1 per cent. Found in beds and veins generally of quartz in metamorphic rocks of a schistose nature, rarely in diorite and porphyry, and very rarely in granite. Its general associate ...mineral, formed from decomposition of pyrite; sometimes also hæmatite and magnetite. Occurs also in microscopic grains in quartz, from which it is extracted by crushing and amalgamation. The geological range is from the Azoic to the Tertiary and Cretaceous, as in California, but even in these more recent rocks the original source must have been at least Palæozoic. Of localities which yield gold the following may be noticed:—the Leadhills in Scotland, Wicklow in Ireland, Dolgelly in North Wales, Cornwall in England; Transylvania, Hungary, and Piedmont; the Urals, Ekaterinburg, and India; Kordofan, the coast opposite Madagascar, and the Gold Coast (the fame of which has been recently revived); Minas Geraes in Brazil, Bolivia, North Carolina, and

Fig. 265.

ia ; and more recently New South Wales and Queensland
ralia, Tasmania, and New Zealand.
of the largest single masses of gold found in recent times are
owing:—one of 22 oz. in Transylvania, of 28 lb in North
, of 20 lb in California, one of 96 lb troy near Miask in the
nd one of 184 lb 8 oz., which yielded £8376, 10s. 6d., at
. Australia.
nnual produce of gold from Australia is about 5 millions of
sterling, of the United States about 15 millions, and the
arth about 23 millions.

ollowing sub-species may be noticed :—

lectrum. This name for the alloys of gold and silver
olied by Pliny, whenever the proportion of the latter
as one-fifth. An alloy of 2 gold and 1 silver contains 21 per
silver; this is found in Sutherland. One of 1 to 1 contains
cent. of silver, this last being the most usual proportion
rs in Transylvania, in the Altai, and in Colombia. It,
s brass yellow to yellowish white. G. = 12·5 to 15·5.

rpeite, or *Palladium Gold* (*auro-paladre*), from Porpez in
ontains 9·85 per cent. of palladium and 4·17 of silver.

odium Gold, from Mexico (G. = 15·5 to 16·8), contains from
per cent. of rhodium.

LATINUM, Pt.

; rarely in small cubes or octahedrons, usually in minute
ains, sometimes cohering, and also in rounded lumps. No cl.
4·5; G. = 17 to 19. Lustre metallic. Colour and streak pale
y. Malleable and ductile with difficulty, having a hackly
. When containing much iron, magnetipolar. B.B. in-
. Sol. in aqua regia, but only when heated, solution red;
the skin. C.c.: platinum, but never to a greater extent
·5 per cent. The remainder consists of iron, iridium, rhodium,
m, osmium, gold, copper, and a mechanical mixture of min-
. The iron exists in quantities varying from 1·7 per cent. to
that amount. Occurs in Brazil in syenite, near Popayan
ca) in alluvium, associated with chromite, rutile, palla-
gold, and copper; in the Urals in alluvium derived from
ine rocks; and at Nijni Tagilsk in serpentine along with
e. It is also found in Borneo, California, and Carolina, and
to have been found in the county of Wicklow in Ireland.
ds of many rivers yield it in small amount. Platinum does
r in large masses. A mass in the Madrid Museum from
weighs 26½ oz.; masses have been found in the Urals from
lb.

Platina is a sub-species. This, which has a composition
and contains from 11 to 13 per cent. of iron, is found at
agilsk. G. = 14·6 to 15·8, H. = 6. It is magnetipolar, and
iron much more strongly than an ordinary magnet.

PLATINIRIDIUM.

inute silver-white grains. H. = 6 to 7, G. = 16·94 to 22·8.
s 55·44 platinum, 27·79 iridium, 6·86 rhodium, 4·11 iron,
per, ·49 palladium. Is found in Brazil.

RIDIUM, Ir.

(fig. 27). H. = 6 to 7; G. = 21·57 to 23·46. Cl. cubic, traces.
ightly malleable. Silver-white to steel-grey. B.B. in-
. Insoluble in all acids. C.c. 76·8 iridium, 19·61
m, 0·89 palladium, 1·78 copper. Found at Nijni Tagilsk,
y in minute grains. Is the heaviest known substance.
s, sub-species. From Ava in India. C.c. 60 iridium,
nium (according to Prinsep).

PALLADIUM, Pd.

; in minute octahedrons, and in grains. H. = 4·5 to 5; G. =
11·8. Malleable. Light steel-grey. B.B. infusible. Slowly
s in n. acid, forming a brown-red solution. C.c., palla-
with a little platinum and iridium. From the gold sands
il, often in small plumose crystalline lumps. Also from St
go, and the Urals. Does not tarnish with sulphurous fumes.

ALLOPALLADIUM, Pd_3.

gonal; in small flat hexagons. Cl. basal, perfect. Lustre
silvery. Colour pale steel-grey. From Tilkerode in the
with gold.

NEWJANSKITE (*Osmiridium*), IrOs (iridium 49·78, osmium
and Ir_2Os.

gonal; P 124°. 0P, P, ∞P. Generally in flat scales.
al perfect. H. = 7; G. = 18·8 to 19·47. Lustre metallic.
tin-white. B.B. unchanged. Insoluble
ids. The analyses of this mineral give
ies of iridium varying from 44 to 77 per
nd of osmium from 21 to 49. Ruthenium,
n, and platinum make up the 100 parts.
rgest quantity of ruthenium is 8·49, and

Fig. 266.

iety from New Granada was found to contain no ruthenium,
3 of rhodium, which is more than double its usual amount.
with platinum in Choco (Colombia); at Newjansk and
several localities in the Urals, in Australia, in northern C
(somewhat abundantly in gold sands), also in Canada.

32. SISSERSKITE (*Iridosmium*). $IrOs_4$ (iridium 19·9, osmi
and $IrOs_3$ (iridium 24·8, osmium 75·2).

Rhombohedral; R = 84° 28′. H. = 7·5; G. = 21·12. Col
grey to bluish. B.B. becomes black, with strong odour
acid; in flame of spirit-lamp shines strongly, and colou
yellowish red. Occurs in small quantity with newjanskit
its localities, and in proportionally larger quantity at Sissers
Urals. It is used for pointing gold pens, and in the Unite
sells at 50 dollars an ounce.

COMPOUNDS OF FLUORINE, CHLORINE, BROM AND IODINE (HALOID SALTS).

33. FLUORITE (*Fluor-spar*), CaF.

Cubic (figs. 267 to 270, also figs. 31, 33, 36, 55, 56, 57, 5
divergent crystalline, granular, and compact. Cl. octa
fracture conchoidal, brittle. H. = 4; G. = 3·1 to 3·2. Tra
to pellucid. Lustre vitreous. Colourless, but generally
purple, blue, green, yellow, white, black, and pink. So
two or three colours disposed in layers in one crystal. Fr

phosphoresces with different tints of light, when heated. I
crepitates and fuses to an opaque bead. Sol. in acid with c
of hydrofluoric acid. C.c. of Ca: calcium 48·7, fluorine
mines, generally associated with metallic ores. Shetland,
land, on the Avon, and Bulaton in Scotland; Cum
Northumberland, Derbyshire, and Cornwall; Saxony, I
Freiberg. Used to be turned into vases and other ornament
John"); formerly employed as a flux, now for etching and o
glas

34. YTTROCERITE

In crystalline crusts. H. = 4 to 5, G. = 3·4 to 3·5. Tran
vitreous. Violet blue to grey or white. B.B. infusible.
fluorine when heated with sulphuric acid. C.c.: fluorides o
yttrium and calcium. Finbo and Broddbo near Falun; M
Massachusetts and New York.

35. FLUOCERITE, CeF = Ce_2F_3.

Hexagonal. H. = 4 to 5, G. = 4·7. Opaque or translucen
edges. Pale brick-red or yellowish, streak yellowish whit
infusible. In close tube gives out hydrofluoric acid. C
peroxide of cerium, 1·12 yttria, 16·24 hydrofluoric acid
and Broddbo.

36. FLUOCERITE, $Ce_2F_3 + (Ce_2O_3 + H_2O)$.

Massive, fracture conchoidal. H. = 4·5 to 5. Opaque.
Bright yellow to reddish brown; streak brownish yellow
infusible, darkens with the heat; colour restored on cooling
cerium 17·6, fluorine 10·9, sesquioxide of cerium 66·4, w
From Finbo.

37. BASTNAESITE, $Ce_2F_3 + Ce_2O_3 + 4H_2O$, and

38. HAMARTITE, $2(LaO, CeO)3CO_2 + CeF_3$, are similar. T

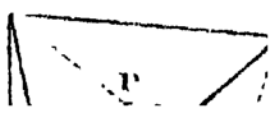
easily. Sol. in n. acid. C.c. : chloride of lead 40, protoxide of lead 60. Mendip Hills, and Brilon in Westphalia.

68. Schwartzembergite, PbI + 2PbO.

Rhombohedral ; in thin crusts. H. = 2 to 2 [illegible]. Adamantine. Honey-yellow. Desert of Atacama.



69. Atacamite, $CuCl + 3CuO, H_2O$.

Right prismatic ; ∞P (*M*) 112° 25′, P∞ (*I* 1[illegible] 0′. ∞P∞ (*h*) (fig. 275); also reniform. Cl. *h* perfect. Semitransparent ; vitreous. Emerald-green ; streak apple-green. B.B. fuses, leaving copper. Easily soluble in acids. C.c. : copper protoxide 55·85, copper 14·86, chlorine 16·61, water 12·68. Atacama, Chili ; Tarapaca, Peru ; Bolivia ; Burra-Burra, Australia ; Serra de Bembe, Ambriz, Africa : Vesuvius and (?) Etna.

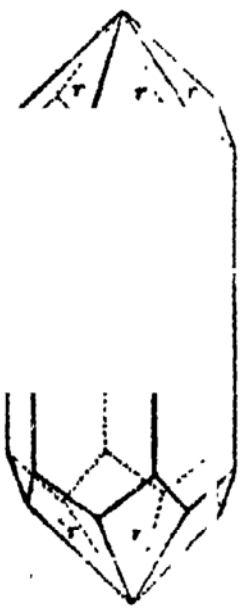


Fig. 276 (sp. 72).

70. Tallingite, $CuCl, H_2O + 4CuO, H_2O$.

In crusts. H. = 3 ; G. 3·5. Bright blue to greenish blue. Translucent ; brittle. Botallack in Cornwall.

71. Percylite, (PbCl + PbO) + (CuCl + CuO).

Cubic (com. of figs. 26, 30, 33, 36). H. = 2. Vitreous. Sky-blue. Sonora in Mexico.

72. Connellite.

Hexagonal (fig 276). *b* : *b* 145° 10′ ; *r* : *r* 13° 50′. Crystals acicular. Vitreous ; translucent. Vitriol-blue. [illegible] chlorida and sulphide of [illegible]

OXIDES OF METALS.

1. Suboxides and Protoxides.

73. Cuprite, Cu_2O.

Cubic (figs. 22, 30, 33, 26, with 39, 40). Compact and granul[illegible] Cl. octahedral ; brittle. H. = 3·5 to 4 ; G. = 5·7 to 6. Transparent and opaque ; adamantine. When transparent, crimson ; when opaque, cochineal or brick-red. Often tarnished grey. B.B. becomes black, fuses, and is reduced on charcoal. Soluble in acids and in ammonia. C.c. : 88·9 copper, 11·1 oxygen. Cornwall, Siberia, Banat, Chessy near Lyons, Linares in Spain, Urals, South Africa, Burra-Burra. Valuable copper ore. *Chalcotrichite* consists of cubes elongated so as to become fibrous. Tile-ore is a ferruginous variety. Hepatic copper, liver ore, or pitchy copper ore seems to be a product of the decomposition of chalcopyrite. *Delafossite*, $Cu_2O + Fe_2O_3$, from Bohemia and Siberia.

74. Water, H_2O.

Hexagonal, when solid, in complex twins in snow crystals ; rhombohedric by cleavage, in ice. H. = 1·5 ; G. = ·918. Hence 100 of water = 1089·5 of ice, or water expands $\frac{1}{11}$th in freezing. Transparent ; vitreous. Colourless, but in bulk pale emerald-green. R 117° 23″. Cl. basal. Water when pure colourless, in mass bluish green. Occurs in centre of geodes of chalcedony in China [illegible] of [illegible] in [illegible] rs in solution, has G. = 1·027 to 1·0285. Waters of saline lakes contain sometimes 26 per cent. of salts, and have G. 1·212. Besides its vast bulk in the ocean, water occurs in enormous amount in the solid form, often as water of crystallization in rocks and minerals, *e.g.*, zeolites. Igneous rocks in some districts are converted largely into saponite, which contains 25 per cent. of water. Water is the standard for specific gravities of solids and liquids ; 1 cubic inch at 60° F. and 30 inches of the barometer weighs 252·458 grains ; 1 litre weighs 1000 grammes.

75. Periclase, MgO.

Cubic ; in cubes and octahedrons. Cl. do. H. = 6 ; G. = 3 to 3·75. Transparent ; vitreous. Grey to dark green. B.B. infusible. Sol. in acids. C.c. : magnesia, with 6 to 8 of iron oxide. Somma.

76. Bunsenite, NiO.

Cubic ; in octahedrons. H. = 5·5 ; G. = 6·4. Vitreous. Pistachio-green. Johann-Georgenstadt.

77. Zincite, ZnO.

Hexagonal and granular. Cl. basal. H. = 4 to 4·5 ; G. = 5·4 to 5·5. Adamantine ; translucent. Blood- or hyacinth-red ; streak [illegible]

80·26, oxygen 19·74 ; sometimes with manganese pe[illegible] Valuable ore of zinc. Franklin and Sterling in New Jersey.

78. Massicot, PbO.

Massive ; scaly crystalline. H. = 2 ; G. = 7·8 to 8. Sulp[illegible] lemon-yellow ; often contains iron. Popocatepetl in Mexico

79. Melaconite, CuO.

Cubic ; compact. H. = 3 to 4 ; G. = 6 to 6·3. Black. infusible ; so[illegible] in acids. Cornwall, Leadhills, Lake Su[illegible] Burra-Burra.

80. Tenorite, CuO.

Oblique prismatic, occurs in thin scales of metallic lustre [illegible] of Vesuvius. Colour black and dark-grey.

2. Sesquioxides.

81. Corundum, Al_2O_3.

Hexagonal ; R 86° 4′. Twins common. Cl. rhombohedral basal. Excessively tough, and difficultly frangible. H. = 9 ; G. = 4 to 4·2. Transparent or translucent ; vitreous, but pearly to resinous on basal face. B.B. unchanged. As *Corundum*, white, grey, greenish, frequently with bronzy lustre on basal face. C.c. : alumina with a little peroxide of iron. China, Ceylon, Bohemia, Macon in North Carolina (one crystal 300 lb weight). *Emery* compact, crystalline, granular ; grey to indigo-blue. Asia Minor, Naxos, Spain, Greenland, America. Corundum is used when cut for cutting and polishing gems in China and India, emery in general for grinding. Alumina occurs also in a purer state in transparent crystals of various tints of colour. When red and of the colour of pigeon's blood they are termed *Rubies* ; these come from Syriam in Pegu, Ava, Ceylon, Bohemia, and near Expailly. When 5 carats in weight a ruby is twice the value of a diamond of the same size, when 10 carats three times the value. When blue the crystal is the *Sapphire*, found chiefly in Ceylon and Pegu ; when green it is the *Oriental Emerald*, when yellow the *Oriental Topaz*, when purple the *Oriental Amethyst*, the a[illegible] here distinguishing them from the true or occidental stone[illegible] same name. Other tints of colour also occur, but with the [illegible]tion of the red and blue they are seldom pure or deep. Th[illegible] when cut with a hemispherical dome sometimes displays rayed star, either of a bright gold or a silvery white colour, greyish blue ground. These receive the name of *Asteria Sa[illegible]* The same crystal frequently shows portions of even three [illegible] tints. When perfectly devoid of colour, they are called *Sapphires* ; such are little inferior to the diamond in bri[illegible] but do not disperse rays of light to the same extent.

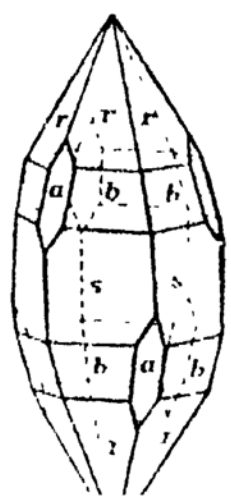

Fig. 277.

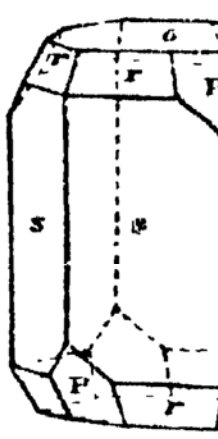

Fig. 27[illegible]

82. Hæmatite, Fe_2O_3.

Hexagonal and rhombohedral ; R 86°. Crystals rhombo[illegible] prismatic, and tabular. Twins with axes parallel. Cl. R, and fracture conchoidal ; brittle. H. = 5·5 to 6·5 ; G. = 5·1 [illegible] Opaque, but in thin lamina transparent and blood-red. [illegible] metallic lustre, iron-black to steel-grey, often brilliantly tarn[illegible] red, yellow, green, and blue tints ; streak cherry red. B.B. in the outer flame becomes black and magnetic. Sol. in acids. C.c. : iron 70, oxygen 30. The following are varietic[illegible] subdivisions :

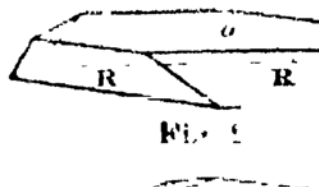

Fig. 279.

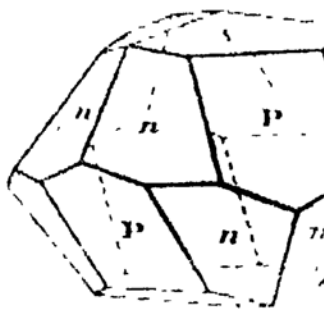

Fig. 280.

Elba Iron Ore, highly modified rhombohedral crystal often brilliantly tarnished. *Specular Iron Ore*, in thin flat crystals, often from volcanoes, as on the island of Ascension ; this variety includes *Micaceous Iron*, thin, lamellar, and curved, and *Red Iron Froth*, scaly. *Red Hæmatite*, in botryoidal and stalactitic forms, which are internally composed of radiating fibres, and often have a concentric structure ; the external surface has red to a brownish red hue. *Compact* and *Ochrey* varieti[illegible] more or less aluminous impurity, pass into *Reddle* or red ch[illegible] when still more earthy into jaspery and columnar ores. Th[illegible] very commonly distributed :—micaceous iron at Pitfichie in A[illegible] [illegible]rnam in Perthshire ; red hæmatite at Leadhills

on in Lancashire, specular iron at Tavistock in Devonshire Cumberland. *Ilmenite* seems to be the same substance in morphic after magnetite; it occurs in octahedra in Bute, d (Vosges), New York, and Brazil.

AMENITE, $FeTiO_3$.

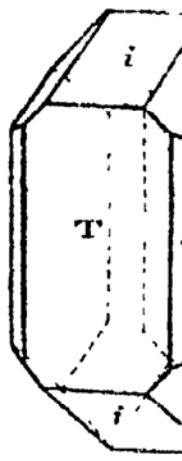

Fig. 284 (

91. CHRYSOBERYL, GlO, Al_2O_3.

Right prismatic (fig. 284). Twins common, united by a face of P∞ (fig. 285, also 156). Cl. brachydiagonal imperfect, macrodiagonal more ...o, fracture conchoidal. H. = 8·5; G. = 3·68 to ...8. Transparent or translucent; vitreous. Greenish white, leek green, and dark emerald-green. B.B. infusible. Not affected by acids. C.c.: glucina 20, alumina 80. Brazil, Ceylon, India, the Urals, Haddam in Connecticut. A very valuable gem. It sometimes possesses an opalescent band, which when the stone is cut *en cabuchon* appears as a streak of floating light; whence it derives its name of *Cymophane*. It is then also called the chatoyant or Oriental chrysolite, and when fine is of extreme value. The emerald-green variety, or *Alexandrite*, is columbine red by transmitted light.

NATASE, TiO_2.

idal; pyramids dominant. P 136° 36′ (fig. 288). Cl. and P, both perfect; brittle. to 6; G. = 3·8 to 3·93. Trans- o opaque; lustre adamantine to Indigo-blue, yellow, brown, olourless; streak white. B.B. . Sol. in hot s. acid C.c.: eid, with a little iron and rarely rnwall and Devonshire, the Alps, é, Valais, the Urals, Minas Brazil).

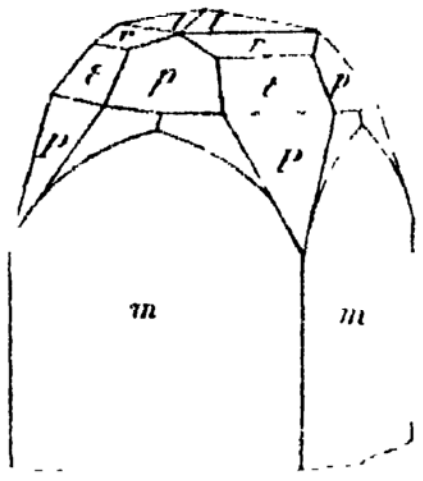

Fig.

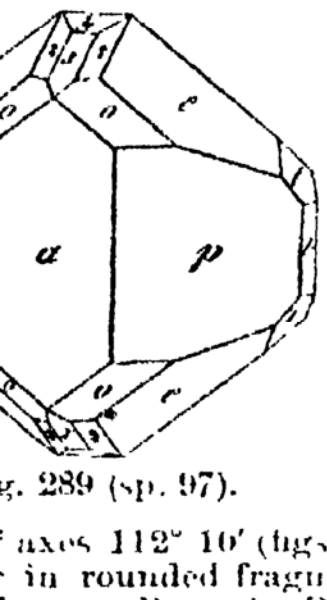
ROOKITE, TiO_2.

prismatic; with polar edges 135° 101° 3′ (fig. 289). Cl. macrodia H. = 5·5 to 6; G. 3·86 to 4·2 rent to opaque; lustre metallic ine. Yellowish, reddish, and hair-brown, streak yellowish white to white. B.B. infusible; with microcosmic salt, a brownish yellow glass. C.c.: titanic acid, with per cent. peroxide of iron. Snowdon and Tremadoc (Wales), Chamouni, Bourg d'Oisans, Mask. *Iserine* is iron-black, and submetallic. thick crystals from Arkansa, U.S.



g. 289 (sp. 97).

98. CASSITERITE, SnO_2.

Pyramidal. P 87° 7′. Pz 67° 50′ (figs. 290 to 292). Crystals ∞P, P, or ∞P (*g*), P (*s*), ∞P∞ (*t*), or with P∞ (*P*), (fig. 290), and also ∞P2 (*x*) and 3P3 (*z*), (fig. 291). Heminrope very common, combined by a face of P∞ with axes 112° 10′ (figs. 293, 171, 172, 173), also fibrous (*Wood* in rounded fragments and grains (*Stream Tin*). Cl. pris- long ∞P, and ∞P∞, imperfect, brittle. H. = 6 to 7,

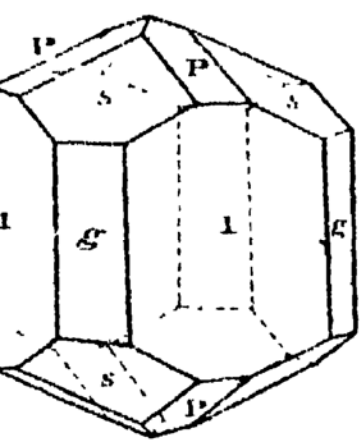


Fig. 290.

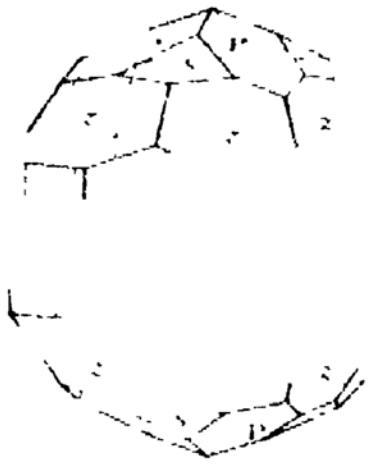

Fig. 291.

to 7. Translucent or opaque; adamantine or resinous. but usually grey, yellow, red, brown, and black; streak light grey, or brown. B.B. in the forceps infusible; on

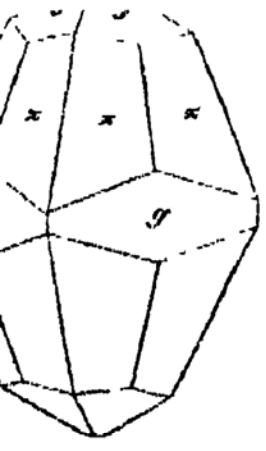

Fig. 292.

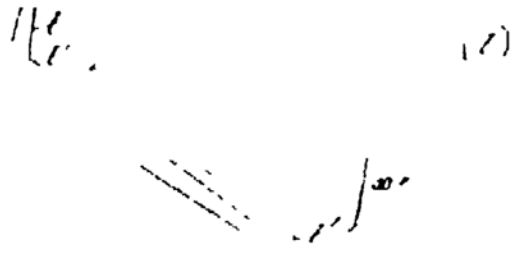

Fig. 293

l, in the inner flame, reduced to tin. Not affected by acids. 8·6 tin and 21·4 oxygen, but often mixed with peroxide of manganese, or tantalic acid. Cornwall, Bohemia, Saxony, lesia, Haute-Vienne in France, Greenland, Russia, North uth America, Malacca, Banca, and Queensland. Almost y ore of tin.

HAUSMANNITE, $2MnO, MnO_2$.

nidal. P 116° 59′; P∞ 98° 32′ (fig. 110). Twins common, ettes of twins (figs. 174, 175). Cl. basal, perfect, less so P and acture uneven. H. = 5·5; G. = 4·7 to 4·8. Opaque; metallic Iron-black; streak brown. B.B. infusible, but becomes brown. Sol. in h. acid, with evolution of chlorine. Powder s. acid red. C.c.: 31 protoxide and 69 peroxide of man Ihlefeld and Ilmenau in the Harz, and Sweden.

100. BRAUNITE, MnO, MnO_2.

Tetragonal. P 108° 39′. Cl. P, brittle. H. = 6 to 6·5; G. 4·9. Metallic lustre. Colour and streak dark brownish C.c.: 70 manganese and 30 oxygen, generally with about 8 p of silica. Ihlefeld and St Marcel. *Marceline* has violet tar

101. PYROLUSITE, MnO_2.

Right prismatic, ∞P 93° 40′, generally radiating fibrous, or rthy. Cl. ∞P, friable. H. = 2 to 2·5; G. = 4·7 to 5. Opaque, lustre silky to semi-metallic. Dark steel-grey to black, streak black. Soils. B.B. infusible, loses oxygen and becomes brown. Sol. in h. acid, with evolution of chlorine. C.c. manganese 63, oxygen 37. Arndilly (Banffshire), Cornwall and Devon. Ilmenau, Ihlefeld, France, Hungary, Brazil. Used for re moving the green iron tint from glass, hence its name and that of *Savon de verre*. Also for obtaining oxygen and chlorine. *Wad* is a variety with 5 per cent. of water, from Warwickshire.

Fig. 294

102. CRONSTEDTITE, $3(FeO, 2MnO, MnO_2)$.

Oblique. H. = 4·5, G. = 5. Metallic. Black, streak Thuringia.

103. PLATTNERITE, PbO_2.

Hexagonal. ∞P 120°. Cl. indistinct, brittle. G. = 9·4. metallic. Iron-black, streak brown. C.c.: lead 86·2, 13·8. Leadhills.

104. MINIUM, $2PbO, PbO_2$.

Pulverulent. H. = 2 to 3; G. = 4·6. Dull. Colour bri streak orange-yellow. B.B. fuses easily and reduced. S acid. C.c.: lead 90·7, oxygen 9·3. Leadhills, Weardale shire, Anglesea, Badenweiler, Siberia.

5. HYDROUS OXIDES.

105. SASSOLINE, BO_3, H_3O.

Anorthic. 0P, ∞P∞ 70° 30′. Scaly in sided plate basal. Flexible and sectile. H. = 1, G. = 1·4 to 1·5. Tran pearly, white, taste bitter; greasy. Sol. in hot water boracic acid 56·45, water 43·55. Hot springs of Sas Siena, Tuscany, and with sulphur in the crater of Lipari Islands.

106. TURGITE, $2Fe_2O_3 \cdot H_2O$.

Massive and fibrous, also earthy. H. = 5 to 6, G. = 3·54 Lustre satin-like, also dull. Colour reddish black to bri Botryoidal surface, fractures like limonite. Opaque. C.c.: iron sesquioxide 94·7, water 5·3. B.B. decrepitates violently and yields water. Korrera (Hebrides), Bogoslovsk (Urals), and many limonite localities. Frequently taken for limonite.

Fig. 295 (si

107. DIASPORE, Al_2O_3, H_2O.

Right prismatic, ∞P 129° 47′, usually thin foliated. Cl. brachydiagonal, perfect, brittle. H. = 6, G. = 3·3 to 3·4. Vitreous, pearly on cleavage planes. Colourless to yellowish, greenish, or violet. B.B. infusible, decrepitates. Insoluble. C.c. alumina 85, water 15. Schemnitz, Brookbo, Switzerland, Naxos, Chester, Chusett. Fig. 295.

108. GOTHITE, Fe_2O_3, H_2O.

Right prismatic, ∞P 94° 55′; also columnar, fibrous, or scaly. Cl. brachydiagonal, perfect; brittle. H. = 5 to 5·5, G. = 3·8 to 4·4. Opaque, or fine crystals transparent, and hyacinth-red; lustre adamantine or silky. Colour yellow, red, or dark brown, streak brownish yellow. B.B. becomes magnetic, difficultly fusible. Sol. in h. acid. C.c.: peroxide of iron 90, water 10. Hoy (Orkney), Achavanisdale (Caithness), Salisbury Crags (Edinburgh), Lostwithiel, Clifton, Bristol, Przibram, Siegen, Saxony, Ural America.

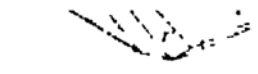

Fig. 296.

ANGANITE, Mn_2O_3, H_2O.

rismatic, sometimes hemihedric; ∞P (*M*) 99·40. Crystals (figs. 298 to 300), vertically striated; mmar or fibrous. Hemitropes com l. brachydiagonal, perfect; brittle. to 4. G. 4·3 to 4·4. Opaque, lustre steel grey to iron black wn. B.B. infusible. Sol. in warm C.c. peroxide of manganese 89·6, Grandholm (Aberdeenshire), pton Pyne (Exeter), Churchhill , Warwickshire, Ilefeld, Thuringia, weden, Nova Scotia.

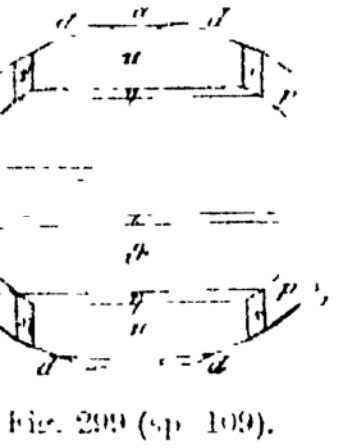

Fig. 299 (sp. 109).

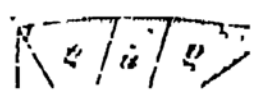

Fig. 300 (sp. 109).

MONITE, $2Fe_2O_3 + 3H_2O$.

. botryoidal, and stalactitic, some- thy. H. 5·5 to 5·5, G. 3·4 to aque; lustre silky, glimmering, or dull. Brown, yellow- blackish brown, often black on surface; streak ochre- In closed tube yields water and becomes red. B.B. in e becomes magnetic, fusing to a glass. C.c. peroxide 5·6, water 14·4. Sandlodge (Shetland), Hoy (Orkney), Bristol, Cornwall, Harz, Thuringia, Nassau, Styria, Carin- tia, United States.

ANTHOSIDERITE, Fe_2O_3, $2H_2O$.

, stellate, also as an ochre. H. = 2·5. Silky or greasy, or earthy. In needles, golden-yellow or brown-red, as yellow, red, or brown; streak ochre-yellow. B.B. like C.c.: peroxide of iron 81·6, water 18·4. Hoy (Orkney), sdale, Kilbride, Wicklow, Ilmenau, Goslar, and Elbingerode iz.

EAUXITE, $(3Al_2O_3, Fe_2O_3)$, $2H_2O$.

concretionary, disseminated; also earthy and clay-like. White, grey, ochre-yellow, brown, and red. C.c.: 50·4, peroxide of iron 26·1, water 23·5. From Beaux or Arles, and elsewhere in France. In grains, in compact Pure varieties used for manufacture of aluminium.

HASITE, $P_2O_3 + 2H_2O$.

hous masses, resin-like. H. 3·5 to 4·5, G. 4 to 5. rown to black; streak wax-yellow to olive-green. C.c.: ent. sesquioxide of uranium, 10 of water, with impurities e near Joachimsthal).

SITE, MgO, H_2O.

ohedral, R 82° 22′; also foliated and botryoidal columnar perfect, ductile, lamina flexible. H. = 2, G. = 2·3 to 2·4 nt, pearly. Colourless. B.B. infusible. Easily soluble in 69 magnesia, 31 water. *Nemalite* is a fibrous variety Swinaness and Quin Gio in Unst, Beresovsk , Hoboken, New Jersey, Texas, Pennsylvania.

, MANGANITE, MnO, H_2O.

d. H. 2·5. Pearly, white, but changing through bronze Reflected by transmitted light. In matrass becomes ssion, bodily black, yielding water. Sol. in h. acid. oxide of manganese 79·8, water 20·2. In veins in mag- Pacher in Tyrol.

BBSITE (*Hydrargillite*), Al_2O_3, $3H_2O$.

onal. C.c. Gibbsia, 34·5 water. The crystals are found in the Urals; stalactites from Richmond in Massachu- Villa Rica in Brazil.

OMITE, Fe_2O_3, $3H_2O$.

e in stalactites, also as a yellow ochre. Like limonite, but astre. C.c.: peroxide of iron 74·8, water 25·2. Leadhills, k (Cornwall), Novgorod Russia.

HYDROTALCITE, Al_2O_3, $3H_2O$ (MgO, H_2O) + $6H_2O$.

onal. Cl. basal, foliated, and somewhat fibrous. H. = 2; . White, pearly. Greasy to the touch. Translucent. mina 16·8, magnesia 39·2, water 44. Zlatoust, Urals; Norway; New York.

119. PYROAURITE, Fe_2O_3, $3H_2O$ + 6MgO, H_2O + $6H_2O$.

Hexagonal; tables and scaly coatings. Lustre pearly to submetallic. Colour white to gold-yellow. Translucent. B.B. infusible, yields water. Sol. in h. acid. C.c.: peroxide of iron 23·9, magnesia 35·8, water 40·3. Haaf Grunay in Shetland, Långban in Wermland.

120. GUMMITE, U_2O_3, $3H_2O$.

In rounded lumps, resembling gum. H. = 2·5 to 3; G. = 3·9 to 4·2. Lustre greasy. Reddish yellow to yellowish brown. C.c.: 72 per cent. sesquioxide of uranium, water 14·75, with impurities. Johann-Georgenstadt.

121. PSILOMELANE, (BaO, MnO) $MnO_2 + 3H_2O$, $MnO_2 + 3H_2O$.

Massive and botryoidal; fracture conchoidal. H. = 5·5 to 6; G. = 4·1 to 4·3. Bluish black. B.B. infusible. About 80 per cent. of oxide of manganese, with baryta, potash, and water. Hoy (Orkney), Leadhills, Cornwall, Devon, Schneeberg, Ilmenau, Vermont in France. *Wad* is similar, but sometimes soft and light. Leadhills, Cornwall, Harz, France.

122. CHALCOPHANITE, $MnOZnO + 2MnO_2 + 2H_2O$.

Hexagonal. R R 114° 30′. Cl. basal. H. = 2·5; G. = 3·91. Metallic lustre. Blue black; streak brown, dull. Opaque; flexible. C.c.: manganese binoxide 59·94, protoxide 6·6, zinc oxide 21·7, water 11·6. Sterling Hill (New Jersey).

OXIDES OF NON-METALS.

I. OXIDES OF ARSENIC-ANTIMONY FAMILY (TEROXIDES).

123. ARSENOLITE, AsO_3.

Cubic, in octahedra also botryoidal, stalactitic. H. = 1·5; G. = 3·7. Lustre vitreous. White, streak pale yellow. Translucent. Sublimes in closed tube, condensing in brilliant octahedra. C.c.: arsenic 75·76, oxygen 24·24. Cornwall, Andreasberg, Joachimsthal, Kapnik (Hungary), Nevada, California.

124. SENARMONTITE, Sb_2O_3.

Cubic; in octahedrons. Cl. octahedral, also massive granular. H. = 2 to 2·5, G. = 5·22 to 5·3. Transparent; adamantine. White or grey. B.B. in inner flame fuses and colours the flame greenish blue. Sol. in h. acid. C.c.: antimony 83·56, oxygen 16·44. Endellion in Cornwall, Constantine in Algeria, Malaczka in Hungary.

125. VALENTINITE, Sb_2O_3.

Right prismatic. ∞P 137°. Cl. ∞P, perfect. H. = 2·5 to 3; G. = 5·5 to 5·6. Translucent; adamantine to pearly. Yellowish white, brown-grey, streak white. Other properties and composition like senarmontite. Glendinning (Dumfriesshire), Przibram, Bräunsdorf (Saxony), Harz, Hungary, Allemont (Dauphiné), Siberia.

126. BISMITE, Bi_2O_4.

Massive, earthy. G. 4·36. Grey, yellow, green. C.c.: bismuth 89·65, oxygen 10·35. St Agnes (Cornwall), Schneeberg, Siberia.

127. MOLYBDITE, MoO_3.

Right prismatic, ∞P 136° 48′. In capillary crystals, also powdery. H. = 1 to 2; G. = 4·5. Straw-yellow to yellowish white. C.c.: molybdenum 65·71, oxygen 34·29. With molybdenite at many of its localities.

128. TUNGSTITE, WO_3.

Earthy. Soft yellow or yellowish green. Sol. in alkalies. C.c.: tungsten 79·3, oxygen 20·7. Cumberland and Cornwall, Monroe in Connecticut.

129. CERVANTITE, $Sb_2O_3 + Sb_2O_5$.

Right prismatic. Acicular, generally earthy. H. = 4 to 5; G. = 4·1. Isabel-yellow, reddish white. B.B. on charcoal reduced; unaltered *per se*. Sol. in h. acid. Harehill, Ayrshire; Endellion, &c., Cornwall; Cervantes, Spain; Felsobanya, Hungary; Mexico, Canada; California.

130. STIBICONITE, Sb_2O_4, H_2O.

Massive, powdery. H. = 4 to 5·5; G. = 5·28. Pale yellow. In closed tube yields water. C.c.: antimony 74·9, oxygen 19·6, water 5·5. Goldkronach (Bavaria).

131. VOLGERITE, Sb_2O_5, $5H_2O$.

Massive and powdery. White. In tube yields water, below redness. C.c.: antimony 58·9, oxygen 19·3, water 21·8. Constantine in Algeria.

132. ZINKENITE (*Tinder Ore*).

In soft, flexible, tinder-like masses. Colour dark cherry-red to blackish red; lustre glimmering. Two varieties:—one, from Klausthal, contains antimony oxide 38, iron oxide 40, lead 16, sulphur 4; the other, from Andreasberg and Klausthal, seems to be a mixture of jamesonite (82·04 per cent.), mispickel (13·46), and pyrargyrite (4·34).

133. TELLURITE.

Yellowish or whitish. Radiated, spherical masses. Gives the reactions of tellurous acid. Facsebaya and Zalathna, Colorado.

4. TANTALIC OCHRE.
wdery; brown; vitreous. Pennikoja in Finland.

2. OXIDES OF CARBON-SILICON FAMILY (BINOXIDES).

5. QUARTZ, SiO_2.
exagonal; the purest varieties tetartohedral. The primary
mid P has the middle edge = 103° 34′, and the polar edges =

and −R; the latter
often wanting. Many faces plagihedral, as
gs. 302, 306, 309.

vins common, with parallel axes, and other
ly in juxtaposition (see fig. 178) or interpene-
ng. Crystals often distorted, as in figs. 310
13. The crystals occur either single, attached,
mbedded, or in groups and druses. Most fre-
tly granular, massive, fibrous, or columnar;
in pseudomorphs, petrifactions, and other
s. Cl. rhombohedral along R, very imper-
prismatic along ∞P, still more imperfect.
ure conchoidal, uneven, or splintery. H. 7;
2·5 to 2·8; 2·65 in the purest varieties
urless, but more often white, grey, yellow,
n, red, blue, green, or even black. Lustre
eous, inclining to resinous; transparent or
slucent; when impure almost opaque. B.B.
ible alone; with soda effervesces, and melt

5 silicon and 51·95 oxygen; but frequently a small amount of
oxides of iron or titanium, of lime, alumina, and other
tances.

he following are varieties:—

ock-crystal: highly transparent and colourless; Dauphine,
zerland, Tyrol, Hungary, Madagascar, and Ceylon.

methyst: violet-blue (from iron peroxide or manganese), and
n marked by zigzag or undulating lines, and the colour dis-
d in clouds; Siberia, Persia, India, Ceylon, Brazil (white or
ow, named false topaz), Hungary, Ireland (near Cork), and
rdeenshire. Wine-yellow (*Citrin* and *Gold Topaz*): the brown
Smoky Quartz (coloured by a substance containing carbon
nitrogen); and the black or *Morion*, from Siberia, Bohemia,
nsylvania, and other places. *Cairngorm Stone*, black, brown, or
ow, from Aberdeenshire mountains. The above are valued as
mental stones; those which follow are less so.

se Quartz: red inclining to violet blue; Clashmaree Hill (Aber-
), and Rabenstein in Bavaria. *Milk Quartz*: milk-white, and
tly opalescent; Greenland. *Prase*: leek and other shades of
green; Saxony and Cedar Mountain in South Africa. (
inclosing asbestos: greenish white or grey, olive green, red
or yellow; Ceylon and Malabar. *Aventurine*, enclosin
yellow, red, green, or brown; India, Spain, and Scotland.
indigo or Berlin blue; Golling in Salzburg.

Common Quartz, crystallized or massive, white or gray,
brown, &c., is a frequent constituent in many rocks. Som
varieties are properly rocks, as

(1) *Ferruginous Quartz*, or *Iron Flint*: red, yellow, or
often associated with iron ores.

(2) *Jasper*: red, yellow, brown, also green, grey, wh
black: alone, or in spots, veins, and bands (*Ribbon* or
Jasper), Urals, Tuscan Apennines, Harz, and many parts of S

(3) *Lydian Stone*, or *Flinty Slate*: black, grey, or whit
splintery or conchoidal fracture, breaks into irregular fr
and passes by many transitions into clay slate, of which it
merely an altered portion, as in Scotland, used as a touch
gold, and at Eldal (Sweden) manufactured into ornaments

(4) *Hornstone* or *Chert*: compact, conchoidal, splintery
translucent on the edges; dirty grey, red, yellow, green, o
passes into flinty slate or common quartz; common in the M
limestone, Oolite, and Greensand formations; and often
petrifactions, as shells, corals, and wood.

Other siliceous minerals seem intimate mixtures of qu
opal, as —

Flint: greyish white, grey, or greyish black, also yell
or brown, sometimes in clouds, spots, or stripes, se
parent; lustre dull; fracture flat conchoidal, occurs chiefl
Chalk formation, as in England, Ireland, Aberdeenshire,
Germany, and other countries; sometimes in beds or vertic
often in irregular lumps or concretions, inclosing petrifac
sponges, echinoids, shells, or siliceous *Infusoria*. The
partly derived from carbon, or organic matter. Used for
gun flints, and still for the manufacture of glass and pott
cut into cameos or other ornaments.

Chalcedony: semitransparent or translucent; white, gr
green, yellow, or brown, stalactitic, reniform, or botryo
in pseudomorphs or petrifactions; Iceland, Faroes, Trev
Cornwall, Scotland, Hungary, Bohemia, Oberstein. *C*
chiefly blood-red, but also yellow, brown, or almost black
Arabia, Surinam, and Siberia; also Bohemia, Saxony, and
(Fifeshire). *Plasma*: leek or grass-green, and waxy lustr
pus, Black Forest, India, and China.

Chrysoprase: apple green; Silesia, and Vermont in North
Moss-Agate and *Heliotrope*: dark green and dendritic calle
stone when sprinkled with deep red spots), India, Siberia,
Fassa Valley, island of Rum and other parts of Scotland.

136. TRIDYMITE, SiO_2.

Hexagonal; P middle edge 121° 4′, polar edges 127° 35′
crystals very minute hexagonal tables of 0P, ∞P but
edges replaced by P and ∞P2, are rare (fig. 314). Mo

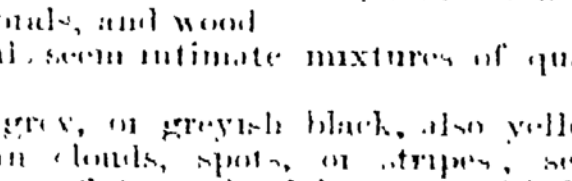

Fig. 314.

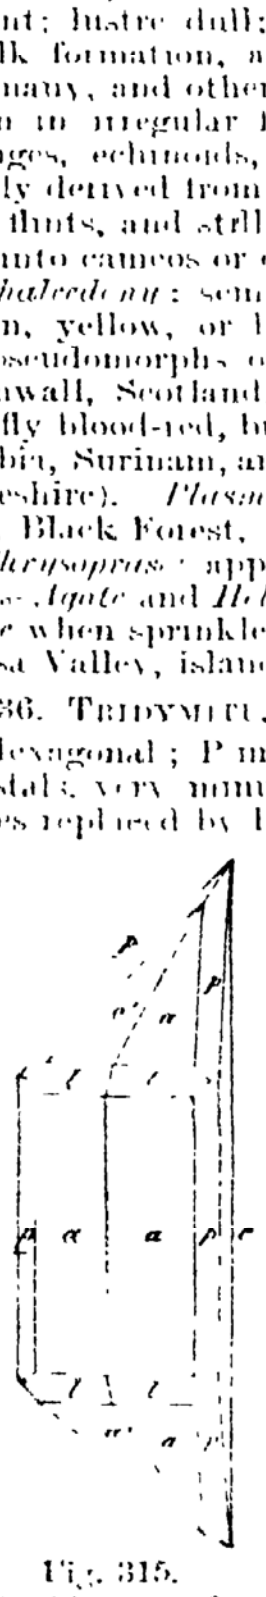

Fig. 315.

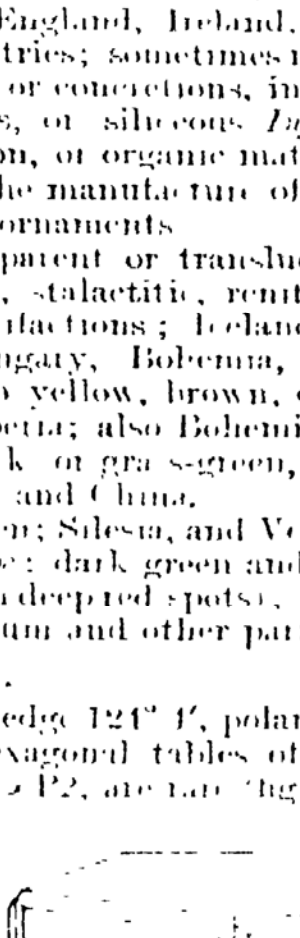

Fig. 316.

in double or (oftener) triple combinations (figs.
315 to 317). Cl. basal, indistinct; fracture con-
choidal. H. 7; G. = 2·282 to 2·326. Colourless
and transparent, vitreous, pearly on the base.
B.B. like quartz. C.C.: 96 silica, with some
alumina, magnesia, and iron peroxide, probably from the
Discovered by Von Rath in the trachyte of San Cristob
Pachuca, in Mexico; also in the trachyte of Mont-Dore
Dome), the Drachenfels, and Hungary. Many opals, trea
solution of potash, leave crystals, as those from Zimapan,
Silesia, and the cacholong from Iceland. Where such
are abundant, the opal becomes opaque or snow white
regards these as still another variety of silica.

Opal, $9SiO_2$, H_2O to $3SiO_2$, H_2O.

phous; fracture conchoidal, very brittle. H. 5·5 to 2 to 2·2. Transparent to opaque vitreous inclining to . Colourless, but often white, yellow, red, brown, green, with a beautiful play of colours. B.B. decrepitates and opaque, but infusible, in the closed tube yield water; wholly soluble in solution of potash. Gives silica with 5 to cent water. Most opals are mixtures of various mineral. ollowing may be noticed: (1) *Hyalite, Glassy Opal*, in parent colours, very transparent, small botryoidal Kaiserstuhl in the Brisgau, Schemnitz, Silesia, Mexico, and other places. (2) *Opal-agate* or *Girasol*, vitreous, in the bright by smith red or yellow, Mexico, and the Faroe Isles. (3) *Noble Opal*, semi-transparent, milky, inclining to vitreous, blue, green, or yellow, with brilliant prismatic colours; must show double or and on breaking or moving specimen. Specific gravity varies (1·9 to 2·3). (4) *Common Opal*, semi-transparent, vitreous, yellow, green, red, or brown, Hungary, Faroes, Iceland, Cape Clear, west coast of Scotland, &c. (5) *Hydrophane*, or *Oculus mundi*, when dry, adheres to the tongue, and becomes translucent when immersed in water, Hungary, Faroes, Iceland, Cape Clear, west coast of Scotland, &c. (6) *Wood opal*, or *Xylopal*, or *Lithoxylon*, with the structure of wood distinctly seen, Hungary, Bohemia, Faroes, Iceland, &c. (7) *Hyalite*, colourless, transparent, botryoidal, or stalactitic, Montbrisontant, near Paris, &c. (8) *Opal-jasper*, yellow, red, or brown, opaque, dull. (9) *Cachalong*, opaque, dull, glimmering, yellowish or greyish-white, translucent on the edges, Faroes, Iceland, the Grand Canary, &c. (10) *Menilite*, brown, slightly translucent, Menilmontant, near Paris, &c. (11) *Opal-basalt*, yellow, red, or brown, opaque, dull. (12) *Cachalong*, opaque, dull, glimmering, yellowish or greyish-white, translucent on the edges, Faroes, Iceland, the Grand Canary, &c. (13) *Siliceous sinter*, from hot springs, &c.

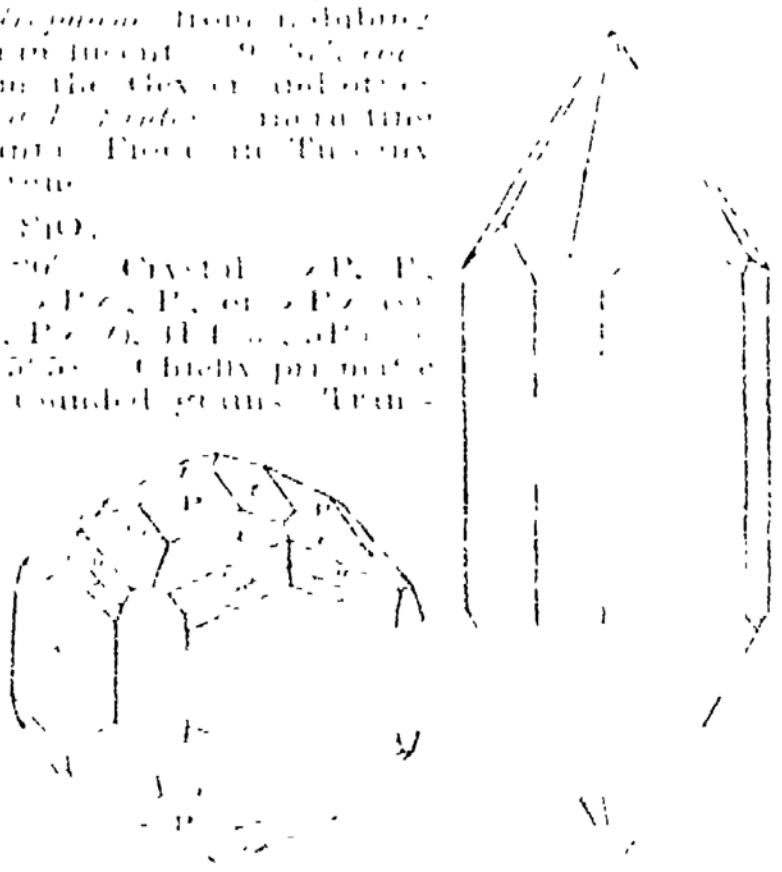

Fig. 320.

Fig. 321 (p. 13).

Meek, Arendal, Sweden, Bohemia, St. Stephens, Corinthia, Tyrol, Ceylon, and North America. Pseudomorphs in Harris (fig. 319), Lewis (*Hunterite*). Sutherland (the cocoanut-variety), are sold for diamonds. The more highly coloured are named hydrophanes, and are valuable gems.

Chromates, Selenides, Tellurides, &c.

Crocoite, $PbCrO_4$.

Prismatic dominant, figs. 320 to 323, also 67 to 77, and basal; cleavage prismatic, or striæ produced by oscillation with face of the cube, visible. Often distorted, Cleavage prismatic, difficult, brittle. H. 6

Fig. 322

G. 4·9 to 5·9. Red to yellow, often somewhat cochineal-streak brownish-red. Gives off on broken coals smell of In closed tube sulphur sublimes. B.B. on charcoal with blue flame, and odour of sulphurous acid. In mixture to magnetic bead. Soluble in acid with deposition of Ore from 16·7, sulphur 5·3, often contains gold in visible when broken. Common in veins of silver ores. Tarnowitz,

Birnam, Scotland; Cornwall, England, Elba and Traversella Rossie, Middletown, and Schoharie in U.S. Auriferous Berezoff (Siberia), Adelfors (Sweden), Mexico. Used to be facets and set as an ornament, under the name of marcasites; also for striking fire in the old firelocks, whence the name of firestone; now used for manufacture of sulphuric acid.

Fig. 323 (sp. 139).

140. Marcasite, FeS_2.

Right prismatic; ∞P 106 5′. Cry tals tabular, thin prismatic, or pyramidal. Twins very frequent, cockscomb-like groups, or and stalactitic. Cl. $\infty P\infty$ fracture uneven, brittle. H. to 6·9. Greenish bronze yellow to greenish grey, often with brown crust, streak greenish grey or brownish black. B.B., &c., like pyrite. Very prone to decomposition being changed into green vitriol, which may be detected by the tongue. *Spear Pyrites* are twin like fig. 325; Lattimer, Pulsnitz, *Hepatic Pyrites* or *Leberkies*, brown, generally decomposing, Harz, Saxony, Sweden. *Cockscomb Pyrites*, Derbyshire and the Harz. *Kyrosite* contains arsenic.

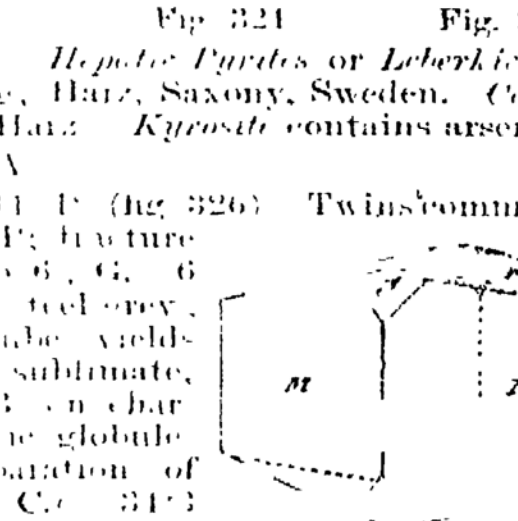

Fig. 324

Fig.

Hepatic Pyrites or *Leberkies*

141. Mispickel, FeS_2 + $FeAs_2$.

Right prismatic; ∞P 111° 5′ (fig. 326). Twins common massive or columnar. Cl. $\infty P\infty$; fracture uneven, brittle. H. 5·5 to 6, G. 6 to 6·2. Silver white to steel-grey, streak black. In closed tube yields but a red then a brown sublimate, leaden metallic appearance. B.B. on charcoal fuses to a black magnetic globule. Sol. in nitric acid with separation of arsenious acid and sulphur. Ore 34·3 iron, 46·1 arsenic, 19·6 sulphur, sometimes silver or gold, or 2 to 9 of cobalt. Cornwall, Freiberg, Zimmwald, Sweden, Franconia, America.

Fig. 326.

142. Leucopyrite, $FeAs_2$.

Right rhombic; ∞P 132° 26′; $P\infty$ (o) 51° 20′. Crystals massive or columnar. Cl. basal; fracture uneven. H. = 5 to 5·5; G. = 7 to 7·4. Silver white with darker tarnish; streak greyish black. B.B. emits strong smell of arsenic, and fuses to a black magnetic globule. Ore: iron 27·2, arsenic 72·8; sometimes iron 32·2 and arsenic 66·8; always some sulphur, and often nickel and cobalt. Found in Norway, Andreasberg, Styria, and Silesia. *Smaltzopyrite*, from Bieber in Hesse, seems a variety.

143. Cobaltine, CoS + $CoAs$.

Cubic and hemihedral, sometimes massive (figs. 67, 7 octahedral perfect. Brittle. H. = 5·5. G. = 6 to 6·3. Brilliant Pinkish silver-white, tarnishes yellow or grey; streak black. B.B. with borax blue glass, evolves smell of arsenic cobalt 35·0, arsenic 44·9, sulphur 19·2. St. Just in Cornwall, Tunaberg in Sweden, Skutterud in Norway, Querbach in Si

144. Glaucodot, $(Co, Fe)S_2$ + $(Co, Fe)As_2$.

Right prismatic; ∞P 111° 36′. Cl. basal, perfect. H. = 6. Lustre metallic. Greyish white; streak black. C.c. 24·7, iron 11·9, arsenic 47·2, sulphur 20·2. Huasco in Chi

145. Smaltine, $(Co, Fe, Ni)As_2$.

Cubic, generally like fig. 27; also reticulated and granu pact. Cl. octahedral; fracture uneven; brittle. H. = 5· tin-white to steel-grey, with dark or iridescent streak greyish black. Evolves odour of arsenic, when h heated. Ore 7·1 arsenic, 28·6 cobalt; sometimes 3 to and 1 to 2 nickel, or 4 bismuth. Dolcoath and Red Cornwall, Schneeberg, Annaberg, Tunaberg, Allemont, C in Connecticut.

146. Chloanthite (*White Nickel*), $NiAs_2$.

Cubic, generally fine granular or compact; fracture brittle. H. = 5·5; G. = 6·4 to 6·6. Tin-white, rapidly ta black. In the closed tube yields a sublimate of arse becomes copper red. Gives odour of arsenic when broke fuses with much smoke, becomes coated with crystals of a acid, and leaves a brittle grain of metal. C.c.: 28·2 nic arsenic, but often with cobalt. Schneeberg, Riechelsdo mont, Chatham in Connecticut.

ERSDORFFITE, $NiS_2 + NiAs_2$.

(figs. 74, 30, 26). Cl. cubic, generally granular. H. = 5·5, f. Lustre metallic. Silver-white to steel-grey, decrepitates tube. B.B. fuses to a black slag; partially sol. in h. acid. ·2 nickel, 45·1 arsenic, and 19·4 sulphur; sometimes balt. Craignuit, near Loch Fyne, with 23 nickel and 6 The Harz, Sweden, Spain, and Brazil.

ILLMANNITE, $NiSb + NiS_2$.

(figs 31, 29, 27); often tetrahedral, and in twins as in , 329. Cl. cubic, perfect; fracture uneven. H. = 5 to 5·5 to 6·5. Lead-grey to tin-white, often with nide cent

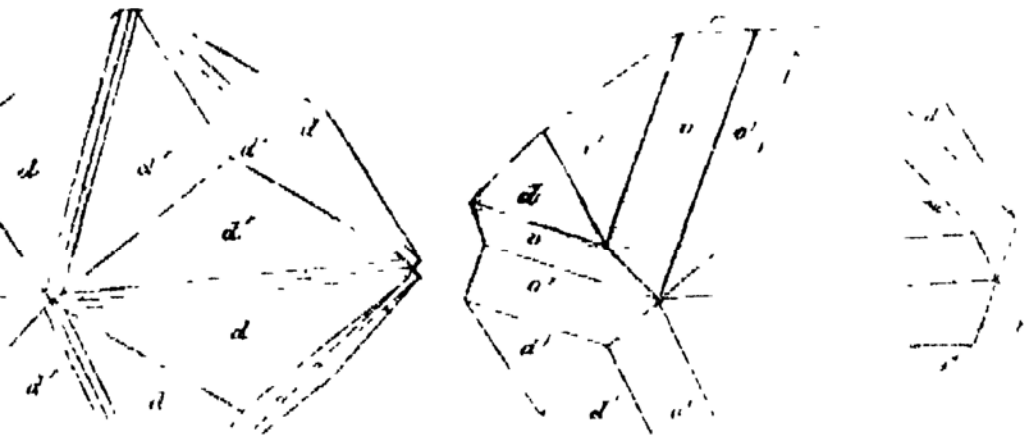

Fig. 328

Fig. 329

B.B. fuses with dense fumes. Sol. in n. acid. C. 57·5 antimony, and 15·1 sulphur. Westerwald, Siegen, ode, Lolling (Curinthia, Lobenstein and Bleiberg.

AMMELSBERGITE, $NiAs_2$.

prismatic; ∞P 123° to 124. Chiefly massive or in botryoidal aggregates. H. 5; G. 7·2. Colour tin-white erg Reichelsdorf, and Wittichen in Baden.

AUERITE, MnS_2

(figs. 30, 30 26, 30 33 37). Crystals simple or in spherical Cl. cubic, perfect; H. = 4; G. 3 to. Reddish brown to h black; streak brownish red. In closed tube yields sul- d leaves a green mass, which is sol. in h. acid. C. = 46 se and 54 sulphur. Kalinka in Hungary.

YRRHOTITE (*Magnetic Pyrites*), Fe_7S_8

onal, P 126 48'. Crystals rare, sometime hemihedral on ; ly massive or granular. Cl. ∞P, imperfect, brittle. H. 5; G. = 4·5 to 4·6. Colour bronze-yellow with purplish rnish; streak greyish black. More or less magnetic. C.c.:

Fig. 330

Fig. 331

n and 36·35 sulphur; sometimes with nickel. Common in limestones and diorites of Scotland. Crystallized in above Askaig on Loch Shin, Sutherland, Carnarvon, Cornwall Bodenmais, Andreasberg. Distinguished by its colour solubility in h. acid.

INNÆITE, $2(Co, Cu)S + CoS_2$.

(figs. 29, 30); often twinned; twin face O also massive. e; brittle. H. = 5·5; G. = 4·9 to 5. Silver-white, with a arnish; streak blackish grey. B.B. fuses to a grey mag- obule, which is bronze-yellow when broken. C.c., cobalt pper 14·4, iron 3·5, sulphur 38·5. Bastnaes (Sweden).

IEGENITE, $CoS + Ni_2S_3$ (?)

; generally in crystals like fig. 29; also massive. Colour hite, inclining to pink. Other features like linnæite. C.c. 0·8, nickel 14·6, sulphur 43·1. Musen near Siegen, Mary- d Missouri. The American mineral has 30·5 of nickel.

POLYDYMITE, Ni_4S_5.

; in minute octahedral crystals and flattened twins. Cl. H. = 4·5; G. = 4·8). C.c.: 39·45 nickel, 40·55 sulphur, but y with 4 of iron. Westphalia. *Saynite* or *grunauite* seems bismuthic and cobaltic variety; it is from Grunau in Sayn- rchen.

155. BYRICHRITE, $3NiS + 2NiS_2$.

H. = 3 to 3·5; G. = 4·7. C.c.: 54·23 ckel, 2·79 ir sulphur. From the Westerwald.

156. HORBACHITE, $4Fe_2S_3 + Ni_2S_3$.

Crystalline masses. H. 4·5; G. 4·43 to 4·7. Colour beck-brown; streak black. C.c., nickel 11·98, iron 41·96, 15·87. Horbach in the Black Forest.

157. SKUTTERUDITE, $CoAs_3$

Cubic (figs. 30, 26 with 33, 40) and granular. Cl. cubic ture conchoidal, brittle. H. 6; G. 6·4 to 6·84. Tin lead grey. Lustre brilliant. In closed tube gives sublim metallic arsenic, otherwise like smaltine. C.c. 79 arse cobalt. Skutterud, near Modum in Norway.

158. GALENA, PbS.

Cubic, crystals chiefly cube, octahedron, and rhombic hedron; rarely 20 and 202. Also massive and granular, or lamellar, and in pseudomorphs of pyromorphite and mimetals. Cl. cubic, very perfect, fracture scarcely observable, sectile. H. 2·5, G. 7·2 to 7·6. Lead grey, with darker or more or less iridescent tarnish, streak grey to black. B.B. decrepitates, fuses, and leaves a globule of lead. Sol. in n. acid. C.c. 86·7 lead, and 13·3 sulphur, but usually contains a little silver, ranging from 1 to 3 or 5 parts in 10,000, rarely 1 per cent. or more. Some contain copper, zinc, or antimony, others selenium, and others (the "supersulphurets") probably free sulphur (2 to 8 per cent.). Most common ore of lead in many countries. Leadhills, Pentland Lanarkshire, Inverkeithing, Monaltrie, Tyndrum, Strontian Orkney, Cornwall, Derbyshire (Castleton), Cumberland Moor), Durham (Allenheads), Wales, Isle of Man.

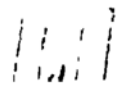

Fig.

159. CUPROPLUMBITE, $2PbS + Cu_2S$.

Cubic. H. 2·5; G. 6·4. Bluish grey. Cuba.

160. BLEIGLANCE, $6PbS + Bi_2S_3$.

Cubic. G. 7·07. Cl. cubic. Lead to dark grey. Lustre C.c., sulphur 15, bismuth 20·6, lead 64·2 with copper 1·7 (Park county, Colorado).

161. CLAUSTHALITE, $PbSe$.

Cubic; but massive granular. H. = 2·5 to 3; G. = 8·2 Lead grey, streak grey. B.B. fuses, smells of selenium, the flame blue, stains the support red, yellow, and wh volatilizes, except a small residue, without fusing. C.c. 7 27·3 selenium, but sometimes 11 % of silver. Zorge, Lerb Clausthal in the Harz. *Tilkerodite* and *Selen-Cobalt Blei*, co 3 per cent. of cobalt, from Tilkerode, are a variety.

162. ZORGITE.

Massive granular, like clausthalite but inclining to red often tarnished. There are four varieties: (*a*) *Selen Le* G. 7·4 to 7·5, 5PbSe + CuSe; with 1 copper, 65 lead, 34 se (*b*) The same, but with G. 5·6; 4Pb, 1Cu, 7Se; with 1·5 48·1 lead, and 35 selenium. (*c*) *Selen Kupfer Bl* with 2PbSe + CuSe, with 8 copper, 57 lead and 32 selenium. (*d*) 90 CuSe, with 46·64 copper, 10·58 lead, and 36·59 selenium. Tilkerode and Zorge in the Harz, and near Gadebusch in Thurin

163. ALTAITE, $PbTe$.

Cubic and granular, fracture uneven, sectile. H. = 3 to 3 8·1 to 8·2. Tin white to yellow, with yellow tarnish. B.B. the flame blue, tinging to a globule, which almost wholly vo C.c. 61·9 lead and 38·1 tellurium. Zavodinski in th California, Colorado and Utah.

164. RUBELLITE (*Ruby Copper*), Cu_2S

Right prismatic. ∞P (*o*) 119° 35', $P\infty$ (*l*) middle edge $\frac{1}{2}P$ (*a*) middle edge 65° 10', $2P\infty$ (*d*) middle edge 125° 40', middle edge 65° 48'. Crystals $0P$ (*s*), ∞P (*o*), $\frac{1}{2}P\infty$ (*p*) (

Sb.

prismatic; P with polar
32° 42′ and 92°; ∞P 120°
gs. 335, 336). Crystals short prismatic, or thick tabular,

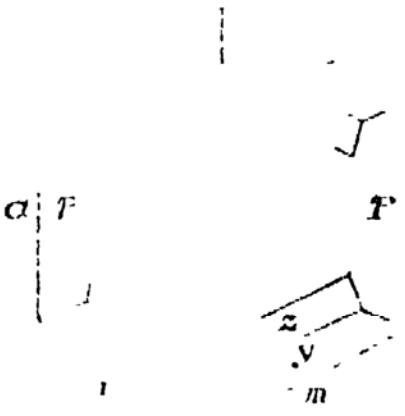

Fig. 335 (p. 176).

and vertically striated (fig. 335); twins united by a face of ∞P; often in stellar groups (fig. 336); also massive or granular. Cl. basal and $P\infty$, distinct; ∞P imperfect; rather brittle, and slightly malleable. H. = 3·5; G. = 9·4 to 9·8. Silver-white to tin-white, with a yellow or blackish tarnish. B.B. fuses easily, fumes staining the charcoal white, and leaves a grain of silver. Sol. in n. acid. C.c.: 64 to 84 silver, and 36 to 16 antimony. Andreasberg, Allemont in Dauphiné, Spain, and Arqueras in Coquimbo (Chili). A valuable ore of silver. A variety from Chili contains 91·2 silver and 5·8 antimony, and is $Ag_{16}Sb$.

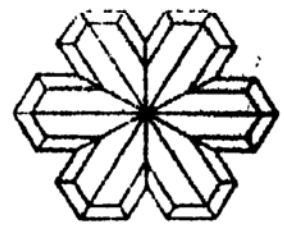

Fig. 336.

177 BLENDE, ZnS.

Cubic and tetrahedral (figs. 152, 153, 337). Twins remarkably common, united by a face of O, and several times repeated; frequently massive and granular. Cl. ∞O, perfect; very brittle. H. = 3·5 to 4; G. = 3·9 to 4·2. Semitransparent to opaque; adamantine and resinous. Brown or black, also red, yellow, and green, rarely colourless or white. B.B. decrepitates, often violently, but only fuses on very thin edges. Sol. in con. n. acid, leaving sulphur. C.c.: 67 zinc and 33 sulphur; but generally in the darker varieties with 1 to 15 iron, 0 to 3 cadmium. Very abundant. Glen Gairn (bright yellow and highly phosphorescent), Leadhills, Tyndrum, Cornwall, Derbyshire, Cumberland, the Harz, Freiberg, Przibram, Schemnitz, Kapnik, North America, Peru. Used for producing zinc vitriol and sulphur, and as an ore of zinc. Lithium, indium, thallium, and gallium have all been found in blende.

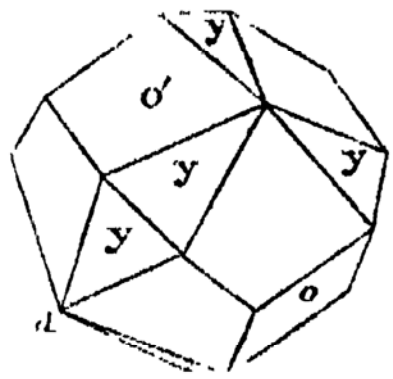

Fig. 337.

178. WURTZITE, $6ZnS + FeS$.

Hexagonal; ∞P, P, with well-marked horizontal striæ. Cl. basal, and prismatic. H. = 3·5 to 4; G. = 3·9 to 4·1. Brownish black; streak light brown. C.c.: like blende, which is thus dimorphous. Oruro in Bolivia, and Przibram (radiated and cadmiferous).

179. GREENOCKITE, CdS.

Hexagonal, and generally hemimorphic. P 86° 21′; 2P 123° 54′. Crystals 2P, 0P, ∞P, P, or P, 2P, ∞P; attached singly. Cl. ∞P, imperfect; basal perfect. H. = 3 to 3·5; G. = 4·8 to 4·9. Translucent; brilliant resinous, or adamantine. Honey- or orange yellow, rarely brown; streak yellow. B.B. decrepitates, and becomes carmine-red, but again yellow when cold; fused with soda forms a reddish brown coating on charcoal. Sol. in h. acid. C.c.: 77·6 cadmium, and 22·4 sulphur. Bishopton in Renfrewshire, Przibram, and Friedensville in Pennsylvania.

Fig. 338.

180 ALABANDINE, MnS.

Cubic; O and $\infty O\infty$, usually massive and granular. Cl. hexahedral, perfect; fracture uneven; rather brittle. H. = 3·5 to 4; G. = 3·9 to 4. Opaque; semi-metallic. Iron-black to dark steel-grey, brownish black tarnish; streak dark green. B.B. fuses on thin edges to a brown slag. Sol. in h. acid. C.c.: 63 manganese and 37 sulphur. Nagyag, Kapnik, Alabanda in Caria, Mexico, and Brazil.

181. MILLERITE, NiS.

Hexagonal rhombohedral; R 144° 8′; in fine acicular prisms of $\infty R2$, R. Brittle. H. = 3·5; G. = 4·6 (or 5·26 to 5·65). Brass- or bronze-yellow, with a grey or iridescent tarnish. B.B. fuses easily to a blackish metallic globule, which boils and sputters. In nitro hydrochloric acid forms a green solution. C.c.: 64·4 nickel and 35·6 sulphur. Morven (Argyllshire), Chapel (Fife), Ayrshire, near St Austell in Cornwall, at Merthyr-Tydvil, Johann-Georgenstadt, Joachimsthal, Przibram, Camsdorf, Riechelsdorf, Pennsylvania.

182. PENTLANDITE (*Eisennickelkies*), $2FeS + NiS$.

Cubic, massive and granular; fracture uneven; brittle. H. = 3·5 to 4; G. = 4·6. Light pinchbeck-brown, with darker streak. Not magnetic. B.B. acts in general like pyrrhotite; the roasted powder forms with borax in the red. flame a black opaque glass. C.c.: 36 sulphur, 42 iron, and 22 nickel; but mixed with pyrrhotite and chalcopyrite. Lillehammer in southern Norway. *Inverarite*, $5FeS + NiS$, with 11 of nickel, from near Inveraray, is a variety.

183 NICKELITE (*Copper Nickel*), $NiAs$.

Hexagonal; P 86° 50′. Crystals ∞P, 0P; rare. Arborescent, reniform, and massive; fracture conchoidal and uneven; brittle. H. = 5·5; G. = 7·5 to 7·7. Light copper-red, with a blackish tarnish. It forms no sublimate in the closed tube. B.B. fuses with strong

to a white, brittle, metallic globule. C.c.: 43·6 nickel and rsenic. Hilderston in Linlithgow, Pibble in Kirkcudbright, ills, Pengelly and Huel Chance in Cornwall, Freiberg, Schnee- Joachimsthal, Sangerhausen, Andreasberg, Chatham in Con- ut. Used as an ore of nickel.

Breithauptite (*Antimonial Nickel*), NiSb.

agonal; P 86° 56′. Crystals, thin striated hexagonal tables ∞P. H. = 5; G. = 7·5 to 7·6. Brilliant. Light copper red, lly with violet tarnish. B.B. fumes, but fuses with great lty. C.c.: 32·2 nickel and 67·8 antimony. Andreasberg.

Stannite (*Tin Pyrites*), $2CuS, SnS_2 + 2(FeS, ZnS) + SnS_2$ ic; in cubes very rare, generally massive and granular. Cl edral, imperfect; fracture uneven or small conchoidal, . H. = 4; G. = 4·3 to 4·5. Steel-grey; streak black. C.c.: 32 tin, 24 to 30 copper, 5 to 12 iron, 2 to 10 zinc, and 30 ur. Huel Rock near St Agnes, St Michael's Mount, and Carn- Cornwall; Zinnwald. Bell metal ore.

Sternbergite, $(AgS + 2FeS) + FeS_3$.

ht prismatic; P middle edge 118°. Crystals usually thin r; in twins, or in fan-like and spheroidal groups. Cl basal, t; sectile, and flexible in thin e. H. = 1 to 1·5; G. = 4·2 to Dark pinchbeck-brown, often et-blue tarnish; streak black. 31·2 silver, 35·4 iron, and 30·4 ur. Joachimsthal, Schneeberg, ohann-Georgenstadt. *Flexible* *ver of Silver*, from Hungary and Freiberg, is identical. *Fre-* $Ag_2Fe_6S_8$, in twins (fig. 339), is a variety.

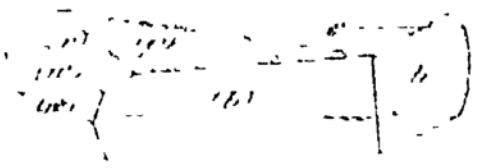

Fig.

Rittingerite, Ag_3As.

ique prismatic. ∞P 126° 18′. P ∞ inclined to 0P. Cl. basal; re conchoidal; brittle. H. = 2·5 to 3 G. = 6·33. C.c.: silver he remainder being arsenic, with some mum. Joachimsthal, , Felsobanya in Hungary.

Covellite, CuS.

agonal. Crystals ∞P, 0P, rare; u m and granu- Cl. basal; sectile. Thin lamin flex H. 1·5 to 2; G. 4·6. Resinous. Indigo-blue, str bla B.B. burns blue flame. Sol. in n. acid. C.c. 66·7 copper, 33·3 sulphur. peg in Cornwall, Vesuvius, La g (Austria), Chili, Angola, Zealand, and Victoria.

Chalcopyrite (*Copper Pyrites*), CuS + FeS.

amidal; and sphenoidal hemihedrie; ½P (*l*) with polar edges '; ∞P∞. Crystals generally small and deformed; twins common, like fig. 340. P ∧ (*b*) 89° 10′, 2P ∧ (*c*) 126° 11′,), P (fig. 89). Most commonly compact and disseminated; botryoidal and reniform. Cl. pyramidal 2P ∧; some- rather distinct; fracture conchoidal or uneven. H. = 3·5 to = 4·1 to 4·3. Brass yellow, often with a gold yellow or ent tarnish (peacock copper ore), greenish black. B.B. on charcoal be- darker or black, and on cooling red; easily to a steel-grey globule, which at becomes magnetic, brittle, and greyish the fractured surface; with borax and ields a grain of copper; moistened with l, colours the flame blue. C.c. essenti-

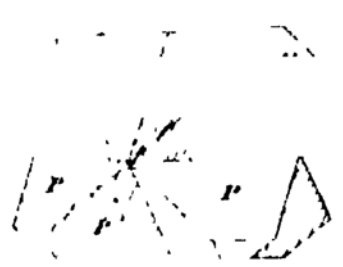

Fig. 340.

atom copper, 1 atom iron, and 2 atoms ur; with 34·5 copper, 30·5 iron, and 35 ur. The most abundant ore of copper. In Kirkcudbright- and Wigtownshire, Tyndrum in Perthshire, Inverness-shire, in Sutherland, Shetland, Anglesea (Parys mine), Derbyshire, dshire, Cumberland, Gunnislake (Devonshire), St Austell wall), Wicklow, Falun, Roraas, Freiberg, Mansfeld, Goslar, rberg, Müsen, Siberia. It is distinguished from pyrite by ng readily to the knife, by its tarnish, and by forming a green on in n. acid.

Bornite (*Purple Copper*), $3Cu_2S, Fe_2S_3$.

ic. Crystals ∞O∞, and ∞O ∧, O; but rare, and generally or uneven; also twins. Mostly massive. Cl. octahedral; ro conchoidal; slightly brittle; sectile. H. = 3; G. = 4·9 to Colour between copper-red and pinchbeck-brown, with tarnish red or brown, then violet or sky blue; streak greyish black. ets like chalcopyrite. Soluble in con. n. acid, leaving sulphur. 55·6 copper, 16·4 iron, and 28 sulphur. Crystals near Redruth t Day in Cornwall; massive at Killarney in Ireland; also y, Sweden, Mansfeld, Silesia, Tuscany, and Chili. An ore of .

Cuban, CuS, Fe_2S_3.

ic. H. = 4; G. = 4·1. Bronze-yellow; streak bronze-yellow and Barracanao in Cuba, Tunaberg and Kafveltorp in Sweden.

192. Domeykite, Cu_6As.

sotryoidal or massive; fracture uneven; brittle. H. G. = 7 to 7·5. Tin- or silver-white, inclining to yellow, ridescent tarnish. Not affected by h. acid: C.c. 71·63 co 28·37 arsenic. Calabazo in Coquimbo, and Copiapo in Ch *darite*, massive, seems an impure variety; from Condurrow near Redruth (Cornwall). *Algodonite* from Lake Superior *nite* from Mexico, and *Darwinite* (88 copper) are also or similar.

193. Melonite, $NiTe_2$.

Hexagonal; minute tabular crystals, foliated and g Metallic lustre. Reddish white; streak dark grey. C.c.: n silver 4·1, tellurium 73·4. Stamford and Calaveras (Ca

194. Sylvanite, $AgTe_2 + AuTe_3$.

Oblique prismatic, C 55° 21′. ∞P 91° 26′. P ∞ 119° 2 62° 43′. Crystals small, short tabular, and often twinned and in rows like letters, sectile, but friable. H. 1·5 to 2; G.

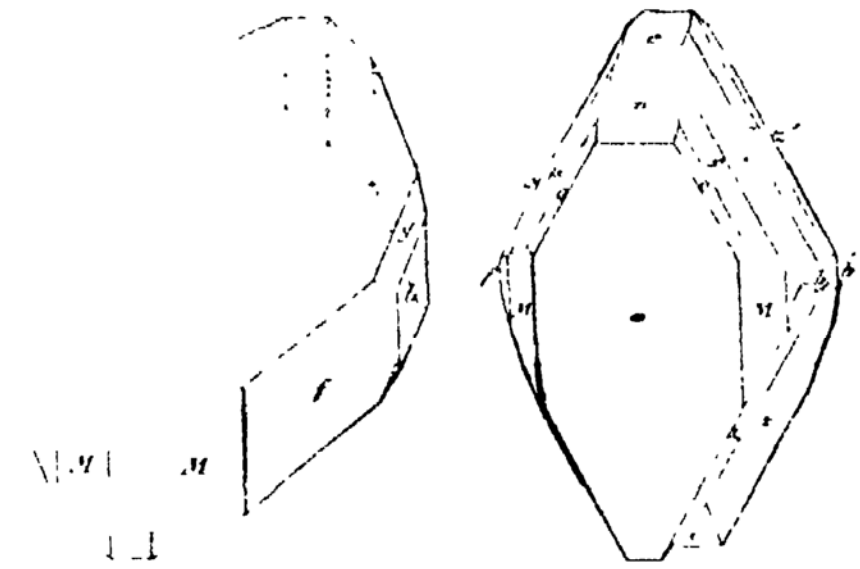

Fig. 341.

Fig. 342.

8·33. Steel-grey to silver-white, and pale bronze-yellow. C tellurium, with 0·6 to 8·5 antimony, 26·5 gold (in some 13·9 silver, with 0·2 to 1·5 lead. Offenbanya (*Graphic Tel* Nagyag (*Yellow Tellurium*), and California.

195. Nagyagite, *Black Tellurium*.

Pyramidal. P 137° 52′; P ∧ 122° 50′, and 0P (fig. 343). tabular, rare: in general in thin plates or folia ted. Cl. basal, perfect, sectile, thin lamine flexible. H. = 1 to 1·5, G. = 6·85 to 7·2. Splendent. Blackish lead-grey. C.c. 51 to 63 lead, 6 to 9 gold, 1 copper and silver, 13 to 32 tellurium, 3 to 12 sulphur, and 0 to 4·5 antimony. Nagyag and Offenbanya in Transylvania.

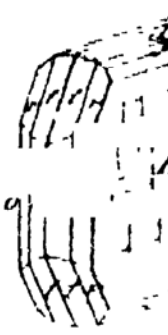

Fig. 343.

196. Maldonite, Au_2Bi.

H. = 1·5 to 2; G. = 8·2 to 9·7. Colour silver-white, with black tarnish. C.c. gold 64·5, bismuth 35·5. Occurs in granite veins at Maldon in

197. Chilenite, $Ag_{10}Bi$.

Minute plates of metallic lustre. Silver white, but tarn or yellow. Silver 83·9, bismuth 16·1. From the m Antonio near Copiapo in Chili.

198. Cinnabar, HgS.

Hexagonal and rhombohedral, R 71° 48′. R ∧ −½R (*o*), ∞ R (*i*) (fig. 344). Crystal rhombohedral, also granular, compact, and earthy. Cl. ∞R, perfect, fracture uneven and splintery, sectile. H. = 2 to 2·5, G. = 8 to 8·2. Trans- parent, with circular polarization. Adamantine. Cochineal red, streak scarlet. C.c.: 86·2 mercury, 13·8 sulphur. Idria in Carniola, Almaden in Spain, Wolfstein in Bavaria, Saxony, Hungary, Tuscany, China, Cali- fornia, Mexico, Peru. Chief ore of mercury. Also a *Hepatic Cinnabar*, a bituminous mixture.

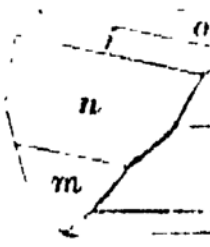

Fig. 3

199. Tiemannite, $HgSe$.

Fine-granular, brittle. H. = 2·5, G. = 7·1 to 7·4. Bright lead-grey. C.c. 75 mercury, 25 selenium. Clausthal and

200. Lerbachite, $(PbHg)Se$.

Granular and massive. G. = 7·8 to 7·88. Colour steel iron-black. Brittle. Lerbach, Tilkerode in the Harz.

201. Guanajuatite, Bi_2Se_3.

Massive; granular; foliated and fibrous. H. = 2·5 to 3, G. Blue-grey; streak grey and shining. Metallic; soft and m C.c.: selenium 34·3, sulphur 7, bismuth 65. Santa Rosa juato, Mexico).

COLORADOITE, $HgTe$.

...ve and granular. H. ... 3, G. = 8·63. Metallic. Iron-black. ...idal fracture. ... Clausthal, 39 mercury, 39 tellurium. Colorado.

MOLYBDENITE, MoS_2.

...gonal (... Crystals 0P, ∞P, and 0P, ∞P. Generally scaly. ...l, perfect ... ...ble and flexible. Feels greasy. H. 1 to 1·5; ... to 1·9. ... lead-grey with red tinge, grey streak on paper, ... on porcelain. B.B. colours flame ... yish green, on ... with ... phurous fumes, ... white coating, in warm ... ...

erg, Marienberg, Przibram, Schemnitz and Kremnitz. rg, Mexico, Nevada, &c.

Proustite, $3Ag_2S + As_2S_3$.

bohedral, like pyrargyrite, except R 107° 50′ (fig 353). to 5·6. Semi- ent to trans- on the edges. al to crimson-red. 5·5 silver, 15·1 and 19·4 sulphur. urora-red. B.B. odour, and y reduced to silver At the ralities as pyrar- both are valu- s of silver Red has a lower gravity, and streak; cumular es before the e.

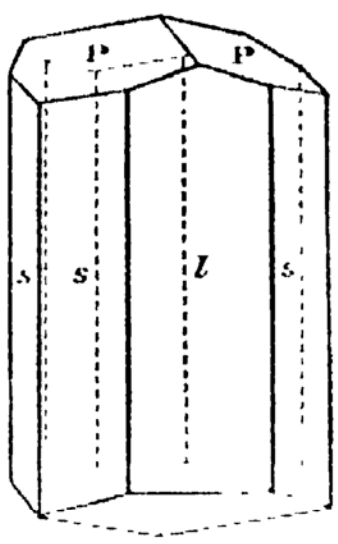

Fig. 352 (sp 225)

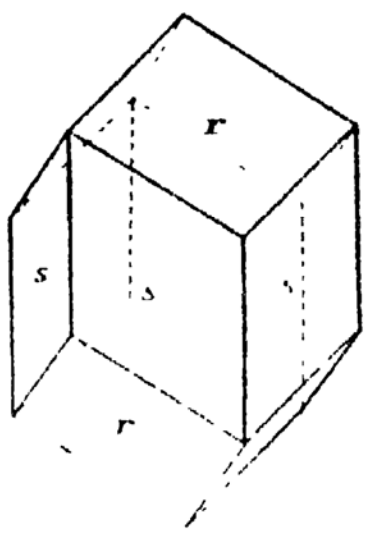

Fig. 353 (sp 226).

Boulangerite, $3PbS - Sb_2S_3$.

granular, columnar, radiating, or fibrous; rhombic-prismatic. G. = 5·8 to 6. Silky, metallic Blackish lead-grey, with streak. B.B like jamesonite Comp 59 lead, 22·5 antimony, ·2 sulphur. Molieres in France, Oberlahr (Rhenish , Lapland, and Siberia. *Plumbostib* or *Umbrathite*, from sk, is only a variety.

Kobellite, $3PbS, Bi_2S_3 + 3PbS, Sb_2S_3$.

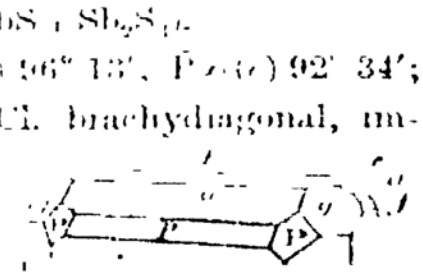
ted columnar; soft G = 6·21 to 6·3 Comp 53 lead, 20 bismuth, 10 antimony, and 17 sulphur. Hvena in Nordmark (Sweden).

Wittichenite (*Cuprous Bismuth*), $3CuS + Bi_2S_3$.

prismatic; in tabular crystals like bournonite. Wittichen Black Forest.

Bournonite ($3CuS + Sb_2S_3$) + ($3PbS + Sb_2S_3$).

prismatic. ∞P (*d*) 93° 40′, $\breve{P}\infty$ (*a*) 96° 13′, $\bar{P}\infty$ (*c*) 92° 34′; $\infty\breve{P}\infty$ (*s*); $\infty\bar{P}\infty$ (*k*) (fig. 351) Cl. brachydiagonal, imfracture uneven to conchoidal; brittle. H. = 2·5 to 3, G. 5·7



ay, and 19·6 sulphur. Rehruth eralston; Harz (Neudorf), Braunsapnik, Servoz; Alais and Pontgi- France.

hite from Wolch in Carinthia is ari ty.

Aikinite (*Needle-ore*), $2(3PbS + 3(CuS + Bi_2S_3)$.

prismatic; long thin crystals ed in quartz, often bent or broken, brittle. H. = 2·5; G. 6·7 to 6·8.

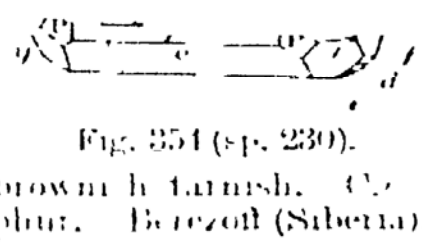


Fig. 354 (sp. 230).

h lead-grey or steel-grey, with a brownish tarnish. Co- 11 copper, 36 bismuth, and 17 sulphur. Berezoff (Siberia),

Stylotype, $3(CuAgFe)S + Sb_2S_3$.

[illegible]OLIVITE, $Bi_2O_3 + Bi_2S_3$.

[illegible]ohedral. From Bolivia.

SELENITES.

[illegible]RACOMELITE, $CuSe + 2H_2O$ [= CuO, SeO + 2H₂O].

[illegible] prismatic, C [illegible] 20′. G. = 3·76. Bright blue. Transparent [illegible] selenious acid 18·2, copper oxide 36·4, water 15·3. [illegible]cahuta, Mendoza, Argentine Republic.

NITRATES AND BORATES.

Na_2O, N_2O_5.

[illegible], 16 to 30. Tarapaca in Peru. Used in the [illegible] nitre; but deliquesces in moist air.

[illegible]TRE, KNO_3 [K_2O, N_2O_5].

[illegible] [illegible] 3′ 11·49, $2P\infty$ (P) 70° 55′, P∞ 109° 52′; [illegible] shoots with aragonite. Acicular, [illegible], or pulverulent. Fracture conchoidal. H. 1·9 to 2. [illegible] vitreous or silky. Colourless, white, or grey [illegible] and cooling. Deflagrates [illegible] acid. B. on platinum wire melts very [illegible] colouring the flame [illegible] 46·6 potash and 53·4 nitric [illegible] always more or [illegible] in the lime-tone caves of [illegible] countries, Hungary, [illegible] for producing nitric [illegible] glass-making, medicine, and the manufacture of gunpowder.

NITROCALCITE, $CaN_2O_6 + H_2O$.

[illegible]s or pulverulent. White or [illegible] [illegible] 30·8 lime, 59·3 [illegible], and 9·9 water. Limestone caves of Kentucky; on old [illegible] limestone rocks.

NITROMAGNESITE, $MgN_2O_6 + H_2O$.

[illegible] bitter. In the same places, and similar to nitrocalcite.

262. BORACITE, $2\dot{M}g_3\ddot{B}_4 + MgCl$.

Tesseral and hemihedral (figs. 63, 253, 359). Cl. octahedral, perfect; fracture conchoidal; brittle. H. = 7; G. = 2·9 to 3. Transparent or translucent; vitreous or adamantine. Colourless, or white, often greyish, yellowish, or greenish. Becomes polar-electric by heat. B.B. fuses with difficulty to a clear yellowish bead, which on cooling forms a white opaque mass of needle-like crystals; at the same time colours the flame green. [illegible]d in hot acid. Ore [illegible] boracic acid, 26·9 magnesia, 7·9 chlorine, and 2·7 magnesium. Lüneburg, Strassfurt in Holstein, Stassfurt.

Fig. 359.

263. STASSFURTITE.

In very minute prismatic crystals. White. C.c. same as boracite, and thus perhaps dimorphous. Stassfurt.

264. RHODIZITE, $2(\dot{C}s_2\ddot{B}_4 + \dot{K}_2\ddot{B}_4) + \ddot{B}_2$.

H. = 8 and G. = 3·3 to 3·42, agrees in most characters with boracite. Pyro-electric. Mursinsk in Siberia.

265. LUDWIGITE, $2MgB + FeFe$.

Fibrous, massive. From limestone at Moravitza in the Banat.

266. BORAX + *Tincalconite*, $Na_2\ddot{B} + 10\dot{H}_2$.

Oblique prismatic, C [illegible] 2′. ∞P 87°; P 122° 34′ (fig. 360). Almost isomorphous with aucite, brittle. H. = 2 to 2·5. G. = 1·7 to 1·8. Pellucid, resinous. Colourless, or yellowish, greenish, and greyish white. Taste feebly alkaline and sweetish. C.c.: 16·4 soda, 36·6 boracic acid, and 47·1 water; but often with 2 phosphoric acid or other impurities. Shores of salt lakes in Tibet and Nepal, in California, and near Potosi.

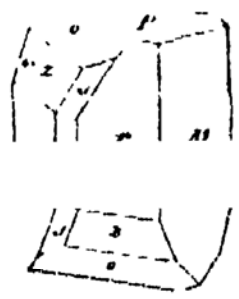

Fig. 360 (sp. 266).

267. BORACALCITE, $Ca2B + 6H$.

Similar to ulexite (sp. 268), and from same locality.

268. ULEXITE, $Na_2\ddot{B} + 2\dot{C}a_2\ddot{B} + 18\dot{H}$.

Fibrous. H. = 1; G. = 1·6. White. Tasteless. Iquique and Nova Scotia.

269. SZAIBELYITE, $2Mg_2\ddot{B} + 3\dot{H}_2$.

H. = 3·5, G. = 2·7. Werkesthal in Hungary.

270. HYDROBORACITE, $2Ca\ddot{B}_3 + 2Mg\ddot{B}_3 + 12\dot{H}_2$.

Radiating and foliated. Caucasus. A similar mineral, with soda in place of magnesia, is found in Peru.

271. STERNBERGITE, $(Mn, Mg)_3\ddot{B} + \dot{H}_2$.

Fibrous, silky. White. H. = 2–3; G. = 3·4. Franklin (Sussex county, New Jersey).

ANHYDROUS CARBONATES.

272. CALCITE (*Calc-spar, Calcareous Spar*), $\dot{C}a\ddot{C}$.

Hexagonal and rhombohedral, R 105° 5′ (fig. 101). The forms and combinations exceed those of any other mineral. Among them are more than fifty rhombohedrons, especially $-\frac{1}{2}R$ 135°; R; $-2R$ 79°, and $4R$ 60°, with 0R and ∞R as limiting forms. There are one hundred and fifty-five distinct scalenohedrons, as R3; R2; $\frac{1}{2}R3$, and the second hexagonal prism $\infty P2$. Hexagonal pyramids are among the rarer forms. Some of the most usual combinations are ∞R, $\frac{1}{2}R$ (∞R, $\frac{1}{2}R$, for 1·4); or $\frac{1}{2}R$, ∞R, very frequent; also ∞R, 0R, likewise $-2R$, R (∞R, $-\frac{1}{2}R$, fig. 107); R3, ∞R, $-2R$; R5 (*y*), R3 (∞R), R ($\infty P2$), $4R$ (∞R, $\infty P2$) (fig. 109); R, R3 (fig. 108). Several hundred distinct combinations are known.

Hemitropes and twins are not uncommon. These occur with the axes parallel (figs. 106, 146, 148, 180, 366, 367). Others

Fig. 361.

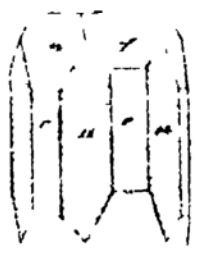

Fig. 362.

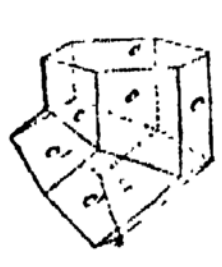

Fig. 363.

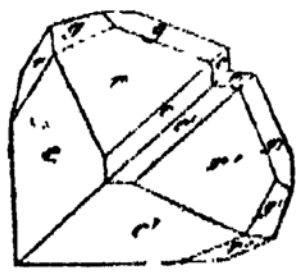

Fig. 364.

are conjoined by a face of R, the axes being almost at right angles, 89° 8′ (figs. 183, 369) or by a face of $-\frac{1}{2}R$, in which the chief axes form an angle of 127½°; and usually many times repeated, so that the centre crystals appear in lamellæ not thicker than paper (fig. 181); at an obtuse angle, as figs. 149, 363, or an acute

angle, as figs. 364, 368. Also occurs granular, lamellar, parallel or radiated fibrous, compact and earthy. Cl. rhombohedral along R, very perfect and easily obtained, so that the conchoidal fracture is rarely observable; brittle. H. = 3; G. = 2·6 to 2·8; pure transparent crystals = 2·72. Pellucid in all degrees. Very distinct double refraction. Lustre vitreous, but several faces resinous, and OR pearly. Most frequently colourless or white, but often grey, blue, green, yellow, red, brown, or black; streak greyish white. B.B. infusible, but becomes caustic and emits a bright light. Effervesces, and is entirely sol. in h. or n. acid. The fine powder, ignited on platina foil over the spirit-lamp, forms a somewhat connected mass, and even adheres to the platina. Consists of the purest varieties, carbonate of lime, with 44 carbonic acid and 56 lime, but usually contains magnesia and protoxide of iron or of manganese. Remarkable specimens of the crystallized variety or proper calc-spar are found at Alston Moor in Cumberland (flat rhombic crystals) and in Derbyshire (pale yellow

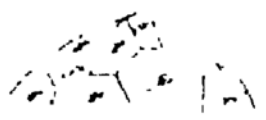

Fig. 365.

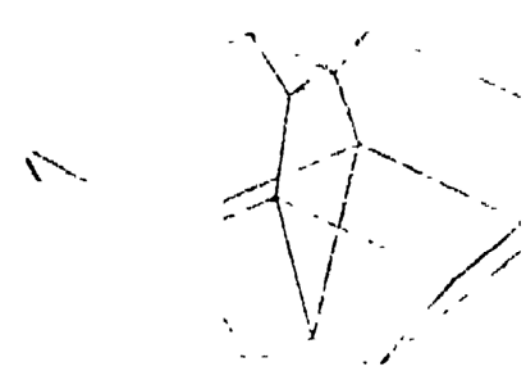

Fig. 366.

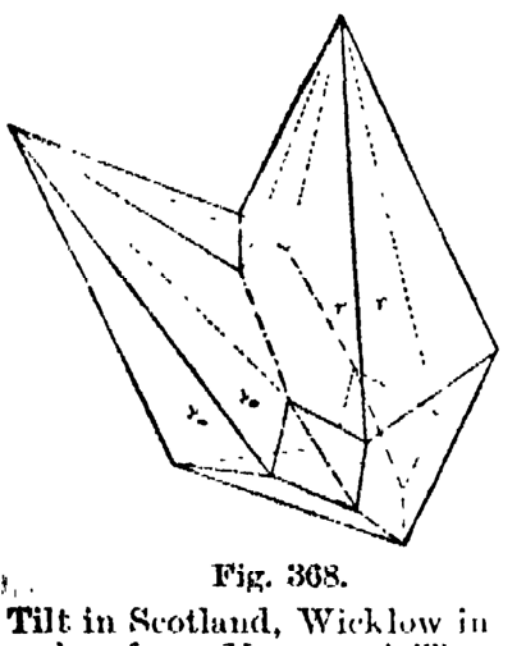

Fig. 368.

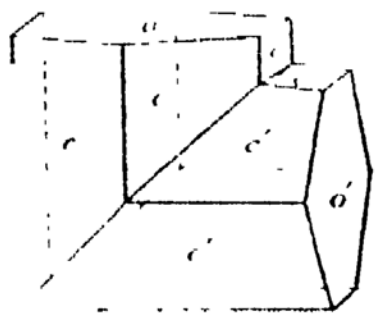

Fig. 369.

transparent pyramids), at Strontian, Elie in Fife (figs. 370, 371, 372), Andreasberg and other parts of the Harz (six-sided prisms), and at Freiberg, Tharand, and Maxen in Saxony.

Certain varieties are distinguished. *Iceland Spar*, remarkable for its transparency and double refraction, occurs massive and in huge crystals in a trap rock in Iceland. *Slate Spar*, thin lamellar, often with a shining white pearly lustre and greasy feel, Aberdeen and Glen Tilt in Scotland, Wicklow in Ireland, and Norway. *Aphrite*, fine scaly; from Hesse and Thuringia. *Marble* is the massive crystalline variety of this mineral, produced by igneous action on compact limestone. Paros, Naxos, and Tenedos furnished the chief supply to the Grecian artists; Carrara, near the Gulf of Genoa, to those of modern times. Some of the coloured marbles

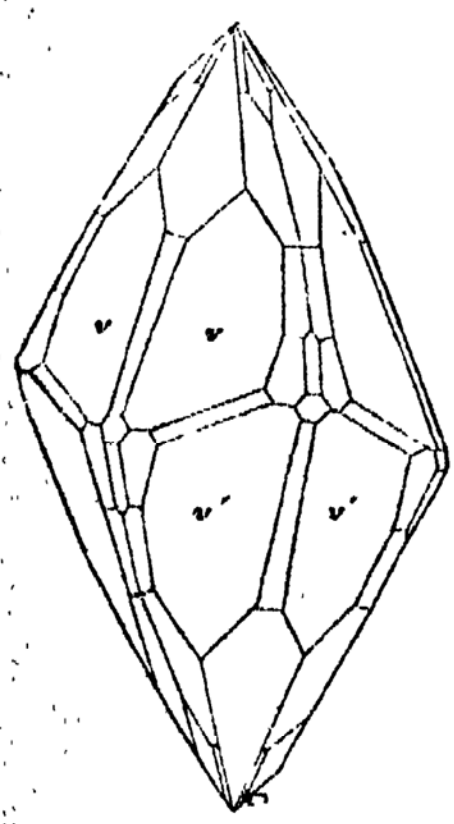

Fig. 370.

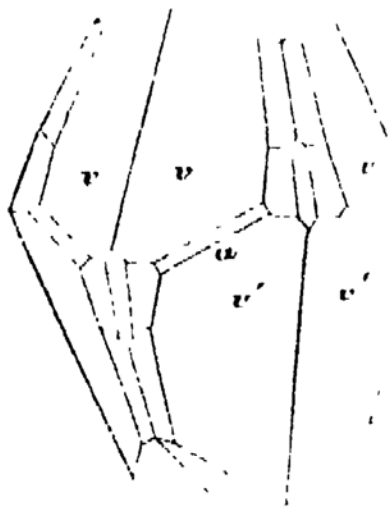

Fig. 371.

of the ancients were impure limestones, as the *Cipollino*, zoned with green talc or chlorite, and *Verde Antique*, mixed with green serpentine. *Ruin Marble* shows irregular markings like Val d'Arno (Florentine marble), and Bristol (Cotham). *Lucullite* from Egypt, and *Anthraconite*, from Campbellton, Kilkenny, are black from carbon. *Lumachello*, from Bleiberg, Carinthia, exhibits beautiful iridescent colours from fossils; sometimes deep red or orange (*Fire Marble*). *Hislopite*, Poonah, is green, from celadonite.

Limestone occurs in all formations under various names, as egg-stone, or roe-stone, rounded concretions with a concentric structure like the roe of a fish; *Pisolite*, or pea-stone, similar structure; *Chalk*, soft earthy; *Lithographic Stone*, yellowish and compact, from Solenhofen; and *Marl*, calcareous matter more or less mixed with clay. *Calcareous Tufa*, generally a recent deposit from calcareous springs, has often a loose friable texture, but at other times is hard and compact; and in the neighbourhood of Rome forms the common building stone *Travertino*. The sandstone of Fontainebleau is carbonate of lime (95) mixed with quartz sand (5), and occasionally crystallizing in rhombohedrons.

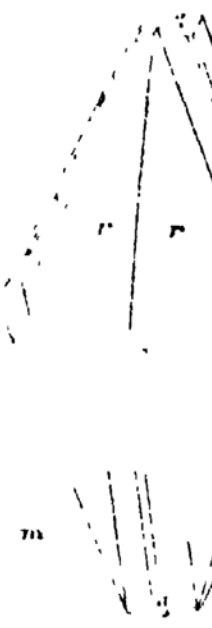

Fig. 372.

This mineral is employed in many ways: the coarser varieties, when burnt to drive off the carbonic acid, as lime, for mortar, manure, tanning, &c.; as a flux in melting iron and other ores, or in preparing glass, and for similar purposes; the finer, as marbles, for sculpture, architecture, and ornamental stone work; the chalk for writing, washing, or producing carbonic acid.

Plumbocalcite. Cl. 101 5′. White and pearly, soft; calc-spar, but G. = 2·8–2·4. Contain 2·3 to 7·8 carbonate of lead. Wanlockhead and Leadhills (Scotland).

273. DOLOMITE (*Bitter-spar*), $CaC + MgC$.

Hexagonal rhombohedral, R 106° 15′ 20″; most frequent R. The rhombohedrons often curved and saddle-shaped, granular or compact, often cellular and porous. Cl. rhomb. H. 3·5 to 4·5, G. = 2·85 to 2·95. Translucent, vitreous, often pearly. Colourless or white, but frequently pale red or green. B.B. infusible, but becomes caustic and often traces of iron and manganese. Fragments effervesce very little or not at all in hydrochloric acid; the powder is partially or wholly when heated. Consists of 54·3 carbonate of lime and 45·7 carbonate of magnesia, but generally carbonate of lime with less than 20 per cent. carbonate of magnesia and less than 20 carbonate of iron.

Varieties are *Dolomite*, massive-granular, easily divisible; *Rhomb* or *Bitter-spar*, larger grained, or distinctly crystallized, cleavable, often nearly white to green; and *Brown-spar* and *Pearl-spar* in simple crystals generally curved (fig. 373) or in imitations of colours inclining to red or brown, more distinct pearly lustre, under 16 per cent. carbonate of iron. Leadhills and Glen Tilt in Scotland, Alston in Cumberland, in Derbyshire, Traversella Piedmont, St Gotthard, Gap in France, Greenockite, twinned, in Tuscany (*Micaceo*), and Tharand in Saxony (*Transcendent*).

The massive and compact varieties are very common, valued as building stones; state trial of Milton, Vol. Manchester Houses of Parliament at Westminster. The Parian marble also the Sutherland and Iona marbles, belong to this species.

271. ANKERITE, $CaC + MeC$.

R 106° 12′. Usually massive and granular. G. = 2·9. Otherwise like dolomite. Ores of Shetland, Styria.

275. MAGNESITE, MgC.

Rhombohedral; 107° 10′ 40″. Reniform or massive. G. = 2·85 to 2·95. Subtranslucent or opaque; streak white. Snow-white, greyish or yellowish white, and pale yellow. Norway, North America.

276. BREUNNERITE (*Gurhofite*), $MgC + (MnFe)C$.

Hexagonal rhombohedral, R 107° 10′ 30″. Granular or massive. Cl. R, very perfect. H. = 4 to 4·5; G. = 2·9 to 3·1. Translucent or translucent on the edges; highly vitreous. Colourless, yellowish brown or blackish green. Consists essentially of magnesia, with 51·7 carbonic acid and 48·3 protoxide of iron mixed with 8 to 17 carbonate of iron or manganese. Salzburg, Fassa Valley, &c., St Gotthard, Harz.

277. SIDERITE (*Spathic Iron*, *Chalybite*), FeC.

Hexagonal and rhombohedral. R 107°. Usually R of the saddle-shaped (fig. 252), or lenticular. Cl. rhombohedral, perfect, brittle. H. = 3·5 to 4·5, G. = 3·7 to 3·9. Translucent in various degrees, becoming opaque when we observe, vitreous. Rarely white, generally yellowish grey or yellowish brown.

blackish brown on exposure. B.B infusible, but becomes magnetic, with borax and salt of phosphorus shows or iron, with soda often manganese. In acids soluble effervescence. Cornwall carbonate of iron, with 62·1 protoxide of 37·9 carbonic acid but usually 0·5 to 10 or even 25 of manganese, 0·5 to 15 magnesia, and 0·1 to 2 lime. Varieties. In beds or masses in Braunton in Devonshire, Cumberland, and in many of the tin-mines in Styria, Carinthia, and Westphalia; in veins in Anhalt Pyrenees and the Basque provinces of Joachimsthal, Freiberg,

grey blue brown, or black. G. 2·8 to 3·5
magnetic variety

Mine

Crystallization, Zinc
hombohedral, R 107° 40'. Usually uniform, stal
mmer or granular. Cl. R, perfect, but curved; fracture
hoidal; brittle. H. 5, G. 4·1 to 4·5. Translucent
pearly or vitreous. Colours but often pale greyish
wn, or green. Or: 64 zinc oxide and 35·2 carbonic
ntic in Somerset-shire, Matlock in Derby-shire, compact at
ur, Ches vy near Lyons, Altenberg near Verviers, Chapelle,
Westphalia Tarnowitz in Silesia, Hungary, Siberia

ARAGONITE, CaC.

Crystallization. ∞P 116° 10', $P\infty$ 108° 28'. The most common
ons are $\infty P\infty$ (*b*), $\infty P(M)$, $P\infty$ (*d*), *P* (fig. 275), generally
nate (like the separate crystals in fig. 164), $\infty P\infty$, ∞P,
ally short prismatic; crystal of 6 P, ∞P, $P\infty$, $6P\infty$ (*q*)
ate pyramidal. But simple crystals are
the great tendency to form twins, com
a face of ∞P, and repeated either in
angement (fig. 176) or in rosette groups
186). Also columnar, fibrous and re
alactite, and other forms. Cl. brachy-
distinct, fracture conchoidal or uneven
to 4. G. 2·9 to 3·0; rises to 2·95. Trans
translucent, vitreous. Colourless, but
white to brick-red, also light green
or grey. In the closed tube, before
red heat, it swells, and falls down in
coarse powder, evolving a little water
Leadhills, Valencia, Molina and el
Aragon; Leogang in Salzburg, and Arto-
Strontianite, cornflood, in the iron-mines of
Witherite, fine fibrous silky, at Dutton
chester. Sulcatine, coast of Galloway
Buckingham-shire, and Devon-shire. Also

nce in nitric acid. Or: 22·3
acid and 77·7 baryta. Alston
Hexham in Northumberland
tyria, Salzburg, Hungary, Scotland
nd Cuba.

Fig. 374.

ALSTONITE, $BaC + CaC$.

prismatic. ∞P 118° 50'; $2\breve{P}\infty$ 111° 50', usual combination
∞P, resembling an hexagonal pyramid (fig. 375). Cl. ∞P
and $\infty\breve{P}\infty$, rather distinct. H. = 4 to 4·5; G. = 3·65 to 3·76.
3·76. Translucent; weak resinous.
Colourless or greyish-white. Or:
66 carbonate of baryta and 34
carbonate of lime. Fallowfield near
Hexham, and Alston Moor.

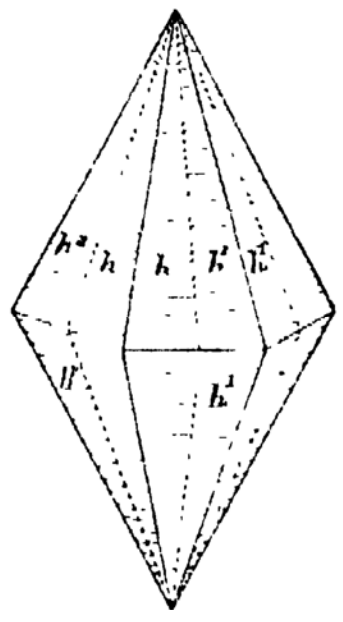

Fig. 375 (sp. 283).

284. STRONTIANITE, SrC.

Right prismatic. ∞P 117° 19',
$P\infty$ 108° 12'. Crystals (fig. 376)
and twins like aragonite, also broad
columnar and fibrous. Cl. pris-
matic along ∞P (*M*). H. 3·5,
G. = 3·6 to 3·8. Translucent or
transparent, vitreous or resinous
on fracture. Colourless but often
light asparagus or apple
rarely greyish, yellowish
ish. B.B. fuses in a strong heat
only on very thin edges intumesces
in cauliflower-like forms, shines
brightly, and colours the flame red; easily soluble in acids, with
effervescence. Or: 30 carbonic acid and 70 strontia, but often
contain carbonate of lime (6 to 8).
Strontian in Argyllshire, Sutherland, Leogang in Salzburg, Braunsdorf in Saxony, Hamm in Westphalia, the Harz, at Schoharie (N.Y.) and elsewhere in United States (*Emmons*). It is used to
produce red fire in pyrotechnic exhibitions.

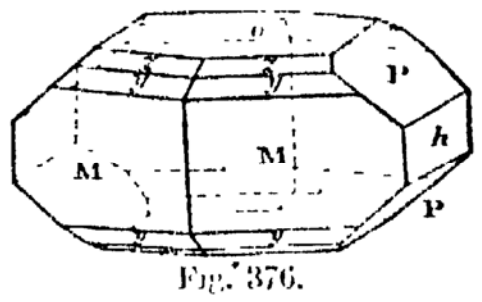

Fig. 376.

285. MANGANOCALCITE, $(Mn, Ca, Fe)\breve{C}$.

Right prismatic; in prisms like aragonite, and bears the same relation to dialogite that aragonite does to calc-spar. H. = 4 to 5; G. = 3·03. Red or reddish white. Vitreous. Schemnitz.

286. CERUSSITE (*Lead Spar*), PbC.

Right prismatic, isomorphous with aragonite and nitre. ∞P (M) 117° 14', $\breve{P}\infty$ 108° 16'; $2\breve{P}\infty$ (*u*) 69° 20'; also $0P$, P (*t*); $3\breve{P}\infty$ (*s*); $\infty\breve{P}\infty$ (*l*); $\infty\breve{P}3$ (*i*) (fig. 377). Twins common (figs. 158, 159, 378, 379). Also granular or earthy. Cl. ∞P and $2\breve{P}\infty$, rather distinct; fracture conchoidal; easily frangible. H. = 3 to 3·5; G. = 6·4 to 6·6. Transparent or translucent; adamantine or resinous. Colourless and often white, but also grey, yellow, brown, black, rarely green, blue, or red; streak white. B.B. decrepitates violently, but easily fused and reduced; soluble with effervescence in n. acid. Or: 83·5 protoxide of lead and 16·5 carbonic acid. Very common. Leadhills, Wanlockhead, Keswick, Alston Moor, Beeralston in Devonshire, St Minver in Cornwall; Przibram, Mies, and Bleistadt;

BARYTES, BaS

right pri matic, P 78° 20′, P∞ (*y*) 105° 22′, ∞P2 (*o*) 77°
also ∞P∞ (*x*) 78° 13′, but on a different portion,
being placed ver
crystals show very many forms
combinations, and
columnar often in druses or
; also foliated, fibrous, granular, or compact. Cl brachy-
pinacoidal perfect, also P basal, traces H. 3
G 4·3 to 4·6 Transparent to translucent; vitreous
nous Colourless and white, but frequently reddish white,
flesh-red, yellow, grey, blue, brown, or black B.B.
decrepitates violently, and fuses, often with a flash, or only on the
colouring the flame yellowish green Not soluble in acids.
34·3 sulphuric acid and 65·7 baryta, but occasionally
to 15 sulphate of strontia Very common, chiefly in veins,
alone or accompanying ores Crystallized at Arran, Strontian,
Sutherland; Dufton, Bohemia, Felsobanya and Kremnitz in
Hungary, Auvergne, and United States. Columnar at Freiberg. The radiated from near Bologna, or the *Bolognese Stone*, phosphoresces in the dark. Massive, or *Cawk*, from Derbyshire and Staffordshire, Leadhills, and Arran.

Lime Barytes, from Derbyshire, Strontian, Freiberg, seems a mixture with sulphate of lime; crystals tabular, in rosettes and other groups, G. 4 to 4·3. *Hepatite*, dark grey, from carbonaceous matter; Kongsberg. *Allomorphite*, scaly, white, and pearly, near Rudolstadt, agrees essentially with barytes.

314. BARYTO-CELESTINE, $2SrS + 3BaS$.

Radiated and foliated. Bluish white. Brittle and friable. H. = 2·5, G. = 3·92 Difficultly fusible. Lake Erie, Upper Canada, and Binnenthal

315. CELESTINE, SrS

Right prismatic, forms like barytes and anglesite. P∞ (*o*) 104° 8′, P (*M*) 75° 52′ and combinations. P∞, P∞, ∞P∞; or this with ∞P2 (*d*) also columnar and foliated; or fibrous, fine granular, or compact. Cl macrodiagonal, perfect; along P∞ less perfect H = 3 to 3·5, G = 3·9 to 4 Transparent or translucent; vitreous or resinous. Colourless, but usually bluish white to milk-blue, and rarely reddish or yellowish B.B. decrepitates and fuses easily to a milk white globule; colours the flame carmine-red. Distinguished from barytes by a splinter, after ignition in the inner flame, on being moistened with hydrochloric acid, and held in the blue border of the flame of a candle, colouring this of a lively purple red Scarcely affected by acids. Ce.: 43·6 sulphuric acid and 56·4 strontia, but often one baryta or lime. Tantallon Castle, Calton Hill, Clachnabarry; near Bristol and Knaresborough, sulphur mines of Girgenti and other parts of Sicily, Herrengrund in Hungary, Bex, Salzburg, Monte Viale near Verona, and Meudon and Montmartre near Paris. Used for producing a red light in pyrotechnic mixtures.

Fig. 393.

316. ANGLESITE, PbS

Right prismatic, ∞P 103° 43′; P∞ 75° 35′. The crystals, of many forms and combinations, are short prismatic, pyramidal, or tabular. Cl. prismatic along ∞P, and basal; fracture conchoidal very brittle. H 3; G 6·2 to 6·35. Transparent or translucent, adamantine or resinous. Colourless and white, but occasionally yellow, grey, brown, or blue, streak white. Decrepitates in candle, B.B. on charcoal fuses in the oxygen flame to a milk white bead, very difficultly soluble in acids, wholly in solution of potash. Ce. 73·7 lead protoxide and 26·3 sulphuric acid. Leadhills (fig. 397), St Ives in Cornwall, Derbyshire, Parys mine in Anglesea; Zellerfeld, Klausthal, Badenweiler, Siegen, Silesia, Linares, Phoenixville in Pennsylvania.

317. LANARKITE, $PbS + Pb$.

Oblique prismatic ∞P 49° 50′ Cl. basal, perfect; sectile; thin lamina flexible H 2 to 2·5; G. = 6·3 to 6·7. Transparent;

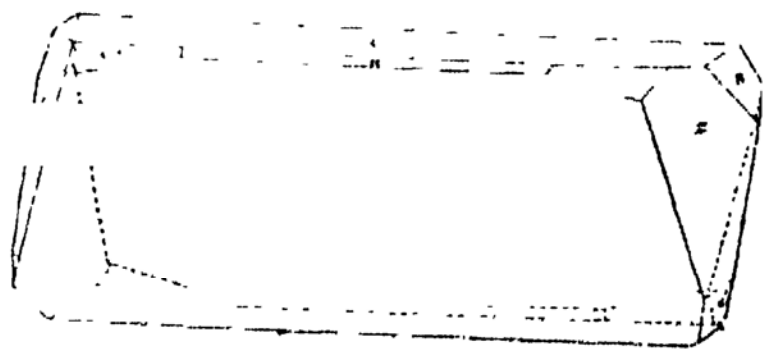

Fig. 398.

resinous or adamantine; on 0P pearly. Greenish or yellowish white, inclining to grey; streak white. B.B. on charcoal fuses to a white globule containing metallic lead; partially soluble in n.

h effervescence. C.c.: sulphate of lead 57·6, oxide of lead Leadhills; rare.

HYDROUS SULPHATES.

MIRABILITE (*Glauber Salt*), $Na_2S + 10H_2$.

no prismatic, C 72° 15′. Cl. orthodiagonal; fractur dal. H. = 1·5 to 2; G. = 1·4 to 1·5. Pellucid and colour c.: 19·2 soda, 24·8 sulphuric acid, and 56 water As rescence in quarries, on old walls, or on the ground, in ers of lakes and springs in Russia and Egypt, and on s on lava.

GYPSUM, $CaS + 2H_2$.

ne prismatic, C 80° 57′. The most common forms are ′30′; P 138° 40′; −P 113° 30′, and ∞P∞. Two common ations are ∞P(*f*), ∞P∞ (*o*), −P (*l*) the 129°, and the Lenticular crystals often occur; hemitropes frequent fres , 151); also granular, compact, fibrous, scaly, or pulverulent odiagonal perfect, along P much le perfect flexible. H. = 1·5 to 2 (lowest on P), G. to 2·4 rent or translucent; vitreous, on cleavage ss, and snow-white, but often red, grey, yell d rely greenish or bluish. In the closed tube comes opaque and white, soluble in 100 t carcely more so in acids. C.c.: 46·5 sulph id, nd 20·9 water.

parent crystals, or *Selenite*, occur in the cl ins of Be erland, of the Tyrol, Salzburg, and Bohemia, the sulphur f Sicily, at Lockport in New York in porphy at Gomeck, lay of Shotover Hill near Oxford, at Chalky n Bath, and ther localities. Fibrous gypsum at Comp Matlock in ire, and at Ilfeld in the Harz. Compact ex ure in whole many parts of England, Germany, France, ed Italy, at in Tuscany (*Alabaster*) often with to k. The finer s (or alabaster) are cut into various ornamental articles.

KIESERITE, $MgS + H_2$.

mbic, but chiefly massive. G. = 2·57. Pellucid, greyish C.c.: magnesia 29, sulphuric acid 58, water 13. In beds at t.

EPSOMITE (*Epsom Salt*), $MgS + 7H_2$.

prismatic. P mostly hemihedric, ∞P 9 oP (*M*),), P (*l*) (fig. 399). Granular, fibrous, iv. Cl agonal, perfect. H. 2 to 2·5. Pellucid; vitreous; and white itter. C.c.: 16·32 magnesia, 32·53 acid, and 51·15 water. Efflorescence us rocks, as at Hurlet near Paisley Montmartre, and Freiberg; on the in Spain and the Russian steppe ral waters, as at Epsom in Surrey, tz and Seidlitz in Bohemia. Used in e.

GOSLARITE (*White Vitriol*), ZnS

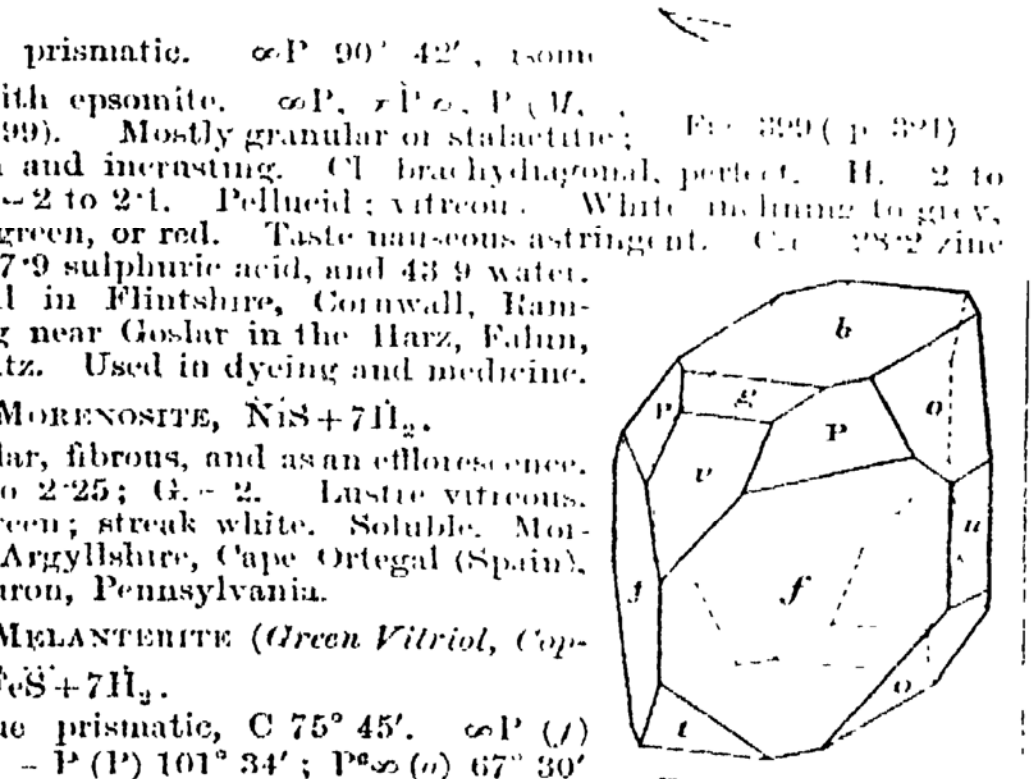

Fig. 400 (sp. 324).

prismatic. ∞P 90° 42′, isom ith epsomite. ∞P, ∞P∞, P (*M*, 99). Mostly granular or stalactitic; and incrusting. Cl. brachydiagonal, perfect. H. = 2 to ; G. = 2 to 2·1. Pellucid; vitreous. White inclining to grey, green, or red. Taste nauseous astringent. C.c.: 28·2 zinc 7·9 sulphuric acid, and 43·9 water. d in Flintshire, Cornwall, Ramg near Goslar in the Harz, Falun, tz. Used in dyeing and medicine.

MORENOSITE, $NiS + 7H_2$.

lar, fibrous, and as an efflorescence. o 2·25; G. = 2. Lustre vitreous. reen; streak white. Soluble. Mor- Argyllshire, Cape Ortegal (Spain), ron, Pennsylvania.

MELANTERITE (*Green Vitriol, Cop-*

$FeS + 7H_2$.

ue prismatic, C 75° 45′. ∞P (*l*) − P (P) 101° 34′; P∞ (*o*) 67° 30′ ; chiefly stalactitic, reniform, or in Cl. basal, perfect; prismatic less so. H. = 2; G. = 1·8 to 1·9 ent, rarely transparent; vitreous. Leek- or mountain-green. h a yellowish coating; streak white. C.c.: 26 protoxide of sulphuric acid, and 45 water. Hurlet near Paisley, is, Rammelsberg, Falun, Schemnitz, Bilin. Used in dyeing, and in manufacturing ink, Prussian blue, and sulp acid.

325. SMIKITE, $Mn_2S + H_2$.

Stalactitic aggregates. Rose to white. Felsobanya (Hung

326. MALLARDITE, $MnS + 7H_2$.

Crystalline foliated masses, apparently oblique prismatic. Bay mine in Utah.

327. BIEBERITE (*Cobalt Vitriol*), $CoS + 7H_2$.

Oblique prismatic, usually stalactitic, or an efflorescence. rose-red. C.c.: 20 cobalt oxide, 1 magnesia, 29 sulphuric acid 47 water. Bieber near Hanau, and Leogang

328. ALUNOGENE (*Hair-Salt*), $Al_2S + 15H$.

Capillary or acicular, in crusts or reniform masses. H. 2; G. = 1·6 to 1·7. Silky. White, inclining to green or y C.c.: 36 sulphuric acid, 15·4 alumina, 48·6 water. Volcanic South America, in coal and lignite in Germany, and on old wa

329. ALUMINITE (*Websterite*), $Al_2S + 9H$.

Reniform, and very fine scaly, or fibrous. Fracture ear sectile or friable. H. = 1, G. = 1·7. Opaque, dull or glimme snow-white or yellowish white. C.c.: 29·8 alumina, 23·2 sulp acid, and 47 water. Newhaven in Sussex, Epernay, Autenil Lunel Viel in France; Halle and Morl in Prussia. *Edelfo* from Hungary, in rhombic tubes, is similar, but has 1 cent. of water.

330. COQUIMBITE, $Fe_2S + 9H_2$.

Hexagonal. P 58°. Crystals oP, with ∞P and P; us granular. Cl. ∞P, imperfect. H. = 2 to 2·5, G. = 2 to White also brown, yellow, red, and blue. C.c.: 28·5 iron pero 42·6 sulphuric acid, and 28·9 water. Copiapo in Chili, and C in Bolivia.

331. COPIAPITE, $2Fe_2S + 13H_2$.

Six-sided tables; but system uncertain; also granular. Cl fect. Translucent, pearly. Yellow. C.c.: 34 iron peroxid sulphuric acid, and 21 water. Copiapo in Chili. Also radi fibrous masses, dirty greenish yellow, metamorphic the fo with 32 sulphuric acid and 37 water. Both probably mixture *Fibrous ferrite*, also from Chili, and *Yellow Iron Ore* from the b coal at Kolosoruk in Bohemia and Modum in Norway, are reniform, or compact and earthy. H. = 2 to 3, G. = 2·7 t Colour ochre-yellow. *Ipatite*, reniform-earthy, yellow, Auteuil near Paris, is granular, also *Vitriol Ocher* from I *Misy*, from Rammelsberg in the Harz, containing sulphates of copper, zinc, and other metals, is a product of decomposition.

332. PISSOPHANE, $Al_2Fe_2S + 15H_2$.

Stalactitic; fracture conchoidal, very easily frangible. H. G. = 1·9 to 2. Transparent or translucent, vitreous. Olive- to liver-brown, streak greenish white to pale yellow. C.c.: alumina, 10 to 40 iron peroxide, 12 sulphuric acid, and 41 w Saalfeld and Reichenbach in Saxony.

Carphosiderite, reniform, opaque, resinous, and straw-yellow, a greasy feel, is related. H. = 2·5, G. = 2·5. Consists of hydrous sulphate of iron. Labrador.

333. CHALCANTHITE, $CuS + 5H_2$.

Anorthic. ∞P ∞ : ∞P ∞ (*r*) 79° 19′, P (*l*) : ∞P (*T*) 117° 40′, P : *r* 120° 50′, P : *T* 103° 27′, ∞P (*T*) : ∞P (*M*) 123° 10′ (fig. 401). Generally met with Cl. *T* and *M*, imperfect. H. = 2·5, G. = 2·2. Blue. C.c.: 32 protoxide of copper, 32 sulphuric acid, 36 w Cornwall, Wicklow, Hungary, T Falun, and on lava of Vesuvius.

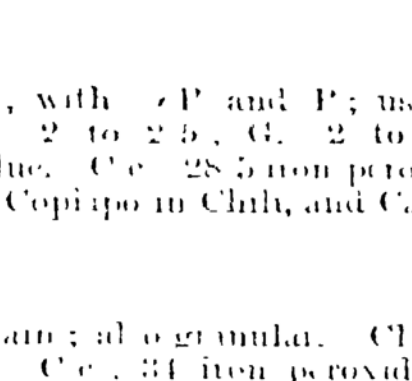

Fig. 401 (sp. 333).

334. BROCHANTITE, $CuS + 3CuH_2$.

Right prismatic. ∞P 101° 32′, 15° 37′, and ∞P∞ al reniform brachydiagonal, perfect. H. = 3·5 to G. = 3·75 to 3·9. Transparent or t lucent; vitreous. Emerald or blac green; streak bright green. C.c. copper protoxide, 18 sulphuric and 12 water. Sandlodge (Unst), Roughton Gill in Cum

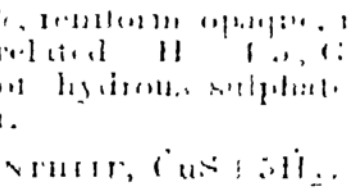

Fig. 402 (sp. 334).

Rezbanya, Elaterolite; also Krisuvig in Iceland (*Stigite*).

LANGITE, $CuS \cdot CuSO_4 + 2H_2O$.

[illegible] $P = 120° 44'$. Crystals long tabular, mostly [illegible]. Also in botryoidal and concretionary crusts, with [illegible]. Cl. basal and brachydiagonal. H = 2·5, G = 3·5. [illegible] Copper protoxide, 16·4 sulphuric acid, [illegible] water. Cornwall [illegible] also *Krisuvig* from Siberia.

[illegible] (*Leonhardite*)

[illegible] Cl. [illegible]. Crystal similar to [illegible] Color flesh-red; natural [illegible] in concretionary [illegible]. H = [illegible]; G = 3·19. Semitransparent, [illegible]. Dull lustre. Bright-green [illegible] oxides [illegible] oxide of copper 5·99, sulphuric acid 29·02, water [illegible]. Chessy-shaft, Bohemia; Johann-Georgenstadt.

[illegible] $(MgNa_2S + 9H_2O)$

[illegible] Cl. [illegible]; $P = 112° 15'$; $\infty P2 = 119° 35'$; [illegible]; $P\infty$, $P\infty$, ∞P, $\infty P\infty$, $P\infty$, P, [illegible]. In prismatic [illegible]. H = [illegible]. Transparent. White or [illegible] sulphuric acid, 8·5 soda, [illegible] and 21·5 water. Salt lake [illegible] Volga near Astrakhan, Inder, and near Mendoza in South [illegible] from Seidlitz-similar, but [illegible].

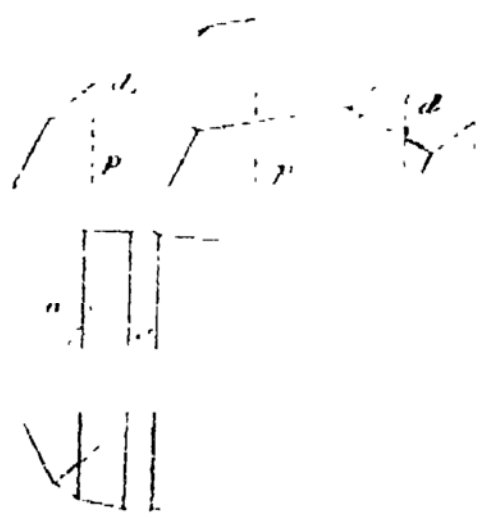

Fig. 403 (sp. 335).

[illegible] $(2Na_2S + MgS) + 5H_2O$. [illegible] but only compact [illegible] [illegible], also octahedral, with [illegible] 11′ and 105° 2′. H = 2·5 [illegible] 1·76. Vitreous. Yellow [illegible] to flesh-red. Ca, [illegible] 20 soda, 13 magnesia, 52 sulphuric [illegible] 15 water. Ischl.

[illegible] $(K_2S + CaS + H_2O)$

[illegible] prismatic, C = [illegible]; ∞P 7[illegible]; [illegible] Crystals $\infty P\infty$ (*a*), $0P$ (*c*), ∞P (*p*), $\infty P2$ (*p′*), $2P2$ (*o*), P (*o′*), $2P$ (*n*), $P\infty$ (*d*), Fig. 414 (sp. 358).

EOSITE.

...nidal. oP (*c*) : *p*′ 117° 10′; *p*′ : *p* 125° 16′ (fig. 415). H. = 3 ...Colour deep aurora-red. Streak orange ... A vanadio-molybdate of lead. Lead

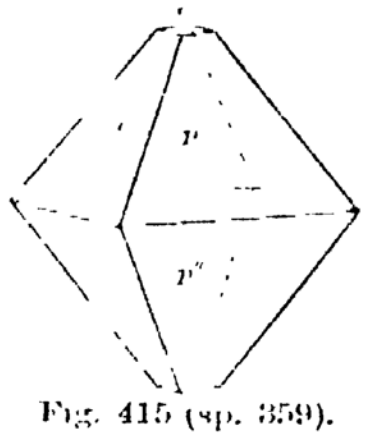

Fig. 415 (sp. 359).

MEGABASITE, Mg_2W_3.

...que prismatic; similar to wolframite. ...needles. H. = 3·5 to 4; G. = 6·45 to ... Vitreous to adamantine. Yellowish ...to brownish red, translucent hyacinth... ...treak ochre-yellow. C.e.: protoxide ...nganese 23·1, protoxide of iron 5·4, ...c acid 71·5. Schlaggenwald, Sadis ...Jorococha in Peru.

SCHEELITE, CaW.

...nidal; with many of the modifying planes hemihedric. P ...2′. Cl. 2P∞ (*n*) 130° 33′, perfect; P and oP less so. Frac... ...onchoidal. H. = 4 to 4·5; G. = 5·9 to 6·2. Translucent; ...s to adamantine. Colourless, and grey, yellow, or brown; ...white. C.e.: 19·4 lime, 80·6 tungstic acid. Caldbeckfell near Keswick, Pengelly in Cornwall, Zinnwald, Schlaggenwald ... burg, Chili, Si... beria, Connecti... cut. Employed for the extrac... tion of yellow tungstic acid, a fine pigment.

362. STOLZ ...ITE, PbW ... Pyramidal, generally hemihedric. P ... 31° 25′. Crystals sometimes spindle-... shaped. Cl. P, imperfect. H. = 3, G. = ... 9 to 8·1. Translucent, resinous. Grey, ... yellow, brown. C.e.: 48·1 protoxide of ... lead, 51·6 tungstic acid. Keswick, Zinn... wald, Coquimbo (Brazil).

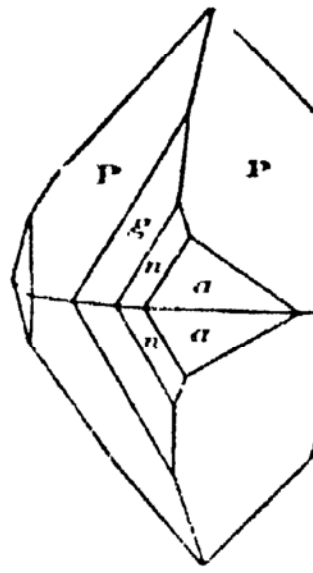

Fig. 417 (sp. 3

363. REINITE, FeW.

Pyramidal. P 103° 32′; basal angle 122° 8′. Cl. ... P. G. = 6·64. C.e.: protoxide of iron 23·1, tungstic acid ... Kimbosan in Japan.

364. WOLFRAMITE, (Fe, Mn)W.

Oblique prismatic, C 89° 22′. P : *M* = 100° 37′, −P ... 61° 0½′, P∞ : ∞P 98° 6′, ∞P∞ : ∞P∞ = 94°2′ 30″, − ... 32°2′ 30″. Twins common. Also laminar ... Cl. clinodiagonal, perfect; fracture un... even. H. = 5 to 5·5, G. = 7·1 to 7·5. ... Opaque, resinous, metallic, adamantine ... on the cleavage. Brownish black, ... streak black (varieties with most iron to ... reddish brown (most manganese). C.e.: ... 76 tungstic acid, 9·5 to 20 protoxide of ... iron, and 4 to 15 protoxide of manganese, ... in some with 1·1 niobic acid. East ... Pool, Cambrae, and mines near Redruth; ... Godolphin's Ball in Cumberland, Alten... berg, Geyer, Ehrentriedersdorf, Schlag... genwald, Zinnwald, the Harz, also ... Urals, Ceylon, and North America.

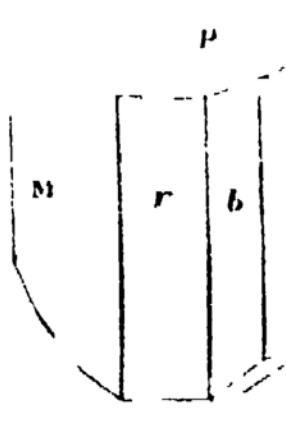

Fig. 418

Hübnerite, with 26 protoxide of iron ... and 2FeW + Fe (H. = 4 to 4·5, G. = 6·7 to 6·8), from Spain, ... different.

365. HÜBNERITE, MnW.

Right prismatic. ∞P (*M* : *M*) 105°. Cl. ∞P∞, ... usually foliated or columnar. H. = 4·5, G. = 7·14. Adama... cleavage; elsewhere greasy. Brown-red, streak yellow... C.e.: protoxide of manganese 23·4, tungstic acid 76·6. M... district in Nevada.

ANHYDROUS PHOSPHATES, ARSENIATES, AN... VANADIATES.

366. XENOTIME, Y_2P.

Pyramidal. P 87° 22′. Mid. angle, polar angle 1... Crystals P; ∞P∞ : ∞P. Cl. ∞P∞, ...

Fig. 419 (sp.

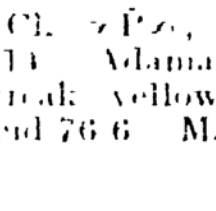

Fig. 420 (sp

H. = 4·5; G. = 4·6 to 4·55. Translucent ... in thin splinters, resinous. Yellowish ... and flesh-red. C.e.: 62 yttria, and 38 ... phosphoric acid, but some with 8 to 11 ... cerium protoxide. Lindesnäs and Hit... tero in Norway, Ytterby (Sweden), ... Georgia, and (*B*...) St Gotthard.

367. CRYPTOLITE, Ce_2P.

Acicular crystals, imbedded in apatite. ... G. = 4·6. Translucent. Pale wine-yellow. ... s acid. Wöhler found 73·70 cerium protoxide, 27·37 ph... acid, and 1·51 iron protoxide. Occurs in ... the apatites of granite in Scotland, but not ... in those of lime-stone. Also at Arendal.

368. MONAZITE, $(Ce, La, Th)_2P$.

Oblique prismatic, C 76° 13′. ∞P 93° ... 23′; crystals (fig. 120) generally thick or ... tabular. Cl. basal, perfect; translucent on ... edges. Flesh-red and reddish brown. C.e.: ... 28 phosphoric acid, 37 to 46 cerium prot... oxide, 24 to 27 lanthanum oxide; that f... Zlatoust from 18 to 32·5 of thoria. Näs... in Norway, Miask, Norwich in Connecticut, and the Rio ... Colombia. *Turnerite*, from Dauphiné, in complex tra... honey-yellow crystals, is monazite.

RRHYLLITE, $(2\dot{F}e, Li_2)\ddot{P}$
orismatic. ∞P 13…, chiefly granular. H. 5; G. 3·6.
Greenish grey with blue spots. C.c., iron protoxide 40, …e protoxide 2·0, lithia 7·5, phosphoric acid 45. Boden-Bavaria. Norwich in Massachusetts. *Lithophilite*, from …Compositions is a mixture of triplite.

…RITE. *Kobell*, $(CaMg)_3As$…
… H. 5·5 to 6, G. 2·95. C.c.: lime 23, magnesia 15, …id 50·5. Dalecarlia (Sweden).

…STALLITE or NICKEL, Ni_3A…
…ous. H. 4, G. 4·9. Sulphur-yellow. C.c., oxide of …, or … acid 50·5. Johann-Georgenstadt.

…CHITE, Ni_3A… $2N$…
…line to massive. G. 4·4. Dark cabbage-green, streak lighter …en inclined to grey. C.c., arsenic acid 36·0. Johann-Georgenstadt.

…ITE. $(Pb, Zn)_3V_2$…
…dal and cubic (the). H. 3 to 4. G. 5·0–9. Lustre …resinous. Yellowish red, deep red, brownish orange to pale …C.c., oxide of lead, 15·5 oxide of zinc, 21·2 of vanadic …Hochkönig, Freiburg, Baden, Lauter Valley.

…ITE. $3Pb_3V_2 + Cu_3V_2 + 6CuH$…
…ellow and massive. H. 4. G. 6·0. C.c., oxide of lead 53·2, copper oxide 18·95, water 8·58 …(Montan).

…ITE, B_2A…
…rismatic. ∞P 123° 56′. H. 4, G. 6·25. Cleavage, per… Red or reddish brown, streak yellow. Easily soluble …C.c., bismuth oxide 74·7, vanadic acid 25·3. Schneeberg.

…ITE, Ca_3Sb…
…ic. ∞P 90 with 96 and 33. H. 5·5 to 6. G. 5. Lustre …adamantine. Yellow to reddish brown. Translucent. C.c., antimonic acid …47·5, iron protoxide 2·7, manganese protoxide 1·0, lime 48·8. Långbanshyttan.

HYDROUS PHOSPHATES, &c.

…ITE, $(CaCu)_3PH_2P_2O_{11}$…
…prismatic. ∞P 68° 45′. Needle crystals. H. 2 to 2·5. …Vitreous. C.c., lime 32·6, phosphoric acid 41·3, water …Island and Sombrero (Antilles).

…WELLYITE, $MeAlH_4P_2O_{11}$…
…rismatic. Cl. brachydiagonal. C.c., phosphoric acid 41·2, …2, water 35·7. From lime, Skiptor Cave, Victoria.

…ARSENIATE, $Co_3As_2O_8 + 3H_2O$…
…prismatic. ∞P 100°. Cl. perfect, …ectile, flexible. …2·0. G. 2·5 to 2·9. Otherwise like phosphocobaltite. C.p. …85·6 arsenate of lime, 14·2 water.

…ITE, $B_2A_2 + 2H_2O$…
…Cl. monoclinodiagonal. Rose-red, streak white. H. …3·46. C.c., 25·5 lime, 10·3 cobalt oxide, 3·0 magnesia, …ic acid, 8·2 water. Schneeberg.

…ARMACOLITE. $2CaAs_2O_4 + 6H_2O$…
…prismatic. ∞P 65° 1′ (fig. 120). $\infty P\infty$ (*a*), ∞P (*m*), $P\infty$ …(*r*), $\frac{1}{2}P\infty$ (*o*), $\frac{1}{3}P\infty$ (*d*), $2P\infty$ (*e*), $3P\infty$ (*f*), $\infty P3$ (*g*), Heterozite. H. = 5; G. = 3·5. Opaque; vitreous or resinous. Dark violet or blue to greenish grey; streak violet-blue or crimson-red. Contains more iron and less manganese than the above. Hureaux.

392. Dickinsonite, $4(\dot{R}_3\ddot{P}_2)+3\dot{H}_2$.

Oblique prismatic, C 60° 30′. Crystals tabular. Cl. basal, perfect. H. = 3·5 to 4; G. = 3·31. Vitreous; pearly on cleavage. Olive- to oil-green, and grass-green; streak white. Transparent; brittle. C.c.: phosphoric acid 40, iron protoxide 12·7, manganese protoxide 25, lime 11·8, soda 6·6, water 3·8. Branchville (Connecticut).

393. Triplogidite, $(\dot{M}n, \dot{F}e)_3\ddot{P}_2+\dot{H}_2(\dot{M}n, Fe)_2$.

Oblique prismatic, C 51° 56′. Generally fibrous; transparent resinous to adamantine. H. = 4·5 to 5; G. = 3·7. Yellowish brown. C.c. 48·15 oxide of manganese, 14·88 protoxide of iron, 32·4 phosphoric acid, 4·1 water. Fairfield (Connecticut).

394. Fairfieldite, $\dot{R}_3\ddot{P}_2+2\dot{H}_2$.

Anorthic; usually foliaceous. H. = 3·5; G. = 3·15. White to straw-yellow; streak white. Pearly to brilliant-adamantine on cleavage. Transparent; brittle. C.c. phosphoric acid 38·4, iron protoxide 5·6, manganese protoxide 15·6, lime 30, soda 7, water 10. Fairfield (Connecticut).

395. Chondrarsenite, $\dot{M}n_3\ddot{A}s_2+2\dot{H}_2$.

In small grains. H. = 3. Yellow to reddish-yellow. Translucent; brittle; fracture conchoidal. Parsberg mines (Wermland).

396. Reddingite, $\dot{M}n_3\ddot{P}_2+3\dot{H}_2$.

Right prismatic. P; ∞P2; ∞P∞. H. = 3 to 3·5; G. = 3·1. Vitreous; rose-pink to yellowish white. Translucent; fracture uneven; brittle. C.c.: phosphoric acid 34·5, iron protoxide 5·43, manganese protoxide 46·3, lime 8, water 13·1. Branchville.

397. Scorodite, $\dot{F}e_2\ddot{A}s_2+4\dot{H}_2$.

Right prismatic. P with polar edges 102° 52′ and 114° 10′. Crystals P (*p*), ∞P∞ (*a*), and ∞P∞ (*b*); also 0P, ½P (*c*), ∞P (*o*), 2P2 (*s*), ∞P2 (*d*, 120° 10′, and 2P∞ (*m*) 132° (fig. 427), also columnar and fibrous. Cl. imperfect; brittle. H. = 3·5 to 4; G. = 3·1 to 3·2. Translucent; vitreous. Leek-green to greenish black, also indigo-blue, red, and brown. B.B. fuses easily, with arsenical odour, to a grey magnetic slag. Sol. in h. acid, to a brown solution. C.c.: 49·8 arsenic acid, 34·6 iron peroxide, and 15·6 water. St Austell in Cornwall, near Limoges in France, Schwarzenberg, Lölling in Carinthia, Brazil, and Siberia.

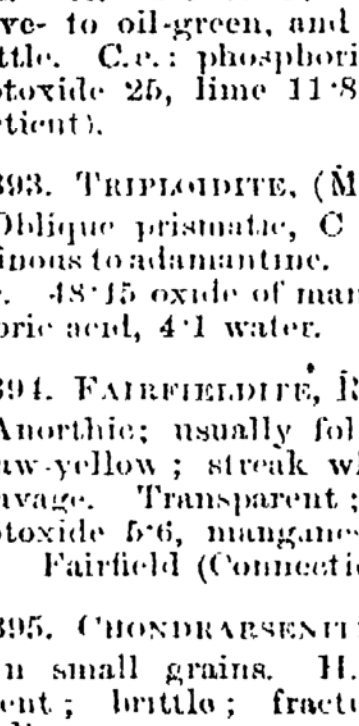

Fig. 427 (sp. 397).

398. Strengite, $Fe_2\ddot{P}_2+4\dot{H}_2$.

Right prismatic. P with polar edges 101° 38′ and 115° 36′, middle edge 111° 30′. ∞P2 (*d*) and ∞P∞ (*r*), P (*P*), 0P (*h*), 2P∞ (*m*) 48° (fig. 428). Crystals generally *r*, *P*, *d*, *r* dominant. Cl. *r*. H. = 3 to 4; G. = 2·87. Cherry-red. Translucent. C.c.: protoxide of iron 43·18, phosphoric acid 37·42, water 19·4. Rock Bridge (Virginia).

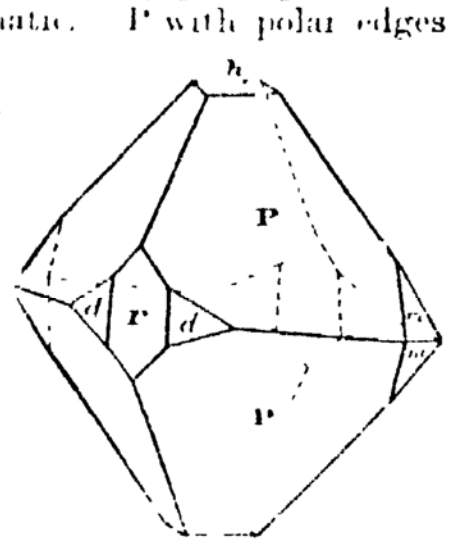

Fig. 428 (sp. 398).

399. Dufrenite (*Kraurite*), $2Fe_2\ddot{P}_2+3\dot{H}_2$.

Right prismatic. ∞P about 123°. Spherical or reniform. Cl. brachydiagonal; brittle. H. = 3 to 3·5; G. = 3·3 to 3·4. Translucent on the edges, or opaque; shining or dull. Dirty leek-green or blackish green; streak siskin-green. C.c.: 63 iron peroxide, 28 phosphoric acid, and 9 water. Westerwald, Hirschberg, and Limoges.

400. Beraunite, $5\dot{F}e_2\ddot{P}_2+14\dot{H}_2$.

Occurs in small foliated and columnar aggregates. Cl. plane metallic pearly. H. = 2; G. = 2·878. Colour hyacinth-red to reddish brown; streak dirty-yellow. C.c.: 51·5 peroxide of iron, 28·65 phosphoric acid, and 16·55 water. Bohemia, Scheibenberg in Saxony.

401. Eleonorite, $3Fe_2\ddot{P}_2+8\dot{H}_2$.

Oblique prismatic, C 48° 33′. Twin face the ortho. Cl. ∞P∞. H. = 3 to 4. Dark hyacinth-red; streak. Vitreous to pearly. C.c.: 51·91 peroxide of iron, 31·88 phosphoric acid, 16·37 water. Eleonore mine near Bieber.

402. Cacoxene, $2Fe_2\ddot{P}_2+12\dot{H}_2$.

Radiated tufts, of a brownish-yellow colour. H. = 3. G. = 2·38. Sol. in h. acid. From the Hrbeck mine near Z. Bohemia.

403. Pharmacosiderite (*Cube Ore*), $4Fe_2\ddot{A}s_2+15\dot{H}_2$.

Cubic and tetrahedral; usually ∞O∞, with $\frac{O}{2}$, or ∞O. H. = 2·5; G. = 2·9 to 3. Cl. ∞O∞. Semitransparent to faint, adamantine or resinous. Olive- to emerald-green, yellow, and brown; streak straw-yellow. Pyrognostic. C.c.: arsenic acid, 40 iron peroxide, and 17 water. Carharrack, Gwennap, Tincroft, Huel Unity, Huel Gorland, Huel Gawn, Huel Basset, Huel Alfred, Huel Seton, Huel Damsel, Huel Hope, Huel Crofty, Huel Vor, Huel Trumpet, Huel Rose, Huel Unity Wood, Huel Peever, Huel Providence, Huel Fortune, Huel Grenville, Huel Mexico, Huel Sparnon, Huel Fanny, Huel Jane, Huel Agar, Huel Virgin, Huel Vincent, Huel Rock, Huel Basset Downs, Huel Penhale, Huel Bassick, Huel Bassick Downs, Huel Bassick Vean, Huel Bassick Wood, Huel Bassick Moor, Huel Bassick Hill, Huel Bassick Valley, Huel Bassick Common, Huel Bassick Green, Huel Bassick Lane, Huel Bassick Road, Huel Bassick Bridge, Huel Bassick Farm, Huel Bassick Cottage, Huel Bassick House, Huel Bassick Mill, Huel Bassick Church, Huel Bassick School, Huel Bassick Chapel, Huel Bassick Inn, Huel Bassick Post Office, Huel Bassick Station, Huel Bassick Wharf, Huel Bassick Quay, Huel Bassick Harbour, Huel Bassick Pier, Huel Bassick Lighthouse, Huel Bassick Beacon, Huel Bassick Buoy, Huel Bassick Anchorage, Huel Bassick Roadstead, Huel Bassick Bay, Huel Bassick Creek, Huel Bassick River, Huel Bassick Estuary, Huel Bassick Delta, Huel Bassick Mouth, Huel Bassick Source, Huel Bassick Tributary, Huel Bassick Confluence, Huel Bassick Basin, Huel Bassick Watershed, Huel Bassick Divide, Huel Bassick Ridge, Huel Bassick Valley, Huel Bassick Plain, Huel Bassick Hill, Huel Bassick Mountain, Huel Bassick Peak, Huel Bassick Summit, Huel Bassick Slope, Huel Bassick Foothill, Huel Bassick Piedmont, Huel Bassick Coastal Plain, Huel Bassick Continental Shelf, Huel Bassick Continental Slope, Huel Bassick Continental Rise, Huel Bassick Abyssal Plain, Huel Bassick Trench, Huel Bassick Ridge, Huel Bassick Seamount, Huel Bassick Guyot, Huel Bassick Atoll, Huel Bassick Reef, Huel Bassick Island, Huel Bassick Archipelago, Huel Bassick Peninsula, Huel Bassick Isthmus, Huel Bassick Cape, Huel Bassick Bay, Huel Bassick Gulf, Huel Bassick Strait, Huel Bassick Channel, Huel Bassick Sound, Huel Bassick Inlet, Huel Bassick Lagoon, Huel Bassick Marsh, Huel Bassick Swamp, Huel Bassick Bog, Huel Bassick Fen, Huel Bassick Moor, Huel Bassick Heath, Huel Bassick Down

OLIVENITE, $4Cu^{\cdot}AsO_4 + H_2$

t prismatic. ∞P, ∞ 99° 30′, $P\infty$ (*i*) 110° 50′, $\infty P\infty$ (*a*) 1), also spheroidal mammiform, and ar or fibrous. Cl. $\infty P\infty$ and $P\infty$, im- H. 3; G. 4·1 to 4·6. Pellucid egrees, vitreous, to adamantine or silky olive, or dark leek-green, also yellow wn, streak olive-green or brown the former true, the latter to a dark a tinge of the lead, covered with on charcoal deflagrates, arsenical vapours, and is reduced. acid and ammonia. Cornwall, 65·5 oxide of copper, 29·5 arsenic acid, and 4 But also 1·1 to 6 phosphoric acid ck, Lis Croft, Gwennap, and St ervale, Wheal Moor, Thuringia Stolberg Clubs

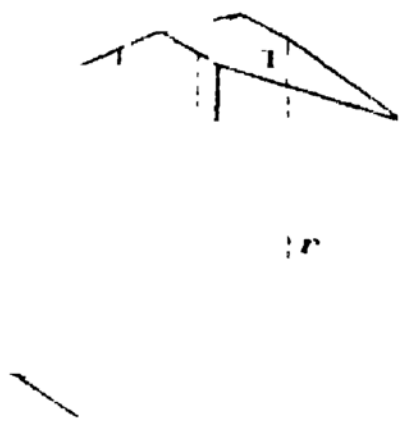

Fig. 431.

VANOXITE, $9Cu, 6Zn, P_2, As_2, 18H$

ne prismatic. C. 103° 50′. H. 3·5 to 4. G. 3·53. Green Cornwall, copper 37·34, 25·20 zinc oxide, 10·41 arsenic acid, sphoric acid, 17·05 water. Moravicza (Banat).

DESCLOIZITE, $2PbV_2 + H_2$.

prismatic. ∞P 116° 25′. H. 3·5. G. 5·86 to 6·1. own to black. Cornwall, 56·13 oxide of lead, 10·6 oxide of zinc, le of manganese, 22·74 vanadic acid. Sierra de Cordoba rgentine Republic.

VOLBORTHITE, $4Cu, Ca, V_2 + H$.

gonal, small tabular crystals. $0P$, ∞P, single or in groups y more or less. H. 3; G. 3·45 to 3·89. Olive-green, almost yellow. B.B. on charcoal fuses easily and forms a like slag, contaminated with traces of copper. Sol. in nitric acid, and ter gives a dark red precipitate. Cornwall, 37 to 38 vanadic 1 to 16 copper oxide, 18·5 to 13 lime, 3·6 to 5 water. Urals, Nijni-Tagilsk, and Friedrichroda in Thuringia.

EVANSITE, $4CuP + 3H_2$.

ne prismatic, but botryoidal and radiating globular masses, or H. 3, G. 4. Emerald-green. Cornwall, 61·7 copper prot- 7·7 phosphoric acid, and 10·5 water. Nijni-Tagilsk, and schberg.

EUCHROITE, $4CuA + 7H$

prismatic. ∞P (M) 117° 20′, $P\infty$ (o) 106° 52′ with $\infty P2$ $0P$ (P) (fig. 432). Brittle. H. 3·5 3·5 to 3·4. Translucent to opaque, vitreous merald or leek-green, streak verd- green. B.B. in forceps fuses to brown crystallised mass. Dis- n acid. Cornwall, 47 copper protoxide, ne acid, and 13 water. Libethen in

Fig. 432 (p. 417).

EUNITE, $5Cu^{\cdot}As_2 + 2H$.

orm and foliated, conchoidal fracture. to 5. G. 4 to 4·1. Translucent on -, dull resinous. Emerald or grass-green, streak similar 9 copper protoxide, 34·7 arsenic acid, and 5·4 water l. *Cornwallite* has 3 or 5 of water.

DIHYDRITE, $5CuP + 2H$.

4. Oxide of copper 63, phosphoric acid 24·7, water 6·25 Libethen and Nijni-Tagilsk.

MELANOCHALCITE, $5Cu, Pb, V + 2H_2$.

Green crusts, streak yellow. H. 3; G. 4·9 oxide of copper 20·4, oxide of lead 7·2, vanadic acid 18·4 Mexico or Cornwall.

LINARITE, $5PbS + H$

pris- oblique, radiating, foliated. H. 1·5 to 2, to 4·7. Translucent on the edges, pearly on the cleavage is green, streak pale. Cornwall, 67 copper protoxide, 24 ric acid, and 9 water. Eisl on the Rhine, Nijni-Tagilsk, n.

PYROMORPHITE, $5PbAs + 2H$.

prismatic. Cl. basal perfect. Botryoidal. Radiate-foliated. H. 1·5 to 2; G. 6·9. Lustre pearly on cleavage face. Colour en and verdigris-green to lavender-blue; streak paler. Sub nt. Cornwall, oxide of copper 5·6, arsenic acid 29·2, water Tyrol, Hesse, Thuringia.

PSEUDO-PHOSPHOCHALCITE (*Libethenite*), $6CuP_2 + 3H_2$.

ne prismatic. Crystals $\infty P2$ (I) 98° 56′, P (Pi) 117° 49′, with $0P$ (a) and $\infty P\infty$ (c) (fig. 433); usually small and in more common in spherical or reniform and radiated-fibrous masses. H. 5; G. = 4·1 to 4·3. Translucent throughout or on the edges; adamantine to resinous. Blackish-, emerald-, or verdigris-green. Cornwall, 70·8 copper protoxide, 21·2 phosphoric acid, and 8 water. Cornwall, Rheinbretenbach, Nijni-Tagilsk.

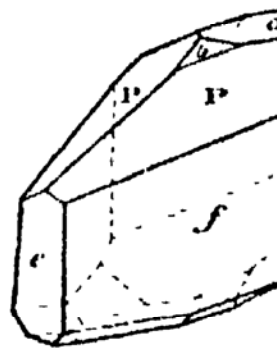

Fig. 433 (sp.

124. CLINOCHALCITE, $6CuA_2 + 3H_2$.

Oblique prismatic. C. 80° 30′. $0P$ (P), ∞P (m) 56°, $^1P\infty$ (o) 99° 30′, (r) 123° 48′ (figs. 434, 435), and hemispherical. Cl. basal, perfect. H. 2·5 to 3. G. = 4·2 to 4·4. ous pearly on cl. Dark verdigris-green to sky-blue; streak blue. Cornwall, 62·6 copper protoxide, 30·3 arsenic acid, 7·1 water. Cornwall, Tavistock, Devonshire.

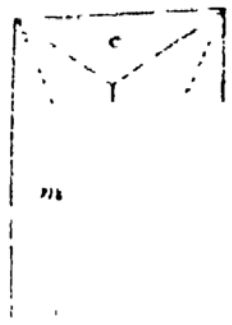

Fig. 434 (sp. 421). Fig. 435 (sp.

125. MIXITE.

Oblique prismatic or anorthic (?). Radiating, centrally granular. ∞P 125° H. 3 to 4, G. 2·66. Lime- dull-green to blue-green, streak paler. Cornwall, 43·21 copper oxide, 13·1 bismuth oxide, 30·45 arsenic acid, 11·1 water. Geistergang, Joach

126. RHAGITE, $5Bi_2O_3, 2As_2O_5 + 8H_2O$.

Grape-like groups of minute crystals. Colour yellowish streak white. Lustre waxlike. Brittle. H. = 5, G. = 6·8 bismuth oxide 79·5, arsenic acid 15·6, water 4·9. Ne near Schneeberg.

127. TROGKRITE, $3UAs_2 + 12H_2$.

Oblique prismatic, C. 80°. Crystals thin tabular. C diagonal, perfect. Lustre pearly. G. = 3·3. Lemon-yellow 65·95 oxide of uranium, 17·56 arsenic acid, 16·49 water. tube gives off water, and becomes golden brown, but again on cooling. Neustadtel.

128. SIDERITE, $(NH_4, 2Mg)P_2 + 12H_2$.

Right prismatic. $\bar{P}\infty$ (o) 63° 7′, $P\infty$ (e) 95°, $4\breve{P}\infty$ (b) $\infty P\infty$ (m), $\frac{1}{2}P\infty$ (m) 123°, $0P$ (a) (fig. 436). Cl. brachydiagonal, perfect. H. 1·5 to 2, G. 1·66 to 1·75. Trans- parent or opaque, vitreous. Colourless, but yellow or brown. Cornwall, 29·9 phos- phoric acid, 16·3 magnesia, 10·6 am- monia, and 44 water. Under St Nicholas church at Hamburg, and in guano from South America.

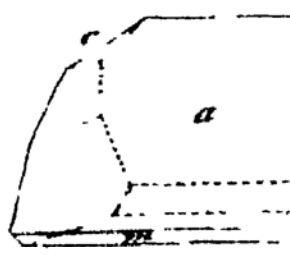

Fig. 436.

129. ARSENIOSIDERITE, $3CaAs_2 + 3Fe_2As_2 + 6H_2$.

Spherical and fibrous, friable. H. = 1·2; G. = 3·52 t Opaque, silky. Golden yellowish brown, streak yellowish peroxide of iron 39·4, lime 13·8, arsenic acid 37·9, w Romanèche near Macon.

130. CHALCOSIDERITE.

Anorthic. Light green crysta G. = 3·11. C.c.: 4 oxide of iron, 8·4 oxide of copper, 4·45 alumina, 30·54 phosphoric acid, 15 water. Cornwall.

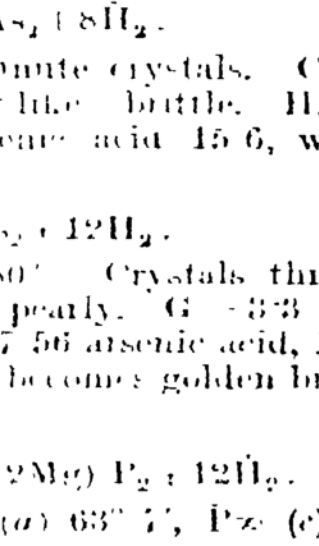

Fig. 437 (sp. 431).

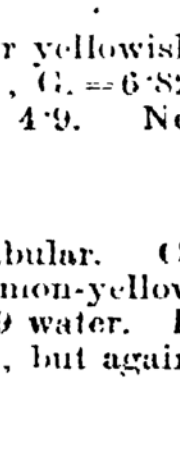

Fig. 438 (

431. LAZULITE, Al_2P_2

$+ (Mg, Fe)_3P_2 + 2H$.

Oblique prismatic, C. 98° 2′. ∞P 90° 33′, $P\infty$ 99° 40′. -1 (p) 100° 20′. Crystals often tabular through distortion, twins on $0P$, and $\infty P\infty$; also massive, in fine splint- ery. Cl. ∞P. H. = 5 to 6; G. = 3 to 3·1. Trans- lucent; vitreous. Indigo- and smalt-blue to greenish white. In closed tube yields water, and loses colour. So acids after ignition. C.c.: 31·7 alumina, 10 magnesia, oxide of iron, 44 phosphoric acid, and 6 water. Salzburg Brazil, Georgia, Lincoln in North Carolina.

HILDRENITE, $2(Fe, Mn)_4\dot{P} + Al\dot{P} + 15\dot{H}$. P—P$_\infty$H H$_2$&c.
prismatic. Polar edges 101° 43′, 130° 10′, middle 98° 44′,
orm $\breve{P}$, $2\breve{P}\infty$, $\infty P\infty$ (e, a, P, fig. 139).
to 5; G. = 3·18 to 3·3. Translucent;
. Yellowish white to wine- or ochre-yellow,
r almost black. C.c.: 30·7 iron protoxide,
nese protoxide, 11·5 alumina, 29 phos-
cid, and 17 water. Tavistock, Crinnis
ington (Cornwall).

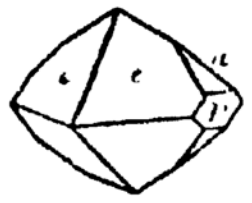

Fig. 439.

OSPHORITE, $(Fe, Mn)_3\dot{A}l_2\dot{P} + 4\dot{H}$.
prismatic. P (p) 133° 32′ and 118° 56′; ∞P (r) 104° 12′,
), $\infty P\infty$ (b), $\infty P2$ (q), $\frac{1}{2}\breve{P}_2$ (q), $2\breve{P}2$ (s) (polar edge 130° 26′
42′) (fig. 440). Cl. macro-
. H. = 5, G. = 3·13. Pale
itreous. C.c.: 22 alumina,
oxide of iron, 23·5 oxide of
ese, 31·5 phosphoric acid,
ter. Fairfield (Connecticut).

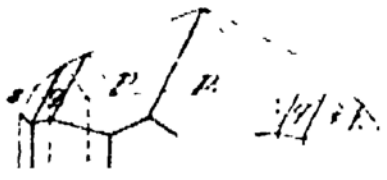

Fig. 440.

LIROCONITE, $Cu_3\dot{A}s_2 + Al\dot{A}s$

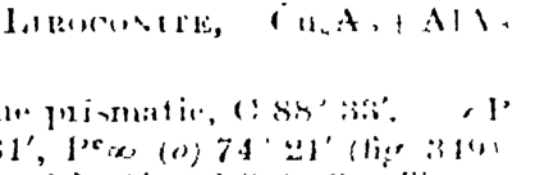

Fig. 442.

ne prismatic, C 88° 33′. ∞P
31′, P^{∞} (o) 74° 21′ (fig. 319)
o 2·5; G. = 2·8 to 3. Trans
vitreous or resinous. Azure
verdigris green; streak paler
·6 protoxide of copper, 11·9
, 26·6 arsenic acid, 21·9 water. Redruth, Herrengrund
gary.

Fig. 443.

HALCOPHYLLITE, $Cu_9\dot{A}s_2 + 12\dot{H}$.
gonal rhombohedral; R 69° 48′ (fig. 141). Cl. basal, perfect;
H. = 2; G. = 2·4 to 2·6.
rent; vitreous to adamantine
n 0R (o). Emerald to gras
gris green; streak pale gr
n acids and ammonia. C.c
e of copper 49·6, arsenic acid 18, water 32·4. Redruth
wall, Saida in Saxony, Moldawa in the Banat.

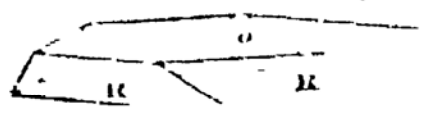

Fig. 444.

RANITE, $(Ca, \overset{\cdot\cdot}{U}_2)\dot{P} + 8\dot{H}$.
prismatic. ∞P 90° 43′, P middle edge 127° 32′, 0P : P
0P : $2\breve{P}\infty$ 109° 6′; 0P : $2\breve{P}\infty$ 109° 19′ (fig. 444). Crys
. Cl. basal, perfect; sectile. H. =
- 3 to 3·2. Translucent, pearly on
lphur-yellow to siskin-green, streak
. C.c.: 15·5 phosphoric acid, 62·6
peroxide, 6·1 lime, and 15·8 water.

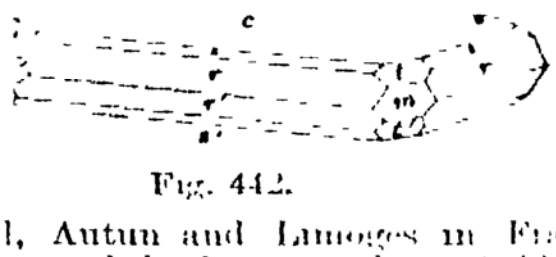

Fig. 445.

Fig. 446.

l, Autun and Limoges in France, Johann Georgenstadt
enstock in Saxony, Chesterfield in Massachusetts.

RANOSPINITE, $(Ca, \overset{\cdot\cdot}{U}_2)\dot{A}s + 8\dot{H}$.
prismatic; quadrangular, scale-like crystals. Cl. basal,
H. = 2·3; G. = 3·45. Siskin-green. C.c.: lime 9·47, sesqui-
uranium 59·18, arsenic acid 19·37, water 16·29. Neu

RANOCHRCITE, $(Ba, \overset{\cdot\cdot}{U}_2)\dot{P} + 8\dot{H}$.
wish green crystals, isomorphous with 437. Cl. basal.
3. C.c.: sesquioxide of uranium 56·86, baryta 14·57, phos
cid 15·71, water 14. Falkenstein in Voigtland.

HALCOLITE, $(Cu, \overset{\cdot\cdot}{U}_2)\dot{P} + 8\dot{H}$.
nidal. P middle edge 142° 8′; $P\infty$ 128° 14′. Crystals
$\infty P\infty$, $P\infty$. Cl. basal, perfect; pearly lustre, brittle.
to 2·5; G. = 3·5 to 3·6. Grass- to emerald or verdigris-
streak apple-green. C.c.: 15·2 phosphoric acid, 6·1
peroxide, 8·5 copper protoxide, and 15·3 water. Red-
d St. Austell, Johann-Georgenstadt, Eibenstock, Schneeberg
ais, Baltimore.

EUNERITE, $(Cu, \overset{\cdot\cdot}{U}_2)\dot{A}s + 8\dot{H}$.
ndal. P middle edge 142° 6′. 0P : P 109° 57′. Crystals
Cl. basal. H. = 2·5; G. = 3·53. Grass-green. Lustre
C.c.: 7·7 oxide of copper, 55·95 sesquioxide of uranium, 14
Huel Gorland in Cornwall, Neustadtel, Joachimsthal,
d, Wittichen.

441. WALPURGITE, $5Bi\dot{A}s + 3\overset{\cdot\cdot}{U}\dot{A}s + 10\dot{H}$.
Anorthic; in scaly crystals. Wax-yellow to pomegra
Adamantine to greasy. H. = 3·5; G. = 5·76. C.c.: sesquo
bismuth 60·4, sesquioxide of uranium 20·4, arsenic acid 1
1·5. Neustadtel.

442. PLOMBGOMME, $Pb_3\dot{P} + 6A\dot{H}_3$.
Reniform or stalactitic; fracture conchoidal and splintery
1 to 1·5; G. = 6·3 to 6·4. Translucent, resinous. Yello
greenish white to reddish brown. C.c.: 38 protoxide of l
dumina, 8 phosphoric acid, and 19 water; but with 2 chlo
lead. Poullaouen, Nussloch near Bampen, Georgia.

COMPOUNDS OF PHOSPHATES, VANADIATES, AND ARSENI
WITH HALOID SALTS.

443. APATITE, $3Ca\dot{P} + Ca(Cl, F)$.
Hexagonal and pyramidal-hemihedric. P 80° 26′. Th
common forms are ∞P (M); $\infty P2$ (a), $0P$ (m). P (x, the
seldom wanting (figs. 92, 95, 96, 97, 98). The crystals ar
prismatic or thick-tabular; also granular, fibrous, o
part. Fracture conchoidal or splintery; brittle.
G. = 3·1 to 3·25. Transparent to opaque, vitreous to r
Colourless and white, but generally light green, grey
violet, or red. C.c.: phosphate of lime 89 to 92·3
chloride (to 11) or fluoride (to 7 %) of calcium, or both. I
nated in granite, gneiss, mica and hornblende slates,
lime-stones, and trap rocks, also in beds and vein. Suth
Ross, and Aberdeen, in granite and limestone, Cumb
Devonshire, and Cornwall, in tin-mines in Saxony, Be
St Gotthard, Tyrol; Kragero in Norway, New York, Canad

444. PYROMORPHITE, $3Pb_3\dot{P} + PbCl$.
Hexagonal, P 80° 44′. Crystals ∞P, 0P, with $\infty P2$, or $P($
fig. 444), occasionally thicker in the middle, or spindle-
also reniform or botryoidal; fracture conchoidal or un
even. H. = 3·5 to 4, G. = 6·9 to 7. Translucent, resin
ous or vitreous. Colourless, but generally grass-, pis
tachio-, olive-, or siskin-green, and clove- or hair-brown,
and scarlet (Leadhills). C.c.: 89·7 phosphate and l
10·3 chloride of lead, but with 0 to 9 arseniate of
lead, 0 to 11 phosphate of lime, and 0 to 1 fluoride of
calcium. Elgin, Wanlockhead, also Cornwall, Derby
shire, Yorkshire, Durham, Cumberland, Wicklow; F
Przibram, Mies, and Ehrenfriedersdorf in Bohemia; Berezoff, Pho
in Pennsylvania, and Mexico.

445. VANADINITE, $3Pb_3\dot{V} + PbCl$.
Hexagonal, P 78° 46′. Forms: ∞P, 0P (o), P (x), 2P, $\frac{1}{2}P(\frac{1}{2}$
∞P, $2\breve{P}2$ (fig. 445). Transparent to
opaque, resinous. Honey-yellow to
greyish brown, streak white. H. = 3,
G. = 6·8 to 7·1. C.c.: oxide of lead 70·5
vanadic acid 19·35, lead 7·2, chlorine
2·62. Wanlockhead, Windischkappel
in Carinthia, Haldenwirth house in
the Black Forest, Bolet in West Got
land, Berezovsk, Zimapan in Mexico,
Cordoba in the Argentine Republic.

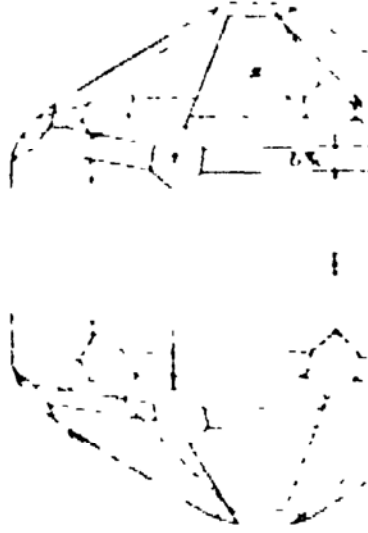

Fig. 446 (p. 44

446. MIMETESITE, $3Pb_3\dot{A}s + PbCl$.
Hexagonal, P 81° 1′. Crystal
∞P, 0P, P (figs. 91, 141), or P, 0P
Cl. P, fracture conchoidal or uneven.
H. = 3·5 to 4; G. = 7·19 to 7·25.
Translucent. Colourless, but usually
honey- or wax-yellow, yellowish green
or grey. C.c.: 90·7 arseniate and
9·3 chloride of lead, but part of the arsenic occasionally rep
phosphoric acid. Leadhills, Huel Alfred and Huel Unity
wall, Roughten Gill and Dry Gill in Cumberland, Beer
Devonshire, Johann Georgenstadt, Zschorlau, Badenwe
Pen in France, Nertschinsk, and Zacatecas in Mexico.

447. WAGNERITE, $Mg_3\dot{P} + MgF$.
Oblique prismatic, C 63° 25′. ∞P 57° 35′. Cl. prism
orthodiagonal imperfect; fracture conchoidal or splintery
to 5·5. G. = 3 to 3·2. Translucent or transparent; resinou
yellow and white. C.c.: 43·3 phosphoric acid, 11·4 fluor
magnesium and 7·7 magnesium; but with 3 to 4·5 iron p
and 1 to 4 lime. Werfen in Salzburg.

448. TRIPLITE, $(Fe, Mn)_3\dot{P} + RF$.
Oblique prismatic; only granular. Cl. in two direc
right angles; fracture conchoidal. H. = 5 to 5·5. G. = 3·
Translucent or opaque; resinous. Chestnut- or blackish
streak yellowish grey. C.c.: iron and manganese protoxid
33 phosphoric acid, and 7 or 8 fluorine. Limoges, Schlagg

ZWIESELITE, (Fe, Mn)$_3$P$_2$ + FeF$_2$.

prismatic, but rarely massive. Cl basal, perfect. H. = 4·5 G. = 3·95 to 4. Brown, streak yellow. Occurs like triplite. in Bavaria.

AMBLYGONITE. Al$_2$P$_2$O$_8$ + (Li, Na)$_2$P$_2$O$_8$ + AlF$_3$ + (Li, Na)F.

blue; crystalline, coarse granular. Cl 90° pearly, meeting at 106° 40′. Fracture uneven and splintery. G. = 3 to 3·1. Translucent, vitreous. Greyish or greenish pale asparagus-green. Occurs as 1, 9 phosphoric acid, 34·5 alumina, 9·2 protoxide of iron, 9·3 soda, and 8·3 fluorine. Penig, Arendal, Chesterfield, Frances, also Hebron and Paris in Maine. Rarely contains no soda.

Triplite (Fe, Mn)$_3$P$_2$O$_8$ + (Fe, Mn)F$_2$.

Occurs in crystalline form (Sp. 669) ∞P 110° 10′, ∞P∞ 125° 10′. Cl perfect. H. = 5·5 to 6. G. = 3·6 to 3·8. Bright orange-red; streak yellowish white. Vitreous. Composition: alumina 17·2, iron protoxide 31·1, soda 1·1, fluorine 7·7. Durango (Mexico).

HERDERITE.

Occurs massive. P polar edges 77° 20′ and 141° 16′, ∞P 115° 24′. Fracture conchoidal. H. = 5. G. = 2·9 to 3. Translucent, inclining to resinous. Yellowish or greenish white. Ehrendorf in Saxony. An anhydrous phosphate of alumina, lime and fluorine.

PHOSPHATES WITH SULPHATES AND BORATES.

SVANBERGITE.

Rhombohedral, R 90° 35′. H. = 5; G. = 2·57. Vitreous to resinous. Honey-yellow, reddish-brown, and rose-red; streak white. Subtranslucent. Composition: 27·8 alumina, 6 lime, 17·3 sulphuric acid, 12·8 soda, 17·8 phosphoric acid, 6·8 water. Horrsjöberg in Wermland.

DIADOCHITE, Fe$_2$P$_2$O$_8$ + 2FeSO$_4$ + 32H.

Botryoidal and stalactitic, fracture conchoidal. H. = 3, G. = 1·9. Resinous; vitreous. Yellow or yellowish brown, streak white. Composition: 36·7 iron protoxide, 11·8 phosphoric acid, 15·2 sulphuric acid, and 30·3 water. Grafenthal and Stalheld.

DUFRENITE, Fe_5S_8 + 2FeAs + 24H.

Botryoidal and tabular, brittle, fracture conchoidal. H. = 2·3; rarely to 2·5. Translucent throughout, or on the edges, resinous to vitreous. Yellowish, reddish or blackish brown, sometimes in stripes, streak light yellow or white. Composition: 35·00 protoxide of iron, 3·00 arsenic acid, 11 sulphuric acid, and 21 water. In many mines, as Freiberg and Schneeberg.

BEUDANTITE.

Rhombohedral; R 91° 18′. H. = 3·5; G. = 4. Vitreous. Olive-green, streak greenish-yellow. Composition: 40·69 oxide of iron, 0·55 oxide of lead, 1·76 sulphuric acid, 8·97 phosphoric acid, 9·77 water. Horhausen in Nassau, Cork in Ireland.

LAZULITE (?Mg, Fe)$_3$P$_2$O$_8$ + Al$_2$(OH)$_6$P$_2$O$_5$.

Masses of fibrous structure. Composition: 25·2 magnesia, 29·8 phosphoric acid, 11·7 boracic acid, 30·23 water. Lunenburg.

ARSENITES.

SCHNEEBERGITE, $Pb_3As_2O_8$ + 2PbCl$_2$.

Monoclinal. Cl. 0P. H. = 2·5 to 3, G. = 7·14. Pale green, passing into grey, resinous on fracture. Composition: 59·67 oxide of lead, 10·39 oxide of copper, 10·39 chlorine, 7·58. Långban in Wermland.

LIROCONITE, $Cu_3As_2O_8$ + 4Al$_2$(OH)$_6$P$_2$O$_5$ + 9H$_2$O.

Monoclinal, P 116° 30′. Blue-green. Lustrous. Copiapo in Chili.

SILICATES.

ANHYDROUS SILICATES OF THE GENERAL FORMULA R_2SiO_4.

OLIVINE GROUP.

OLIVINE AND CHRYSOLITE.

Rhombic prisms, 0P : ∞P∞ (*b*) 130° 0′, P∞ (*o*) 109° 1′, P∞ (*s*) 109° 51′.

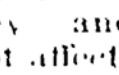

Fig. 446.

Fig. 447.

Granular. Cl *m*; fracture splintery. H. = 7 to 7·5; G. = 3·1 to 3·4. Rolled, vitreous. Grey, green, red, or blue. B.B. infusible. Not affected by acids. Composition: alumina 63·1, silica 36·9. Cl (figs. 446 to 449) and Clova in Aberdeenshire, Marnoch and

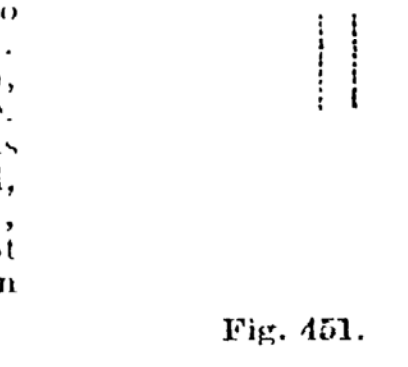

Fig. 448. Fig. 449.

ne in Banffshire, Killiney Bay in Wicklow, Andalusia, Penig, Massachusetts, Litchfield in Connecticut.

Chrysolite. H. = 6·5 to 7·0, G. = 3. Pale grey, yellow, green, red. A compound structure, formed of four double wedge-shaped crystals, arranged in contact with the angles of a square conoidal crystal placed in their centre, and imbedded in a paste of clay slate. The section of the compound structure forms a tesselated cross, the appearance of which varies with the portion of the crystal which is cut. Portsoy (fig. 450) and Boharm in Banffshire, Wicklow, Keswick and Skiddaw, Pyrenees, Maine, New Hampshire, Nova Scotia, Canada.

461. CYANITE (*Disthene*), AlSi.

Anorthic, generally broad-prismatic lengthened crystals by two faces (*m*, *l*). *m* / 106° 15′; *m* : *c* 145° 41′, *p* : *m* 93° 15′ (fig. 451).

Quintuples common, united by *m*. Also radiated. Cl. *m*, perfect, brittle. H. = 7, on *c* plane, 5, G. = 3·5 to 3·7. Pellucid, vitreous. Cl pearly. Colourless, and red, yellow, green, grey and blue. B.B. infusible. Not affected by acids. Cr. same as andalusite. Hillswick in Shetland, Mount Battock, Tarf side (fig. 451), Botriphnie (Banffshire), Tyrol, St Gotthard, Bohemia, Pontivy in France.

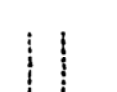

Fig. 451.

462. SILLIMANITE, AlSi.

Right prismatic; ∞P 111°. Crystals fibrous, columnar, radiating. Cl macrodiagonal. H. = 7; G. = 3·2 to 3·26. Translucent, on *c* vitreous. Greyish, greenish, clove, or hair-brown. Cr. and chemical characters like cyanite. Tvedestrand, Chester and Norwich, Connecticut. $Al_2O_3SiO_2$ is thus trimorphous. *Monrolite*, *Xenolite*, *Bucholzite*, *Fibrolite*, and *Bamlite* are varieties.

463. TOPAZ, 5AlSi + AlF$_3$ + SiF$_4$.

Right prismatic. ∞P (*M*) 124° 17′, 2P∞ (*n*) 92° 42′, ∞P3 (*l*) 143° 14′, P (*o*). Crystals always prismatic (fig. 122), often hemihedral, perfect, fracture conchoidal. H. = 8; G. = 3·4 to 3·6. Transparent, vitreous. Colourless, honey-yellow, amber, asparagus-green, blue. Becomes electric by heat or friction; the yellow colours become pink. B.B. infusible. Not affected by acids, by digestion in sulphuric acid gives traces of fluorine. Its formula requires 33·2 silica, 56·7 alumina, 17·5 fluorine, 12·6 of the oxygen must be replaced by fluorine, as the total of this is 107·4. Ben-a-bourd and Arran, Scotland; Mourne Mountains, Ireland; St Michael's Mount, Cornwall; Siberia, Saxony, Connecticut, Australia, Ceylon, Brazil, Peru. The finest crystals are the blue from Scotland and Siberia, the pink, those from Brazil and the colourless from Peru. The last-named may be distinguished at once from diamond by the electricity. *Pycnite* is a massive opaque cleavable variety from Finbo. *Pycnite* is a columnar straw-yellow to reddish variety from Zinnwald in Saxony and Durango in Mexico.

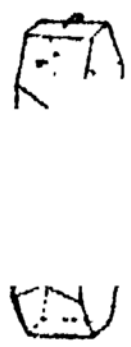

Fig. 452. (Sp. 464.)

464. STAUROLITE, Al, Fe)Si + (Fe, Mg)Si.

Right prismatic. ∞P (*m*) 128° 42′, P∞ (*r*) 70° 46′, ∞P∞ (*a*), 0P (*p*) (fig. 452). Twins common, as figs. 140, 144, 167, 453. Cl. brachydiagonal, perfect; fracture conchoidal to splintery. H. = 7; G. = 3·5 to 3·8. Transparent to opaque; vitreous to resinous. Reddish brown, white. B.B. infusible. Not affected by h. acid, partially by

: silica 30, alumina 48·5, with 5·5 iron peroxide, 12·5 iron toxide, 3·5 magnesia; often impure. Bixeter Voe and Unst in tland, Boharm and Marnoch in Banffshire, St Gotthard, Greiner Tyrol, Finistère, Urals, and North America. *Xantholite* is a ow variety from Urquhart (Inverness).

465. Sapphirite, $4\dot{M}g, 5\dot{A}l, 2\ddot{S}i$.

Oblique prismatic; granular. H. = 7 to 8; G. = 3·4 3·5. reous; pale blue or green; translucent; dichroic. C.c.: mina 2, magnesia 19·3, silica 14·9. Fiskenaes in Greenland.

Tourmaline Group.

466. Tourmaline, $\dot{R}_3\ddot{S}i + \dot{R}\ddot{S}i$.

Rhombohedral; R 133 10′. Crystals of 0R (*c*) ½R; usually g prismatic, and striated (fig. 45, and 249 to 252 Generally himorphic; also radiating and fibrous; fracture conchoidal to ven. H. = 6·5 to 7·5; G. = 3 to 3·3. Black varieties opaque ers transparent; vitreous. Generally black; but colourle ow, brown, blue, green, and rose-red; streak white. Different ours often disposed in layers parallel to the axis; and tions of one crystal differing also in colour along the s. By friction acquires positive electricity, and becomes elec ally polar when heated. Powder insol in h. acid; imperfectly . acid. C.c. complex, but all with water and fluorine, some with acic acid. Coarse black columnar varieties, called *Schorl*, very mmon in granite and gneiss. Black occur at Portsoy in Banff, va, Cabrach, and Rubislaw in Aberdeenshire, Bovey in Devon re, St Just in Cornwall, in Greenland, Arendal, Tyrol, and North erica; blue or *Indicolite* at Uto in Sweden, green at Glen Skiag Cromarty. Crystals ruby-red within, surrounded by green or red one extremity and green at the other, also blue and pink, at auy, Paris, and Hebron in Maine Currant-red or *Rubellite* in ia and Ceylon, also in Siberia and Brazil.

467. Datholite, $Ca\dot{B} + Ca\ddot{S}i_2 + \dot{H}$

Oblique prismatic, C 89° 51′. ∞P 115° 22′, ∞′P ∞ 76° 38′, P) 120°, ·P∞ (*a*) 45° 8′, ∞P∞ 2P∞ (*o*) (fig. 454); or rhombic h *b* : *f* 90°, *b* : *a* 135°, *b* : *c* 141° 9′, *f* : *g* 160° 39′. Fracture uneven, conchoidal. H. = 5 to 5·5; G to 3. Transparent or translucent; reous. Colourless and tinted green yellowish, or pink. In closed e yields water. B.B. intumesces melts easily to a clear glass, colouring the flame green, the der gelatinizes in h. acid. C.c.: 38·1 silic 21·6 boracic acid, 7 lime, and 5·6 water. hopton in Renfrew, Glen g in Perthshire (fig. 455), sbury Crags and Corstor- ne Hill near Edinburgh, ndal, Uto, Andreasberg, sser Alp, Connecticut, New Jersey. Figs. 238, are pseudomorphs of rtz after datholite termed *ytorite*.

Emerald-green, inclining to verdigris-green or blackish-green; streak green. Ce. = 38·7 silica, 50 copper protoxide, and 11·3 water. Altyn-Tubeh in the Kirghis Steppe; Mooch noya, Copiapo.

71 (*s*) : 293*a*.

491. CHRYSOCOLLA, $CuSi + H$.

Botryoidal or mammillated; fracture conchoidal. H. = 2 to 3; G. = 2 to 2·2. Trans-lucent; resinous. Verdigris-to emerald-green or azure-blue; streak green or white. Ce. = 34·83 silica, 44·94 copper protoxide, and 20·23 water. Leadhills, Lan-ark-shire in England; Cornwall, Saxony, Hungary, Spain, Urals, Australia, Chili.

492. BOGOSLOVSKITE (*Kupferblau*).

Massive, fracture conchoidal, brittle. H. = 4 to 5; G. = 2·56. Sky-to ultramarine-blue; streak smalt-blue, and shining. A silicate of with 45·5 per cent. copper oxide. Schapbach Valley in Bogoslowsk in the Ural. *Dx*

GARNET GROUP

GARNET, $R_3Si_2 + RSi$.

; most common forms ∞O and $2O2$ (*e*) (fig. 10, 60, 475) annular. Cl. dodecahedral; fracture conch 5 to 7·5; G. = 3·5 to 4·3. Pellucid s or resinous. Rarely colourless or generally red, brown, black, green, or B.B. in general fuses to a glass, black in those containing much iron, green wn in the others, and often magnetic. ctly soluble in h. acid. Ce. ex-ly variable, but generally forming two according as R_2O_3 is chiefly alumina or iron peroxide; and these are again according as RO is more especially lime, iron pro magnesia, or a similar base. The more important varieties

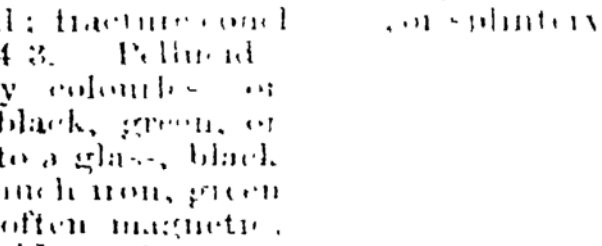

Fig. 475.

Lime-Alumina Garnet, $Ca_3Si_2 + AlSi$, with 40 silica, 23 a, and 37 lime. To this subdivision belong

Water Garnet.—Colourless to white. Craig Mohr, Aberdeen; hauk in Norway.

Grossular.—Olive- to gooseberry-green. Craig Mohr; Wilui America.

Cinnamon Stone.—Hyacinth-red to orange-yellow. Glen (Aberdeen), Allt Gonolan and Old Ban (Inverness), Ceylon, and. *Romanzowite*, from Kimito (Finland), is the same ariety when polished is often sold as *Hyacinth*.

Common Lime Garnet.—Here one half of the alumina is d by iron peroxide. Colours red, brown, yellow. Piedmont, us, the Urals.

Magnesia-Alumina Garnet; RO chiefly magnesia. Arendal.

(3) *Manganese-Alumina Garnet*; RO = MnO; reddish- Spessart (Bavaria), Sweden.

(4) *Magnesia Iron-Lime-Alumina Garnet, Pyrope.*—Colou wine to purplish red. Elie in Fife, Zoblitz in Saxony, Bol

(5) *Iron-Alumina Garnet, Almandine, Noble Garnet.*— lime-red, inclining to violet, blood-red, and reddish Common in mica-slate, gneiss, and granite. Shetland, Inverness, Aberdeen, Fahlun, Arendal, Tyrol, the Urals, America, Pegu, and Ceylon.

(6) *Lime-Chrome Alumina Garnet.* $Ca_3Si_2 + (Cr, Al)Si$, *ite.* Emerald green; with 22 per cent. chrome oxide. and Kyschtimsk in the Urals, India, and California.

(7) *Lime and Iron Garnet*, $Ca_3Si_2 + Fe_2Si$. This includ

(*a*) *Common Iron-Garnet, Kolophite, Melanite.* Subtran or opaque. Green, brown, yellow, or black, with white, yellow streak. Sweden and Arendal.

(*b*) *Melanite.* Black, opaque; in thin splinters trans streak grey, chiefly magnetic. Albano near Frascati, V Frames, Lappmark.

(*c*) *Colophonite.* Yellowish brown to pitch-black, also re red, resinous, streak white. G. = 3·43. Arendal.

The red varieties when cut *en cabochon*, are termed *Carb*

494. AXINITE, $(Al, Fe)_2Si_3 + (Ca, Fe)Si$.

Anorthic. Crystal unsymmetrical. $a : b : c = 0·492 : 1 : 0·491$; α 38', β = 133° 15' 48", γ = 136° 13'. Cl. distinct along plane cating the sharp edge between *l* and *a* and *l'* in fig. to 7, G. = 3·2 to 3·3. Pellucid, vitreous. Clove brown, inclin mole grey or plum blue, but often cinnamon brown in co tion, dark violet blue in a second, and pale olive-green in (*Oisanite*). B.B. colour flame-green, intumesces, and fuses to a dark green glass, becoming black in the O flame, not acid till after ignition, when it gelatinizes. Ce. = 45·9 sil boric acid, 17·6 alumina, 9·3 iron (with manganese) pr and 21·4 lime. Botallack and other mines in Cornwall (Corsain in Dauphiné, Kongsberg, Arendal, Nordmark in S Pyrenees, St Gotthard, Tyrol, Thann in Saxony, Ural, an America.

495. DATOLITE, $CaSi + BSi$.

Right pr-matic. ∞P 114° 32', $\infty P2$ (*o*) 91° 52', $P\infty$ 2, $4P\infty$ (*n*) 54° 58', $0P$ (*c*) : P (*o*) = 129° 29', $2P\infty$ (*p*) : ∞P (*o*) =

Fig. 476. Fig. 477. Fig. 478.

Cl. basal, fracture uneven to sub-conchoidal; very brittle. H. = 7 to 7·5, G. = 2·9 to 3·0. Pale yellow to brown. Translucent, brittle. Ce. = 22·5 to 23·5 lime, 28·4 to 28·6 48·76 silica. Danbury in Connecticut, Kilsaith in New Yo

HELVINE GROUP.

496. HELVINE, $MnS + 3R_3Si_2$.

Cubic and tetrahedral. $\frac{O}{2}$ or $\frac{O}{3}$ or $\frac{O}{4}$. H. = 6 to 6·5, G. = 3·1. Translucent on the edges. Lemon-yellow, green, or yellowish brown. B.B. in the red flame intumesces to a yellow or clove-brown bead; soluble in h. acid, sulphuretted hydrogen separated. Ce. = 31 silica, 10 8 iron protoxide, 7 glucina, 4 protoxide, and 5 sulphur enberg in Saxony, and near Modum in Norway.

497. DANALITE, $FeS + 3R_3Si_2$.

Cubic. Octahedra, with striated dodecahedral planes to 6, G. = 3·4. Vitreous to resinous. Flesh-red to grey lighter. Translucent; brittle. Ce. = protoxide of iron manganese 6·5, of iron 19, silica 31·5, sulphur 5·5. Massachusetts.

498. EKMANITE, Bi_2Si_3.

Cubic and tetrahedral. $\frac{2O2}{2}$ and $\frac{2O2}{4}$. The crystals small, and often with curved faces; fracture conchoidal to G. = 6·9 to 7·1. Transparent and translucent. Clove brown, yellow, grey, or white; streak white or grey. 16·2 silica and 83·8 bismuth peroxide. Schneeberg and dorf near Freiberg.

Scapolite Group.

Sarcolite, 8Ca, 3Al, Na, 9Si.

nidal. P 102° 54′; ∞P∞; 0P, P, and other faces as in fig. any of the faces being alternately hemihedral. H. = 5·5 . = 2·93. Vitreous. Grey to rose-red. Translucent; very C. c.: alumina 21·5, lime 32·4, soda 3·3, silica 40·5. to a white enamel; gelatinizes with acids. Somma.

Fig. 480 (sp. 499).

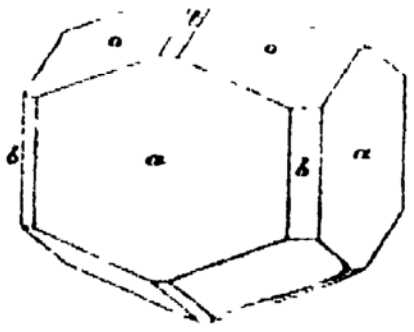

Fig. 481 (sp. 500).

Melonite, 6(Ca, Na), 4Al, 9Si.

ndal. P (o) 65° 42′; P∞ (l), ∞P (a), ∞P (b) (fig. 481). nohexagonal. H. = 5·5 to 6; G. = 2·6. Vitreous. Colourless or white. ent. Much cracked. C. c.: 31·9 , 26·2 lime, 41·9 silica. Gelatinizes. Somma.

Fig. 482 (sp. 501).

Lizzonite, 6(Ca, Na), 1Al, 1½Si.

ndal, P 64° 4′ (fig. 482). Similar to . C. c.: alumina 23·8, lime 8·8, silica 54·7. Insoluble in h. acid.

Scapolite, 3(Ca, Na)Si + Al_2Si_3.

ndal. P 63° 42′; ∞P∞; P; ∞P; also massive. Cl. perfect, and ∞P. H. = 5 to 5·5, G. = 2·6 to 2·8. Trans- translucent; vitreous, pearly, or resinous. Colourless, but grey, green, yellow, or red. B.B. melts with effervescence ular glass, in the closed tube may show traces of fluorine, ution of cobalt becomes blue. Sol. in h. acid. C. c.: 49 alumina (with iron peroxide), and 23 lime (with soda). cotland), Arendal, Tunaberg, Pargas, Massachusetts, and k. Known by its rectangular cleavage, resinous lustre on l surfaces, and action B.B. *Dipyre*, P 64° 4′, is a variety.

Melilite (*Humboldtilite*), 2(Ca, Mg)Si_2 + (Al, Fe)Si.

ndal. P 65° 30′, 0P, ∞P∞. Cl. basal, perfect. H. = 5 . = 2·91 to 2·95. Translucent on edges, vitreous to resin honey-yellow, orange-brown, and yellowish white. C. c. 7 magnesia, 9 alumina, 7 iron peroxide, 40 silica. Capo and Vesuvius.

Gehlenite, (Ca, Fe)$_2$Si + (Al, Fe)Si.

ndal. P 59°, 0P; ∞P∞, ∞P3; 2P. Cl. basal. H. = 5·5 . = 2·9 to 3·1. Translucent on edges. Dull resinous n, leek-, or olive-green, and liver-brown. C. c.: 22 , 5 iron peroxide, 35 lime, 4 magnesia, 31·4 silica. Monte Fassa Valley.

Nepheline Group.

Leucite, Al_2Si_4 + KSi.

ortahedral. Combination of the ditetragonal pyramid (*i*) with the ube, standard (*a*), and 2P∞ (*o*) with ∞P∞ (*m*). Hemitropes united

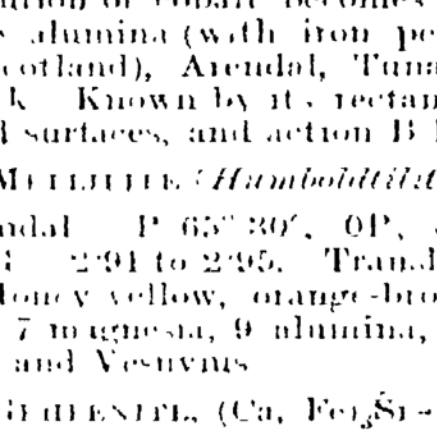

Fig. 483.

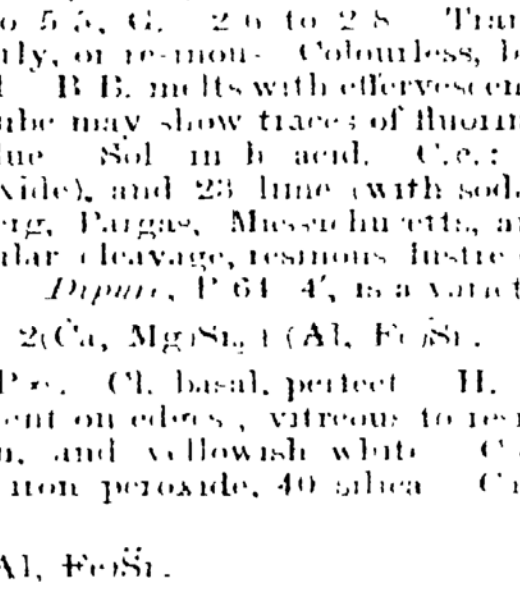

Fig. 484.

Fracture conchoidal. H. = 5·5 to 6, G. = 2·4 to 2·5. Trans- to translucent on the edges, vitreous inclining to resinous. ss, but greyish, yellowish, or reddish white; streak white. nfusible; with cobalt solution become blue. Sol. in h. acid, without gelatinizing. C. c.: 54·9 silica, 23·6 alum 21·5 potash. Abundant in the lavas of Vesuvius, the tu Rome, and the peperino of Albano; also at the Kaiserst near Lake Laach. Readily distinguished from analcime b fusibility, and by never showing faces of the cube.

506. Nepheline (*Elæolite*), $\dot{A}lSi + 4(\dot{N}a, \dot{K})Si$.

Hexagonal. P 88° 10′. ∞P, 0P, P common; also Crystals imbedded, or in druses; also massive-granular; fracture conchoidal, or uneven. H. = 5·5 to 6; G. = 2·58 to 2·64. Transparent or translucent; vitreous and resinous. Colourless or white (nepheline); or opaque, dull resinous, and green, red, or brown (elæolite). B.B. melts difficultly (nepheline), or easily with slight effervescence (elæolite), into a vesicular glass. Sol. and gelatinize in h. acid. C. c.: 41·2 silica, 35·3 alumina, 17 soda, 6·5 potash. Nepheline at Monte Somma, Capo di Bove, Katzenbuckel in the Odenwald, Aussig, and Lusatia. Elæolite in the zircon-syenite at Laurvig, Fredriksvarn, Brevig, and Miask.

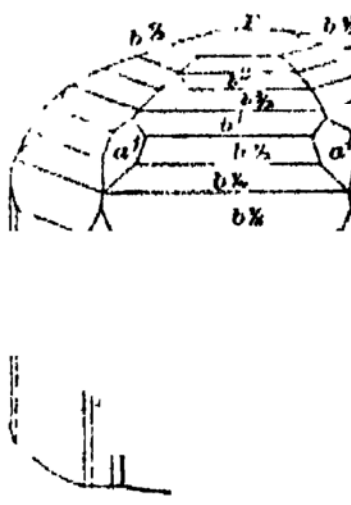

Fig. 485.

Davyne, with P 51° 16′, seems only a variety; as also *nite*, bright blue, and with some carbonate of lime.

507. Micro-sommite, $\dot{R}Si + AlSi + NaCl$.

Hexagonal. ∞P; 0P, ∞P2; ∞P⅔. Cl. ∞P. H. = 6; G. = to 2·53. Colourless to yellow; lustre silky. Somma and V

508. Sodalite, $3(AlSi + NaSi) + NaCl$.

Cubic, ∞O, and fig. 486; generally distorted; also mas granular. Cl. ∞O; fracture conchoidal or uneven. H. = 5·5; G. = 2·13 to 2·29. Trans- lucent; vitreous. White, grey, and rarely green or blue. C. c.: 37 silica, 31·8 alumina, 19·2 soda, 4·7 sodium, and 7·3 chlo- rine. Greenland, Vesuvius, Ilmen Hills, Fredriksvarn, and Litchfield in Maine.

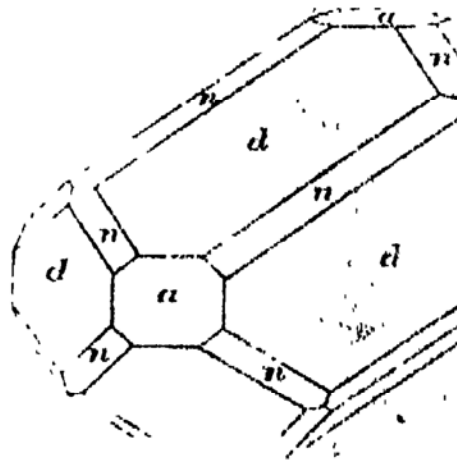

Fig. 486 (sp. 508).

509. Nosean, $3(AlSi + \dot{N}aSi) + \dot{N}aS$.

Cubic, and granular. H. = 5·5, G. = 2·28 to 2·40. Trans- lucent, vitreous to resinous. Ash or yellowish grey, sometimes blue, brown, or black. sites, 31 alumina, 25 soda, and 8 sulphuric acid. Lak and Rieden near Andernach, on the Rhine. Occurs in ph in minute crystals.

510. Hauyne, $2(AlSi + NaSi) + \dot{C}a\dot{S}$.

Cubic, chiefly ∞O; also fig. 487; but more common i Cl. ∞O. H. = 5 to 5·5; G. = 2·4 to 2·5. Semitransparent lucent, vitreous or resinous. Azure- or sky-blue, streak bluish white. C. c.: 34·2 silica, 28·5 alumina, 11·5 soda, 4·3 potash, 10·4 lime, and 11·1 sulphuric acid. Vesu- vius, Mount Vulture near Melfi, the Cam- pagna of Rome, and Niedermendig near Andernach.

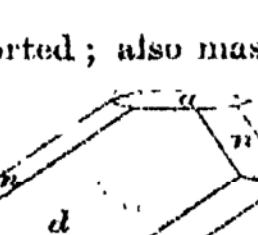

Fig. 487 (sp.

511. Lapis-lazuli.

Cubic; ∞O, generally massive, granu- lar. H. = 5·5, G. = 2·38 to 2·42. Trans- lucent on edges; dull resinous or vitreous. Ultrama azure-blue; streak light blue. B.B. fuses readily to porous glass. In h. acid the powder is dissolved and go evolving sulphuretted hydrogen. C. c.: 45·50 silica, phuric acid 31·76 alumina, 9·09 soda, 3·52 lime, 0·86 i chlorine, 0·90 sulphur, 0·12 water. Near Lake Baikal Tibet, Tartary, Monte Somma, and Chili. It is used for tal purposes, and in the preparation of ultramarine. T both in it and hauyne seems due to some compound o with sodium and iron.

Mica Group.

512. Biotite (*Magnesia-Mica*), $Al_2Si_2 + (Mg, K, Fe)_2Si$.

Oblique prismatic, C 89° 59′. 0P (*c*), 98° 41′ P (*m*), ∞P∞ (*b*), P∞ (*r*), -⅔P∞3 (*z*). Cl. basal, perfect; sectile; th elastic. H. = 2·5 to 3; G. = 2·85 to 2·9. Transparent, but o

thin plates. Generally uniaxal, sometimes with diver-
56°. Metallic, pearly. Usually dark green, brown, or black;
reenish grey or white. B.B. difficultly fusible to a grey or
ass. Completely sol. in concentrated s. acid, leaving white

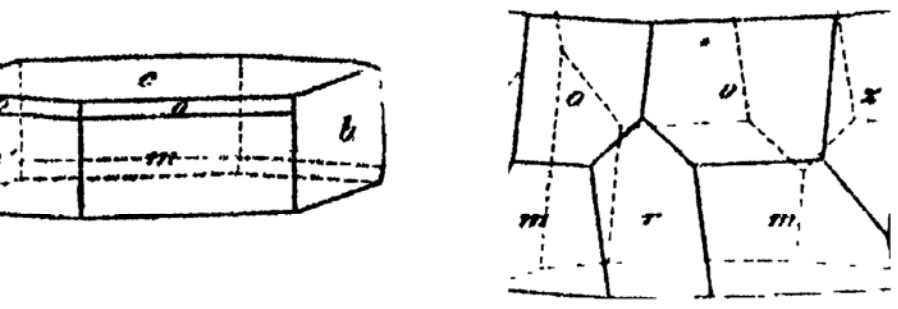

Fig. 488.

lates of silica. C.c.: 39 silica, 17 alumina, 10 iron protoxide,
nesia, 9 potash. Hillswick, Shetland, in gneiss, Sutherland,
averness, in limestone; Skye and Fife in trap; Parsa, Boden
reenland, New York. *Rubellan* is a decomposed variety

HAUGHTONITE, $(Al,Fe)\ddot{S}i + (Fe, K)\ddot{S}i$

ue prismatic. Cl. basal, perfect. H. = 3; G. = 3·1. Vitreous
iantine. Chocolate-brown to black. Weathers pale green
ry. Difficultly soluble in acids. B.B. fused with difficulty
hly magnetic bead. C.c.: silica 36, alumina 18, ferric oxide
rous oxide 18, magnesia 9, potash 8, water 3. Common in
nites of Scotland. Black Forest, Harzburg, Tyrberger.

LEPIDOMELANE, $(\dot{A}l,Fe)\ddot{S}i + (Fe, \dot{K})\ddot{S}i$

ue prismatic. Cl. basal, perfect; brittle. H. = 3. G. = 2·97.
s; transparent to opaque. Rich brown to raven black.
ses easily to a black feebly-magnetic bead. Sol. in h
aving pearly scales of silica. C.c.: 37 silica, 17 alumina, 24
roxide, 3 protoxide of iron, 8 potash, 10 magnesia, 1 water.
n gneiss, Scotland; common in granite, Ireland, and Pers-
weden.

ANOMITE, $12\dot{M}g, 3\dot{A}l, 2\dot{K}, H, 12\ddot{S}i$.

ue prismatic. $c : m$ 98° 42′. Forms c, m, o, b (see fig. 188),
nce of optic axes 12° to 16°. Monroe (New York), Lake Baikal.

PHLOGOPITE, $(\frac{3}{5}\dot{R}_4 + \frac{1}{5}\dot{R})\ddot{S}i_3$.

ue prismatic. 0P (*c*), P (*m*), −3P (*o*), ∞P∞ (*b*). *c* : *m* 98°30′
Cl. basal, perf. Pearly
netallic. Yellowish brown with copper-like reflexion, also
white, and colourless. Transparent. Divergence of optic
to 20°. C.c.: 14 alumina, 2 protoxide of iron, 28 mag-
·6 potash, 2·57 fluorine, 41 silica. B.B. whitens, and fuses
es. Decomposed by s. acid, leaving the silica in scales.
(Finland), Fassa Valley, New York, Canada, Ceylon. Char-
ic of serpentine and of dolomitic limestones.

ZINNWALDITE.

ue prismatic. Forms as in figs. 490, 491; also 2P∞ (*H*) and
). *m* : *c* 98° to 99°. Divergence of optic axes 65°. G.
3·2. C.c. similar to muscovite (sp. 519), but with 4 to

520. PARAGONITE (*Soda-Mica*), $3\dot{A}l_2\ddot{S}i_3 + (\dot{N}a, \dot{H})\ddot{S}i$.

Massive; foliated. Lustre pearly. H. = 2·5 to 3; G. = 2·7
Yellowish, greyish, and greenish. C.c.: 40·1 alumina, 6
47·75 silica, 4·6 water. Monte Campione, St Gotthard.

521. SANDBERGERITE (*Baryta-Mica*).

White minute scaled aggregates. G. = 2·894. C.c.: 30·2 a
4·9 magnesia, 5·9 baryta, 7·6 potash, 42·6 silica, 4·43
Pfitsch Valley in Tyrol, and the Swiss Alps.

522. MARGARITE (*Lime-Mica*).

Right prismatic. Cl. basal perfect. H. = 3·5 to 4·5, G. =
3·1. Lustre of cl. pearly. Lateral planes, vitreous. Snow
reddish white, and pearl grey. Lamina brittle. Opti
angle 109° to 129°. C.c.: 51·2 alumina, 11·6 lime, 2·6 so
silica, and 4·5 water. Greiner in Tyrol, Naxos, Asia Minor,
Pennsylvania, North Carolina. *Diphanite* is similar.

523. EPHYLLITE $(\frac{3}{5}\dot{R}_3 + \frac{1}{5}\dot{R})\ddot{S}i_3 + \frac{1}{5}\dot{H}$.

Like muscovite, but lamina not easily separable. H. = 3
G. = 2·83 to 3. Lustre of cl. pearly to adamantine. W
colourless. Transparent to opaque. Lamina brittle. Opt
angle 71½°. C.c.: alumina 42·3, lime 1·5, potash 3·2, so
silica 41·6, water 5·5. Unionville in Pennsylvania.

524. CLINOPTILE, $(\frac{3}{5}\dot{R}_3 + \frac{1}{5}\dot{R})_2\ddot{S}i + \frac{1}{2}\dot{H}$.

Oblique prismatic; in hexagonal tables, or massive foliate
basal, perfect. H. = 5 to 5·5, G. = 3·15. Translucent, p
metallic on the cleavage. Angle of the optic axes 3°
Reddish brown to yellow. C.c.: 39·7 alumina, 21·1 magne
lime, 19·2 silica, 2 protoxide of iron, 4·9 water. Amity in
wick in New York. *Brandisite* is similar.

XANTHOPHYLLITE.

Oblique prismatic, C about 90°. Crystalline aggregates
lamellar. H. = 4·5 to 6, G. = 3·1. Lustre pearly. Colour y
to copper-red. Angle of optic axes 0 to 20°. C.c. alumi
lime 13, magnesia 17·5, silica 16·9, water 5·1. Zlatoust.

526. CHLORITOID, $\dot{F}eSi + A\dot{H}$.

Right prismatic; in foliated crystals; brittle. Cl.
Lustre greasy to pearly. H. = 5·5 to 6; G. = 3·52 to 3·56
green; streak greenish white. C.c.: 40 alumina, 27 prot
iron, 25 silica, 7 water. B.B. infusible, but becomes m
Decomposed by s. acid. Hillswick in Shetland, Pregr
Tyrol, Ekaterinburg, Canada.

530. ASTROPHYLLITE.

Right prismatic, with oblique habit. In long tabular
and in stellate groups. Cl. basal, perfect. H. = 3·5; G
Submetallic to pearly. Tombac-brown to gold-yellow.
Axial divergence 113° to 124°. C.c.: peroxide of iron 9·3, p
23·6 protoxide of manganese 10, soda 3·9, potash 5·9, tu
7·90, silica 39·2. Brevig, El Paso in Colorado.

CHLORITE GROUP.

531. CHLORITE, $2\dot{R}\ddot{S}i + \dot{R}_2\dot{A}l + 3\dot{H}$.

Hexagonal. P 106° 50′; crystals tabular, of 0P, ∞P
(fig. 493); often in comb-like or other groups;
generally foliated and scaly. H. = 1 to 1·5; G. = 2·78
to 2·96. Leek-green to blackish green; streak
greenish grey. C.c.: 21 alumina, 20 protoxide
of iron, magnesia 18, silica 24, water 11. Tar-
side, Bute, and Jura in Scotland. Cornwall, Cumberland
Fassa Valley, Urals, America.

Massive. H. 2·0 to 3, G. 1·9 to 2·2. Translucent; ... Dull orange-yellow. C.c.: 41 silica, 37 magnesia, 22 water. ... Passau, Texas, Barchill near Baltimore. *Nickel-Gymnite* ... nickel oxide, replacing the water. Unst, Texas, Pennsylvania.

...ITE, 3(Mg,Fe)SiO₃ + (Al,Fe)SiO₃ + 3H.

Massive, sectile, and very soft. H. = 1·5; G. = 2·2 to 2·3. ... orange-yellow, pale green, and reddish brown. Feels greasy; ... adhere to the tongue, falls to pieces in water. C.c.: silica, ... alumina 7·3, ferric oxide 3·9, magnesia 20·6, water, 22·7. ... In all the above colours in the later igneous rocks of Scotland, ... monly. Unst and Point and St Clear in Cornwall, and Dalecarlia, Sweden. *Pencatite* has 2·8 oxide of nickel.

SERPENTINE, $2MgSiO_3 + Mg(OH)_2$.

Crystallization uncertain, pseudomorphic after olivine, ... generally massive, and granular or fibrous; fracture ... conchoidal, uneven, or splintery; sectile, and slightly ... H. 3 to 3·5, G. 2·5 to 2·7. Translucent to opaque; dull ... ours. Green, grey, yellow, red, or brown, often in spots, ... or veins; streak white, shining. Feels greasy, and does not ... to the tongue. In the closed tube yields water, and becomes ... C.c.: 43·5 silica, 43·5 magnesia, and 13 water; but with 1 to ... protoxide, and also carbonic acid, bitumen, and chrome oxide. ...

Varieties are—(1) *Noble Serpentine*, brighter coloured, ... and more translucent. (2) *Precolite*, or fibrous (H. = 3·5 to ... 3; *Common*, or compact, (4) *Chrysotile* (*Baltimorite*, *Metaxite*), ... fine asbestiform fibres, easily separated, with a metallic ... lustre (G. = 2·219).

Common in Shetland, Unst, Portsoy, Ballantrae; ... Point in Cornwall, Norway, Sweden, North America. Chrysotile ... at Colaburth and Unst, Shetland, Portsoy, Towanreiff, ... land; Reichenstein in Silesia, the Vosges Mountains, and ... America. Serpentine often a product of decomposition, or ... morph of various minerals, as augite, hornblende, olivine, ... enstatite, garnet, &c. It forms whole rocks and mountains, ... manufactured into various ornamental articles.

...ITE, $3MgSiO_3 + 2Mg(OH)_2$.

Oblique prismatic, often foliated. H. = 2·5 to 3; G. = ... 2·47. Lustre pearly. Greenish white, bluish white, and ... green. C.c.: silica 42·1, magnesia 38·5, water 17·5. ... In serpentine of Urquhart and Portsoy (Scotland) Cornwall, Hoboken.

ANTIGORITE.

Thin flat lamina. H. = 2·5; G. = 2·6. Translucent. Green, ... brown spots, streak white. C.c.: silica 40·8, magnesia 36·2, ... oxide of iron 5·8, water 12·4. Antigorio in Piedmont.

Sutherland, Portsoy, and near Kirkcaldy, Scotland; the ... Point, Cornwall; Briançon, Wunsiedel. Savage nations ... steatite into culinary utensils.

Potstone is a mixture of talc, chlorite, and other minerals.

541. PICROPHYLL, $3RSiO_3 + 2H$.

Right prismatic. H. = 2·5; G. 3·75. Dark green. F... shining. C.c.: magnesia 30·1, protoxide of iron 6·9, silica ... water 9·8. Sala in Sweden.

542. PICROSMITE, $2MgSiO_3 + H$.

Right prismatic, but massive. Cl. $\infty P\infty$ perfect, less so ... directions, sectile. H. 2·5 to 3; G. 2·5 to 2·7. Transl... opaque, vitreous, but pearly on $\infty P\infty$. Greenish white, ... blackish green, streak colourless. Yields a bitter odour ... breathed on, hence the name. C.c.: 55·8 silica, 36·1 magnesia, ... 8·1 water. Predazzo in Bohemia, and Greiner in Tyrol.

543. MONRADITE, $4(Mg,\frac{1}{2}Fe)SiO_3 + H$.

Massive, foliated, translucent, and yellowish-grey. H. = ... 3·27. C.c.: silica 56·5, magnesia 31·9, protoxide of iron 8·... 4·1. B.B. unfusible. Bergen in Norway.

544. MEERSCHAUM, $2MgSiO_3 + 4H$.

Fracture earthy, cohesive. H. 2 to 2·5; G. 0·8 to 1·... almost nearly 1. Opaque, dull. Yellowish and greyish white, ... slightly shining. Feels rather greasy, and adheres strongly ... tongue. C.c.: 51 silica, 21·7 magnesia, and from 9 to 21 ... Negropont, Anatolia, near Madrid and Toledo, Moravia, ... land.

545. ARTHROPHYLL, $4MgSiO_3 + H$.

Soft and earthy. G. = 2·21. Milk-white; opaque. C.c.: ... silica, 3·03 magnesia, 11·9 water. Langban (Sweden), Elba.

546. STADAITE, $Mg_2SiO_3 + 4H$.

Massive, fracture splintery; sectile. H. = 2·5. Trans... resinous. Red, with white streak. C.c.: 57 silica, 31·6 ma... 11·4 water. Capo di Bove near Rome.

547. GYMNITE.

Massive. H. 2·0 to 3, G. 1·9 to 2·2. Translucent; ... Dull orange-yellow. C.c.: 41 silica, 37 magnesia, 22 water. ... Passau, Texas, Barchill near Baltimore. *Nickel-Gymnite* ... nickel oxide, replacing the water. Unst, Texas, Pennsylvania.

548. SAPONITE, $\frac{1}{2}(CaMg_3Si_4O_{12}) + (Al,Fe)Si + 13H$.

Massive, sectile, and very soft. H. = 1·5; G. = 2·2 to 2·3. ... orange-yellow, pale green, and reddish brown. Feels greasy; ... adhere to the tongue, falls to pieces in water. C.c.: silica, ... alumina 7·3, ferric oxide 3·9, magnesia 20·6, water, 22·7. ... In all the above colours in the later igneous rocks of Scotland, ... monly. Unst and Point and St Clear in Cornwall, and Dalecarlia, ... Sweden. *Pencatite* has 2·8 oxide of nickel.

549. SERPENTINE, $2MgSiO_3 + Mg(OH)_2$.

Crystallization uncertain, pseudomorphic after olivine, ... generally massive, and granular or fibrous; fracture ... conchoidal, uneven, or splintery; sectile, and slightly ... H. 3 to 3·5, G. 2·5 to 2·7. Translucent to opaque; dull ... ours. Green, grey, yellow, red, or brown, often in spots, ... or veins; streak white, shining. Feels greasy, and does not ... to the tongue. In the closed tube yields water, and becomes ... C.c.: 43·5 silica, 43·5 magnesia, and 13 water; but with 1 to ... protoxide, and also carbonic acid, bitumen, and chrome oxide. ...

Varieties are—(1) *Noble Serpentine*, brighter coloured, ... and more translucent. (2) *Precolite*, or fibrous (H. = 3·5 to ... 3; *Common*, or compact, (4) *Chrysotile* (*Baltimorite*, *Metaxite*), ... fine asbestiform fibres, easily separated, with a metallic ... lustre (G. = 2·219).

Common in Shetland, Unst, Portsoy, Ballantrae; ... Point in Cornwall, Norway, Sweden, North America. Chrysotile ... at Colaburth and Unst, Shetland, Portsoy, Towanreiff, ... land; Reichenstein in Silesia, the Vosges Mountains, and ... America. Serpentine often a product of decomposition, or ... morph of various minerals, as augite, hornblende, olivine, ... enstatite, garnet, &c. It forms whole rocks and mountains, ... manufactured into various ornamental articles.

550. MONRADITE, $3MgSiO_3 + 2Mg(OH)_2$.

Oblique prismatic, often foliated. H. = 2·5 to 3; G. = ... 2·47. Lustre pearly. Greenish white, bluish white, and ... green. C.c.: silica 42·1, magnesia 38·5, water 17·5. ... In serpentine of Urquhart and Portsoy (Scotland) Cornwall, Hoboken.

551. ANTIGORITE.

Thin flat lamina. H. = 2·5; G. = 2·6. Translucent. Green, ... brown spots, streak white. C.c.: silica 40·8, magnesia 36·2, ... oxide of iron 5·8, water 12·4. Antigorio in Piedmont.

Hydrophite, $(\dot{M}g, \dot{F}e)_4\ddot{S}i_3 + 4\dot{H}$.

ive and fibrous. H. = 3 to 4; G. = 2·65. Mountain green to ack; streak paler. C.c.: silica 36·2, magnesia 21·1, protoxide 22·7, water 16. Taberg in Sweden, New York.

Villarsite, $2\dot{M}g_2\ddot{S}i + \dot{H}$.

t prismatic; crystals P, 0P, meeting at 136° 32′, often twins e combination; also granular. H. = 3; G. = 2·9 to 3. Trans Greenish to greyish yellow. C.c.: silica 39·6, magnesia rotoxide of iron 3·6, water 5·8. Totaig, Ross-shire; Traver iedmont; Forez, France.

Pyrallolite.

que prismatic, C 72° 56′; columnar and granular. Cl nd hemidomatic, meeting at 91° 36′; fracture splintery. H. = 3·5 to 4; G. = 2·6. Translucent on edges; colours h to yellow-grey. C.c.: silicate of magnesia and water d in Finland.

Dermatine, $(\dot{M}g, \dot{F}e)\ddot{S}i + 2\dot{H}$.

form; stalactitic; fracture conchoidal, brittle. H. = 2·5; . Resinous. Blackish green, streak yellow. Does not to tongue. C.c.: silica 38, magnesia 22, protoxide of iron er 23. Waldheim in Saxony.

Chlorophaeite, $\dot{R}\ddot{S}i + \dot{R}_2\ddot{S}i_2 + 4\dot{H}$.

ive, rarely reniform. Coating or filling openings in amygd cavities. H. = 2·5; G. = 2·02 to 2·4. Scaly to fracture-con . On first exposure transparent and olive-green to orange- but soon changes to black and opaque, [illegible] Vitreous to shining. B.B. melts to a black [illegible] C.c.: 36·2, alumina 6·9, peroxide of iron 13·8, protoxide of iron ne 3·8, magnesia 10, water 24·8. Rum and Canna in the es, Giant's Causeway. The original mineral from Rum has on peroxide and no alumina.

Forchhammerite, $\dot{F}e\ddot{S}i + 6\dot{H}$.

ular massive. Subresinous to dull. Dark green. H. = 2, 8. C.c.: silica 32·8, protoxide of iron 21·6, magnesia 3·4, 2·2. Faroes.

Kirwanite.

druses in amygdaloids with divergent sheaf-like crystals. G. = 2·9. Opaque. Olive green to dark green. C.c.: silica lumina 11·1, protoxide of iron 2·39, lime 19·8, water 14. aa in Mull; Mourne Mountains in Ireland.

Glauconite.

nd grains. Dull resinous. Light green. C.c.: silicate of de of iron and potash. Ashgrove near Elgin; green sand land, France, Germany, and America.

Celadonite, $3\dot{R}\ddot{S}i_2 + \dot{R}_2\ddot{S}i_2 + 5\dot{H}$

ive, forming crusts, as of agate. Earthy-subtile. H. = 1 3. = 2·6 to 2·8. Opaque, shining. Bright green. Feels C.c.: silica 54, alumina 3·8, ferric oxide 11·9, ferrous oxide agnesia 6·8, potash 7·9, water 10. Orkney, Rum, and re in Scotland. Giant's Causeway, Verona, Faroes, Iceland, , Bohemia.

Stilpnomelane, $2(\dot{F}e, \dot{M}g)\ddot{S}i + Al\ddot{S}i + 2\dot{H}$.

sive or radiating-foliated. One cl. perfect; brittle. H. = 3 to 3·4 to 3·4. Opaque; vitreous to pearly. Greenish black. C.c.: lica, 6·9 alumina, 38·3 iron protoxide with 2 to 3 magnesia, 5 water. Zuckmantel in Silesia and Wellburg in Nassau.

Chamoisite.

tic and massive. H. = 3; G. = 3 to 3·4. Greenish grey to streak paler. C.c.: silica 11·3, alumina 7·8, protoxide of 0·5, water 17·4. Chamoison (or Chamoson) in Valais, the . *Berthierine* has 75 protoxide of iron and 5 of water; e.

Augite and Hornblende Group.[1]

ublende and augite rather represent groups of mineral sub- than single species. They are best distinguished when ectly formed, by the cleavage and angles of the prisms.

Enstatite (*Chladnite*), $\dot{M}g\ddot{S}i$.

[1] Hornblende and augite agree so closely in crystalline forms and chemical com that it has sometimes been proposed to unite them in one species. They, r, differ too widely to justify their union. Hornblende is more fusible, ges lower in specific gravity (hornblende from 2·93 to 3·45, augite 3·625). Though both possess a cleavage parallel to their vertical yet these differ in angular dimensions: hornblende 124° 12′, augite 87° y also occur in distinct geognostic positions – hornblende in rocks con- quartz or free silica, and mostly with minerals that are neutral compounds , as orthoclase and albite; augite in rocks that do not contain free silica, tly with minerals that are not neutral silicates, as labradorite, olivine, and Hence there are two distinct series of massive or igneous rocks: the nde series, including granite, syenite, diorite, diorite-porphyry, and red y; and the augite series or hypersthene rock, gabbro, dolerite, nephe- ugite-porphyry, and leucite-porphyry.

Right prismatic. ∞P 92° to 93°; crystals ∞P∞ (*a*) ∞P (*m*), ½P∞ (*l*), ⅓P∞ (*q*), ¼P∞ (*ψ*), ⅓P (*τ*) (fig. 497). Usually imbedded, or indistinct granular masses. Cl macrodiagonal very perfect, prismatic ∞P distinct, brachydiagonal imperfect. H. = 5·5; G. = 3·1 to 3·3. Translucent throughout, or only on the edges, vitreous or pearly on the more perfect cleavage-planes. Colourless, greyish or greenish white, yellowish, or brown. Not affected by acid. B.B. almost infusible. C.c.: 60 silica and 40 magnesia, but with 6 to 8 iron pe 1 to 2 alumina, and 1 or 2 water. In olivine and cr rocks in Moravia, the Harz (Baste), and the Pyrenee

561. Bronzite (*Schiller Spar, Bastite*), (Mg, Fe)Si.

Right prismatic. ∞P 91° only granular and foliated brachydiagonal perfect, prismatic less so; fracture uneven tery. H. = 4 to 5. G. = 3 to 3·5. Translucent on thin metallic pearly. Green, inclining to yellow or brown. Is tly sol. in h. acid wholly in c. acid. B.B. becomes m and fuses in very thin splinters. C.c.: 43 silica, 26 magne lime, 7·4 iron protoxide, 3·3 iron peroxide, 2·4 chrome ox alumina, and 12·4 water. *Bastite* is specially altered o Belhelvie and Black Dog in Aberdeenshire, Baste in Tyrol, B Styria.

565. Paulite (*Hapalotrope*), Fe, Mn, S.

Right prismatic. ∞P *nn* 93° 30′, P2 (*o*) 2P2 (*n*) ∞P2 (*m*), ½P2 (*h*), ∞P2 (*g*), ∞P∞ (*b*), 2P∞ (*x*) Granular or disseminated. Cl brachydiagonal very prismatic ∞P distinct, macrodiagonal very imperfect. G. = 3·3 to 3·4. Opaque or translucent on thin edges. V mmons, but metallic pearly on the cleavage-planes of white copper-coloured to violet or silvery black and greyish-black, steel-green or pinchbeck-brown inclining to copp Not affected by acids. B.B. melts

Fig. 498.

less easily to a greenish-black glass, often magnetic. C.c. ally 46 to 58 silica, 0 to 1 alumina, 11 to 20 magnesia, lime, 13 to 31 iron protoxide, 0 to 6 manganese protoxide and Craig Buroch in Banffshire, Barra Hill in Aberdeenshire Island, Labrador, and Greenland. Crystals occur in s bombs at Lake Laach (*Unkel Spar*) and in meteorites of Bach. Hyper-thene rock in Norway, Eläal in Sweden, C ro, the Harz, and Canada. Chemically enstatite and pau into one mother, the essential difference is that the axial di is uniformly p- e in the former, and the opposite in the la

566. Wollastonite (*Tabular Spar*), CaSi.

Oblique prismatic, C 84° 30′. ∞P 87° 18′, oP ∞ ∞P∞ (*x*, 93° 42′), ∞P (*m*, 110° 7′), ∞P2 (*o*, more 51°), P∞ (*r*) 11 °′, 2P∞ (*z*, 69° 56′) (fig. 500). Rarely crystallized, mostly broad prismatic or lamellar. Frequently fibrous. Cl along oP and ∞P∞ perfect, but plane uneven or rough; meet at 95° 23′. H. = 4·5 to 5; G. = 2·8 to 2·9. Translucent; vitreous or pearly on cleavage. White, inclining to grey, yellow, red, or brown; steel

Fig. 500.

resces with heat or friction; gelatinizes in h. acid. B.B. ly fusible to a semitransparent glass. C.c.: 51·7 silica 3 lime, but with 0 agnesia and 0 to toxide. Glen Gair &c.,

Urquhart in Inver- ye, Banat, Finland, Vesuvius (fig. 501, mineral

Fig. 501 (n. 566)

Arendal (*Lavrovite*

Mt. Hosta.

o prismatic, C 74° 11 6, P : s 120° 48 131° 30', 21° 00' 95 ∞P, ∞P∞. In fig. 130 ∞P (*M*), ∞P∞ (*a*), ∞P∞ also various twins and hemitropes of same form (figs. 503). Almost always prismatic, imbedded, or attached; niar, columnar, and scaly. Cl. prismatic along ∞P (with

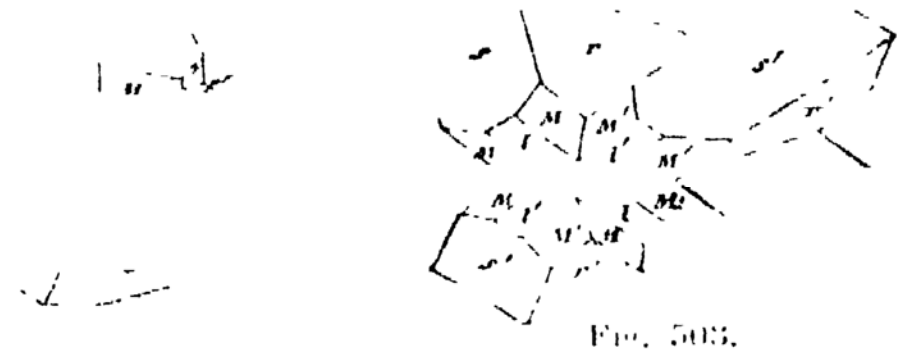

Fig. 503.

f 87° 6' and 92° 54'), generally rather imperfect, ortho- and clinodiagonal imperfect. H. 5 to 6; G. 3 to 3·5. n all degrees vitreous; in some pearly on ∞P∞. Colour- wh , b , ally gray gr , bl , erally mperfectly soluble in acids. C.c. generally as follows:

	Silica	Lime	Magnesia	Iron
nesia augite	56·22	25·51	18·24	...
nesia iron augite	52·72	21·81	8·50	14·97
augite	49·06	22·29		28·65

gives 17 to 56 silica, 20 to 25 lime, 5 to 15 magnesia, iron protoxide, with 0 to 3 manganese protoxide and 0 to 8 The diamma, chiefly found in very dark green or bla l may in some replace either silica or part of the silicate nore important varieties are

ite Greyish or greenish white, to pearl-grey or leek-green, white Crystallized or broad columnar, or concentric Transparent to translucent on the edges. Not affected B.B. fuses to a whitish semitransparent glass. C.c. y lime 26 and magnesia 18·5, with 55·5 silica Mussa Alp and Ala (*Ialite*) in Piedmont, Schwarzenstein in Tyrol, avia, Finland, Urals, and North Amer a.

olite, Sahlite White, green, rarely yellow, brown, or red, hite. Translucent, or only on vitreous, inclining to pearly crystallized, mostly columnar

Fig. 504.

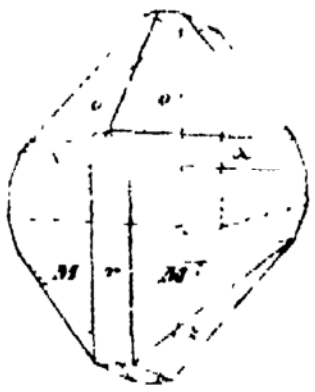

Fig. 505.

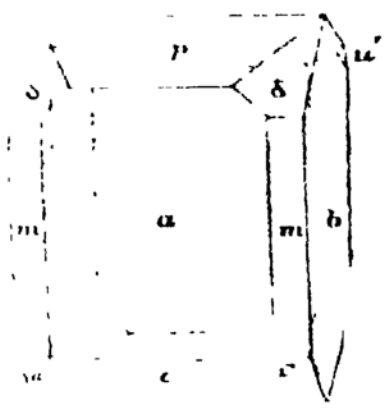

Fig. 506.

llar. B.B. melts to a green- l glass. Malacolite common in limestones in Scotland, as at s, Ledbeg (fig. 505), and Glen Fassa Valley (*Fassaite*) Piedmont, Arendal, Philipstadt in Sweden; Lake Baikal (*Baikalite*); near Lake Lherz in the P (*Lherzolite*); Sala (or Sahla) in Sweden (*Sahlite*); Shinne 504, 506), Glenelg, Tiree, in Scotland; Tyrol; North A *Coccolite* is a granular sahlite or augite.

Augite.—Leek-green, greenish black, or velvet-black brown; streak greenish grey. Vitreous to resinous; tra or opaque. Only slightly affected by acids. B.B. fuses to often magnetic glass. An essential component of many as basalt, dolerite, clinkstone, and augite porphyry; G Auvergne, Vesuvius; St Kilda, Rum, Tiree, Dalnain, and U in Scotland. Augite crystals in basalt often contain very m croscopic crystals and glasses; also pores with fluid carbo

Hudsonite.—Cleavable lamellar, and jet-black, with gree and bronzy tarnish, from the Hudson river; the most high ginous variety

Amianthus—Some asbestiform minerals are augite, greater number hornblende.

Breislakite—Fine yellowish or brown woolly crystals. V and Capo di Bove near Rome

568. Diallage, (Ca, Mg, Fe) Si.

Like augite, and only a variety with very perfect cle the clinodiagonal, which forms with a second cleavage an 87°. Lustre metallic pearly; colour grey or pinchbeck H. = 4; G. = 3·23 B.B. melts easily to a greyish or enamel. C.c. 50 to 53 silica, 1 to 5 alumina, 15 to 23 m 11 to 20 lime, and 5 to 20 manganese protoxide. Consti the augite rock of the Cuchullins in Skye and of the gabbro and Ayrshire. Baste in the Harz, Silesia, the Alps, Ap and Urals. *Vanadine Bronzite*, containing soda and vana is similar. At Craig Buroch (Banffshire) diallage passes in

569. Jeffersonite

Oblique prismatic. Cl. prismatic ∞P' 87° 30', and orthod H. = 4·5, G. = 3·3 to 3·5. Dark olive-green, brown to black greasy. A manganese and zinc augite, with 10·2 prot manganese, and 10·15 oxide of zinc. Sparta in New Jerse

570. Acmite, $2Fe\dot{S}i_2 + 3R\dot{S}i$.

Oblique prismatic. Crystals long often acute-pointed ∞P 87° 15', ∞P∞ (*x*), P(*s*), 6P (*o*), $6P^c3$(*z*) (figs. 507, 50 like augite. H. 6 to 6·5, G. = 3·4 to 3·6. Nearly opaque; vitreous. Brownish or greenish black, streak greenish grey. Imperfectly soluble in acids. B.B. fuses easily to a black magnetic glass. C.c. 52 silica, 30 iron peroxide, 5 iron protoxide, and 13 soda, but with 1 to 3 manganese peroxide, and also 3 to 4 titanic acid. Eger and Porsgrund in Norway.

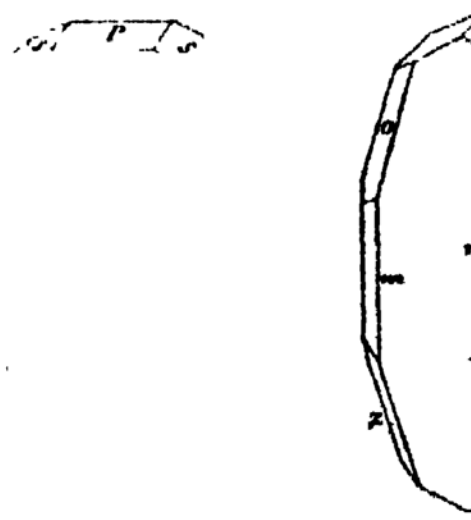

Fig. 507. (Sp. 570.)

571. Ægerine, $R_2Si_3 + R\dot{S}i + 2Na\dot{S}i$

Oblique prismatic: striated or reed like prisms of 86 feet, less distinct clinodiagonal, and prismatic. H. = 5 G. = 3·4 to 3·5 or 3·6. Vitreous, translucent on edges, or Greenish black. B.B. fuses easily, colouring the flame Scarcely affected by acids. C.c.: 49 silica, 31·7 iron 6·6 iron (and manganese) protoxide, and 12·7 soda, wit magnesia and potash. Has the same relation to augite a sonite to hornblende. Near Brevig and Barkevig in Norw

572. Spodumene, $4\dot{A}l\dot{S}i_2 + 3(\dot{L}i, \dot{N}a, \dot{K})\dot{S}i$.

Oblique prismatic, C 69° 40' ∞P 87° (fig. 509). Cl. prism and orthodiagonal, perfect, chiefly massive or foliated. H. = 6·5 to 7; G. = 3·1 to 3·2. Translucent; vitreous or pearly. Pale greenish grey or white to apple-green; streak white. B.B. intumesces slightly, tinging the flame momentarily purplish red, and fuses easily to a colourless glass. Not affected by acids. C.c.: 65 silica, 28·7 alumina, and 6·3 lithia. Killiney near Dublin, Uto in Sweden, Tyrol. *Killinite* (sp. 651), from Killiney, seems to be decomposed spodumene.

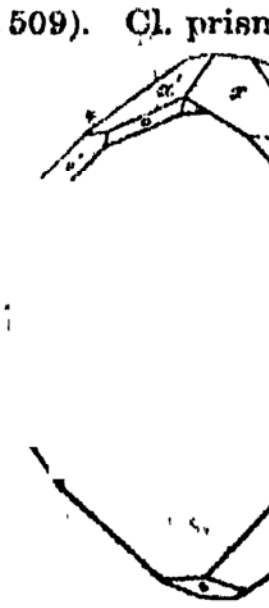

Fig. 509 (sp.

573. Petalite (*Castor*), $4\dot{A}l\dot{S}i_6 + 3(\dot{L}i, Na)\dot{S}i$.

Oblique prismatic. Castor has C 67° 34' and ∞P 86° 20', in irregular rect- angular prisms, petalite being massive and coarse granular. C basal, distinct; in a second

at 141½°) less so. H. = 6·5; G. = 2·4 to 2·5. Greenish, or reddish white to pale red. Translucent; vitreous or B.B. melts easily into a porous obscure glass, colouring red. Not affected by acids. C.c.: 78·3 silica, 17·4 alu- 2 lithia, and 1·1 soda. Utö, Bolton in Massachusetts, Canada. *Castor* in Elba. *Milarite*, valley of Milar, nd.

RHODONITE (*Manganese-Spar*), $\dot{M}n\ddot{S}i$.

ic. $\infty\breve{P}\infty$ (*a*); $\infty P\infty$ (*b*); 0P (*c*); $\infty\breve{P}'$ (*u*); $\breve{P}'\infty$ (*k*); $\breve{P}\infty$ (*s*), $m'\breve{P}'\infty$ (*l*); *a* : *b* 111° 9′; *c* : *a* 93° 28′, *n* : *a* 106° 19′; but assive or granular. and 0P, meeting 8′, perfect; brittle. 5·5; G. = 3·5 to nsluecent; vitreous ly pearly. Dark bluish red, or red- own. Not affected s. B.B. fusible ·8 silica and 54·2 se protoxide, with ne and 0 to 6 iron protoxide. St Marcel, La burg, the Harz, and New Jersey. *Rodonite* or reddish grey, with 14 lime, Mexico; *Fowlerite* ith 7 to 11 iron protoxide; and *Pajsbergite*, Swed *Hydropite*, *Photicite*, *Allagite*, and *Horse-flesh* mixtures.

Fig. 510.

SABINGTONITE, $2(Ca, Fe, Mn)\dot{S}i + Fe\ddot{S}i_3$

ic. Crystals very low eight-sided prisms, small, at 24′; *c* : *a* 87° 27′; *a* : *b* 112° *d* 81° 8′; *c* : *d* 150° 10′ (fig. l. basal (*c*), very perfect; also H. = 5·5 to 6, G. 3·3 to n lamina translucent. Splen reous; black. Not affected by B.B. fuses easily with effervesc- a black magnetic bead. C.c.: a, 11 iron peroxide, 10·3 iron e, 7·7 manganese protoxide, 3 lime, in the Arendal speci- one from Nassau gave about roxide, with protoxides only 11 (Banffshire), Arendal, Nassau and Gouverneur (New

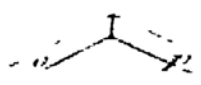
Tongue (Sutherland)

SZABOITE, $11Fe\ddot{S}i_3 + 2Ca\ddot{S}i$.

nic. $\infty\breve{P}'$ (*l*); $\infty'P$ (*m*) 88° 40′; $\infty\breve{P}\infty$ (*n*); $\infty\breve{P}\infty$ (*a*); $\breve{P}'$ (*p*); $\breve{P}\infty$ (*y*); $2\breve{P}'\infty$ (*x*) (fig. 512). H. = 3·5. Brownish red to reddish Pleochroic. C.c.: silica 52·4, pro iron 44·7, lime 3·1. Slightly sol d, more so in h. acid. Calvario on ont Dore.



ANTHOPHYLLITE, $3Mg\ddot{S}i + Fe\ddot{S}i$.

prismatic. ∞P 124° 30′. Cl. agonal, perfect. Clove-brown to brown and leek-green. Trans radiating and foliated. Pearly on . H. = 5·5; G. 3·2. C.c.: silica toxide of iron 16·7, magnesia 27·8 B.B. very difficultly Hillswick, Shetland; Kongsberg and Modum, Norway; nd, and the United States.

HORNBLENDE.

e prismatic (figs. 513 to 517; see also fig. 193). Distinct in several directions. H. = 4 to 6, but generally 5 (will with knife); G. = 2·5 to 4·0, but mostly high. Mostly . Lustre vitreous, in some silky or metallic pearly. Sol very readily, in acids; more or less easily fusible. C.c. us silicates and aluminates of lime, magnesia, iron pro- more sparingly of soda, yttria, and manganese protoxide. ef species form by their decomposition highly fertile

Hornblende.—Oblique prismatic, C 75° 10′. ∞P 124° 30′, P . The crystals short and thick, or long and thin prismatic; especially by ∞P (*m*), $\infty P'\infty$ (*x*), and bounded on the iefly by 0P (*p*) and P (*r*). Twins common, with the s the twin axis. Very often radiated, fibrous, or columnar, ular. Cl. prismatic along ∞P 124°, very perfect; agonal and clinodiagonal very imperfect. H. = 5 to 6, te 3·4. Pellucid in all degrees: vitreous, but sometimes r silky. Colourless or white, but usually some shade of grey, green, brown, or black. B.B. fuses, generally intumescing ling, to a grey, green, or black glass. Those containing most iron are most fusible, and are also partially sol. in which scarcely affects the others. C.c. very variable; th is partly replaced by alumina, specially in the green o varieties; RO is chiefly MgO, CaO, and FeO. Lime is th

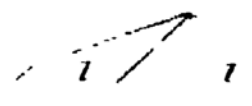

Fig. 514

constant element, m most from 10 to 12; magnesia and iron p replace each other, the one increasing as the other dim With 4Si and R = 2Mg + 1Ca + 1Fe, the average composition thea, 17·8 magnesia, 12·5 lime, and 16·1 iron protoxi

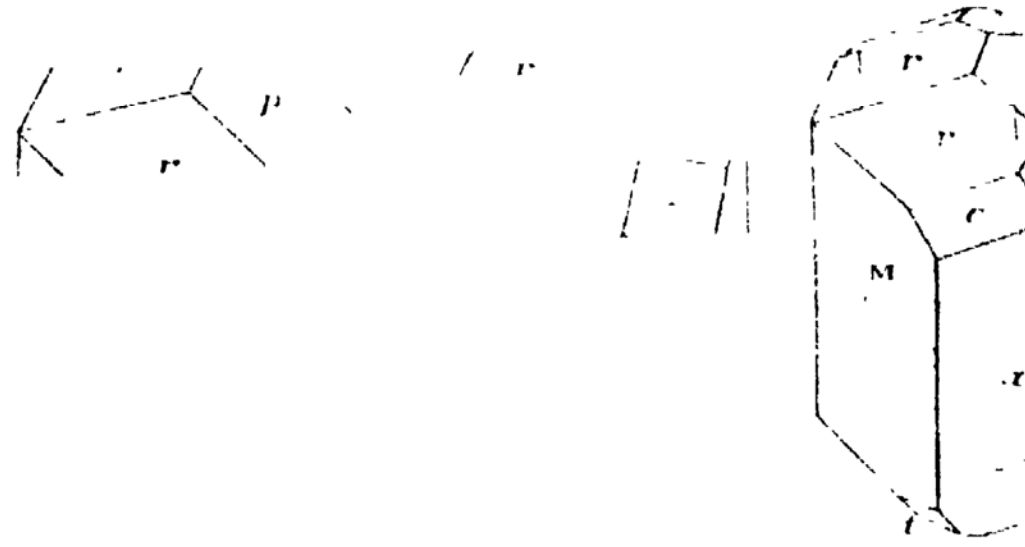

Fig. 515

Fig. 516.

Fig. 517

analyses give 40 to 60 silica, 0 to 17 alumina, 0 to 30 m 10 to 13 lime, 0 to 36 iron protoxide (or peroxide), and manganese protoxide, 0 to 8 soda, 0 to 3 potash, and fluorine with a little water.

The more important varieties are—

Amianthus, *Asbestos*, and *Byssolite*, $2M_2\ddot{S}i + Ca\ddot{S}i$. Fine White, grey, or green. The fibres often easily separable, and flexible. Unst, Shimness, Portsoy, Savoy, Tyrol, Cors

Tremolite, *Grammatite*, $3Mg\ddot{S}i + Ca\ddot{S}i$, with 58·35 silica magnesia, and 13·26 lime. White, grey, green in long p crystals, often striated longitudinally. Pearly or silky transparent or translucent. B.B. fuses easily to a white colourless gla- Loch Shin (Sutherland), Glen Elt, Tyree, Cornwall, Cumberland, Sweden, the Alps, Pyrenees, Siberia, North America.

Nephrite or *Jade*, tough, compact, fine-grained tremol H. = 6 to 6·5, G. = 2·9 to 3·1. Fracture close splintery tenacious. Translucent, dull to vitreous. Leek-green to green. Feels slightly greasy. Formerly made into ring amulets, idols, and war-clubs. New Zealand, China, Mexi Balta (Shetland).

Actinolite, *Asbestus*, or *Strahlstein* (Ca, Mg, Fe) Si green, inclining to black, grey, or brown. Translucent out, or only on the edge. Long prismatic crystals, or columnar masses. B.B. melts to a greenish or blackish Fetlar (Shetland), Colabera and Hillswick (Shetland), Orom Ben (Inverness), Sweden, Tyrol, North America.

Hornblende $nCaSi + R_2Si_3$. Green or black, seldomer grey. G. = 3·1 to 3·4. B.B. fuses rather easily to greenish, or black coloured. Three varieties are distinguish The noble or *Pargasite*, pale celadon- or olive-green, an pearly or vitreous lustre, at Pargas in Finland, Tyree in S Common hornblende, dark leek or blackish green, weak greenish grey. A constituent of many rocks, as in the Alps, and Scottish Highlands (Ballater, Ben Arthu bucket, Colaforbe). (*c*) Basaltic, foliated, with bright even opaque, velvet-black, streak grey or brown. Generally alumina (9 to 15) and much (5 to 11) iron peroxide. In b volcanic rocks. Etna, Vesuvius, Rhineland, Bohemia.

l most mineralogists now take a similar view, regarding se, albite, and anorthite alone as true species, of which the e mixtures. Those consisting essentially of potash and soda mechanical mixtures of orthoclase and albite, the distinct being visible by the microscope; those again that contain ly lime and soda together are, sometimes at least, chemical, omorphous compounds of albite and anorthite in various ons, and with corresponding transitions in crystallographic sical properties. Notwithstanding this, these intermediate regarded as independent mineral species, ina much as they cally typical of certain rocks, and have characteristic forms from each other in angular inclination.

Orthoclase, $\dot{A}l\ddot{S}i_3 + K\ddot{S}i_3$

ne prismatic, $C = 63° 57'$. ∞P (T and l $118° 47'$ $P\infty$ $21° 7'$ (n) $90° 11'$; $21°\infty$ (y) $35° 45'$. The common forms are ∞P, oP, $P\infty$ and $\infty P\infty$ (M), ∞P, oP, P figs. 520 to 527). When ∞P predominates the crystals

Fig. 520.

Fig. 521

Fig. 522.

Fig. 523.

t rhombic prisms; $\infty P\infty$ predominates e tabular; when d $\infty P\infty$ predomiy are short hexaprismatic, when oP $P\infty$ they are rectprismatic, often engthened. Twins ry frequent, and according primarily ar laws. *First*, revolution of one half or of a whole crystal, then forming etrating twins round a vertical axis (fig. 524). In the case hemitropic revolution one of the external faces becomes a union. According as the right or the left half or whole is conceived to be that which has been revolved the crystals ed right and left, as in figs. 183, 189. *Second*, by revolution half around an axis normal to M; in such twins the com is not evidenced externally except by sutures. *Third*,

Fig. 528.

Fig. 529.

Fig. 530.

h revolution round an axis normal to P, forming orthorhombic which show a herring-bone lineation, through the meeting of ommonly present upon the face M parallel to the intersection dge with the face T (fig. 528). *Fourth*, by revolution round normal to $21°\infty$ (n); this also forms a prism the section of is nearly square (fig 529). Compound twins on this last e formed of 3 to 4 and 8 crystals (fig. 530).

rs also massive, and coarse or fine granular. Cl. basal (P), erfect; clinodiagonal (M), perfect ($P : M = 90°$); fracture idal or splintery. H. = 6; G. = 2·53 to 2·58. Transparent slucent on the edges; vitreous but pearly on cl.; and also ent, with bluish or changing colours. Occasionally colourt generally red, yellow, grey, or green. B.B. fuses with difficulty to an opaque vesicular glass. Not affected by acids. 64·6 silica, 18·5 alumina and 16·9 potash, but generally 1 potash, 1 to 4 soda, 0 to 1·3 lime, 0 to 2 iron peroxide. V are:—

(1) *Adularia* and *Ice spar*, transparent or translucent, spl and almost colourless. Some with bluish opalescence are *Moonstone*: St Gotthard, Mont Blanc, Dauphiné, Arendal, land, and Ceylon.

(2) *Common Felspar*, generally white or red, especially fl is a common constituent of many rocks. Crystals at Ba Lago Maggiore, Pommitz in Silesia, Monzoni Mountains and low in Ireland, Aberdeenshire (at Rubislaw 6 or 8 inches Scotland and at Carlsbad and Elnbogen in Bohemia. *Sunstone*, verdelite-green, from Sutherland, L. Le Huron, and C and *Murchisonite* golden or greyish yellow, from Arran and I are varieties.

(3) The *Glassy Felspar* or *Sanidine* ($C = 64° 4'$, ∞P 119° tains 3 to 12 potash and 3 to 10 soda. Crystals and vitreous, transparent, and often much cracked, Arran, Ea other parts of Scotland, Drachenfels, Auvergne, and other co

Orthoclase occurs in granite, gneiss, and porphyry m country. It is commonly associated with quartz, sometim in the *Granite Gneiss* of Sutherland. Hurlet, and Port letter like combination of the latter. It is very liable to d position, when it is converted chiefly into Kaolin, a manufacturing porcelain and stoneware. The adularia or stone and the green amazon-stone are cut as ornamental *Leaks*, from Baldoran near Banff in Aberdeenshire and Grythy Sweden, is a somewhat obscurely banded variety of the bluish-coloured pearl variety. *Perthite* and *Hoganite* are similar but more *Microcline* is a variety with angle distorted by interstitial p tion, by oligoclase Sutherland, and by albite Frederiksvar

590. Albite, $AlSi_3 + NaSi$.

Anorthic. oP (P), $\infty P'$ (M) $86° 24'$, ∞P (T), ∞P (l) but angles variable. Crystals, generally like those of or are tabular or prismatic (fig. 197). Hemitropes common, united by a face of $\infty P\infty$ (figs. 531, 532) the re-entering a

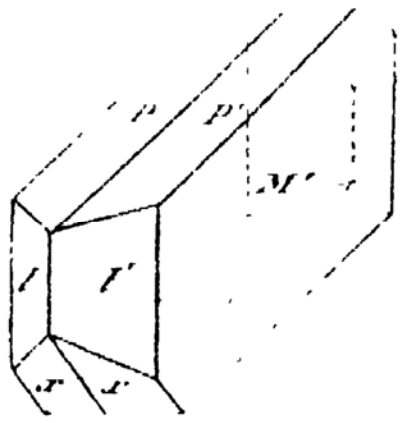

Fig. 531

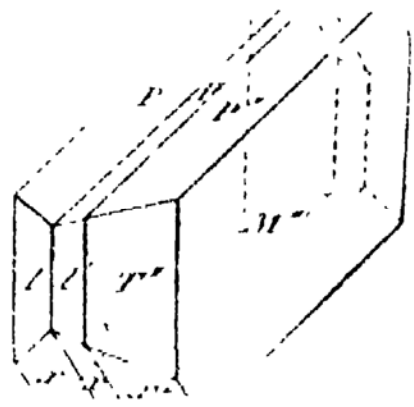

Fig. 532

tween the faces of oP (P and P') $17°$. Is hence very charac Fig. 19 is another common hemitrope. Massive, and r ing plates. Cl. basal and brachydiagonal, distinct; fracture conchoidal or uneven. H. = 6 to 6·5. G. = 2·6 Rarely transparent, vitreous, pearly on the cl. Colourless, generally white, grey, red, or yellow, rarely white

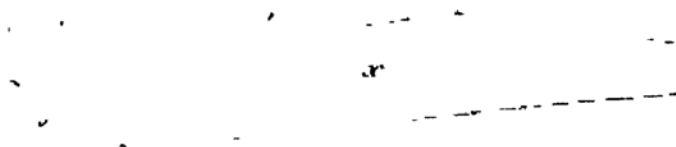

Fig. 533

difficultly fusible, tinging the flame yellow, to a white semi-opaque glass. Not affected by acids. 68·6 silica, 19·6 alumina with 0·1 to 1 iron peroxide, and 11 soda with 0·3 to 1 lime, 0 to 2·5 potash. Hence albite and orthoclase both soda and potash only in different proportions. Albite easily recognized by its frequent re-entering angles, its fusibility, and the obliquity ($86° 30'$) of its cleavage planes, often with striæ. *Peristerite* is a variety of which fig. 533 is a form.

Albite is a constituent of many "green stones," as at Corstorphine, Edinburgh, and of granite, syenite, gneiss, porphyry, and t Crystallized at Minnock's Cairn, Aberdeen, to form the felspar of the red granite of Scotland. Dauphiné, St G Tyrol, Salzburg, and Arendal.

Albite is a compact variety, similar in appearance to *J*

591. Anorthite, $AlSi + CaSi$.

Anorthic. oP (P) : $\infty P'$ (M) $85° 50'$, $\infty P'$ (l), ∞P $30'$. Hemitropes common on both M and l. Angle between l and l' $180° 24'$. Cl. basal and brachydiagonal, perfect

to 2·78 Transparent or translucent; vitreous. Colourless or B.B. fuses to a clear glass; soluble without gelatinizing in acid. C.c.: 43 silica, 36·9 alumina, 20·1 lime, sometimes

ima, &c.

CELADONITE. $Mg_2Si_3 + 2H$.

hohedral, R 120° 12′. OR; ∞R. Earthy habit, and in
aggregates. Cl basal, perfect. H. 1 to 2. G. 2·1. Rose-
pale green streak. Colour due to silica 56, protoxide of manganese 53,
5, water 7·9. Adervielle on the N.E. of Lez on the Pyrenees.

Hydrous Silicates of Alumina

are probably for the most part products of decomposition
under atmospheric exposure.

ALLOPHANE (*Porcelain Earth*, $AlSi_3 + 2H$.

e; in beds and veins. Fracture uneven, luster earthy, very
le, and friable. H. 1, G. 2·2. Opaque, dull. White or
hing to blue, green, yellow, or red. Feel meagre, not
hen dry, and plastic when wet. B.B. infusible.
by hydrochloric acid, but decomposed by warm sulphuric acid, leaving silica
variable, but approximately to 46 silica, 40 alumina, and
Chiefly a product of the decomposition of orthoclase, or
te, porphyry, and other rocks containing that mineral.
and Devonshire in England are the chief European localities
ey is largely used in manufacturing porcelain.

ordinarily varieties of kaolin, mixed with quartz sand, car-
e of lime, magnesia, and ferrous hydrate of iron. Often 40
ina, 13 to 20 water, and 1 iron peroxide,
ent proportions. In the fire they are infusible, burning
ome cases, very compact and friable, of white, yellow,
, or various other colours. Their specific gravity varies
to 2·7. The following are varieties. *Pipe clay*, greyish
with white, greasy feel, adheres strongly to the
when wet, bakes and contracts, and in the fire
white. Abundant in Devonshire and in the Trough of
Dorset-here in large beds. Bohemia, and Germany. Used
manufacturing tobacco-pipes and similar articles. *Potter's*
d, yellow, green, or blue, becoming yellow or red when
more easily fused than the former, and often effervesces
ds. That used in the potteries in England comes chiefly
evonshire. *Loam*, coarser and more impure, with more
d consequently less plastic. *Shale* or *Slate Clay*, grayish
and much mixed with bituminous or carbonaceous
Bituminous Shale, known by its burning resinous streak
Bath, with more carbon, leaves a black mark on paper. *Iron*
Clay contains much peroxide of iron, is reddish-brown, and
the basis of many amygdaloids and porphyries.

630. NACRITE, $Al\dot{S}i_2 + 2\dot{H}$.

Right prismatic; minute six-sided tables in fan-like group
scaly. H. = 0·5 to 1; G. = 2·35 to 2·6. Glimmering to pearly,
white or yellowish white. C.c.: silica 46·3, alumina 39·8,
13·9. A crystalline form of kaolin. Fins in Allier, Mons, Fre
Pennsylvania, and coal formation commonly.

631. LITHOMARGE.

Kaoline substances, compact, earthy, and pseudomorp
H. 2·5 to 3, G. = 2·4 to 2·6. White, yellow, or red. Greasy, a
to tongue. Klausthal, Harz, &c. Similar are *Carnat*, *M*
Meloposite.

632. HALLOYSITE, $Al\dot{S}i + 4\dot{H}$.

Massive and reniform. H. = 1·5 to 2·5; G. = 1·9 to 2·1.
lucent when moist. Bluish white, green, or yellow. C.c.: 41·5
34·4 alumina, 24·1 water. Hospital Quarry near Elgin, C
Tweed, Liége, Tarnowitz, Eitel (*Lenzinite*). *Fuller's Earth* m
an impure ferruginous variety. Maxton in Scotland, Reigat
Maidstone in England, Saxony, Bohemia, &c.

633. GLAGERITE, $Al_2Si_3 + 6\dot{H}$.

H. 1, G. 2·3. Bergenerseuth. *Malthazite*, from Stein
near Bautzen, has less alumina.

634. KOLLYRITE, $Al_2Si + 9\dot{H}$.

H. 1 to 2, G. 2. Also similar. Schemnitz, Pyrenees
Saxony. *Scarbrite* from Scarborough has $10\dot{H}_2O$.

635. MILOSCHITE.

Conchoidal or earthy. H. 2; G. 2·1. Indigo-blue to ce
green, has 2 to 4 chrome oxide. Rudnik in Servia.

636. MONTMORILLONITE, $Al\dot{S}i_2 + 2\dot{H}$.

Massive. Rose-red. Montmorillon and elsewhere in F
Podhrancz in Transylvania.

637. RAZOUMOFFSKINE, $Al\dot{S}i_2 + 3\dot{H}$.

From Ormethy. *Chrome Ore*, with 2 to 10 per cent. of c
oxide, from Waldenburg in Silesia and Creusot in France, is si

638. CIMOLITE. $Al\dot{S}i_2 + 6\dot{H}$.

Pseudomorphous after augite. Bilin, Limburg, Kaiser
Argentiera and Milo.

639. ALLOPHANE, $Al\dot{S}i + 5\dot{H}$.

Botryoidal and reniform. Fracture conchoidal, brittle. I
G. 1·8 to 2. Pellucid: vitreous. Pale blue, white, gre
brown. Colour due to copper. Charlton, Woolwich, Bade
Bonn.

640. PYRODMALITE, $Al\dot{S}i_4 + \dot{H}$.

Right prismatic, but radiated, foliated. Cl. perfect; fle
ectile. H. 1, G. 2·8 to 2·9. Translucent, pearly. Light
ous green to yellowish white. B.B. swells up with many twi
to a white infusible mass. C.c.: 67 silica, 28 alumina,
water. Upsala Spa, Morbihan, Westana in Sweden, Carolin
Brasil. *Tuesite*, from Heathcote in Victoria, has silic
alumina about equal.

641. ANAUXITE, $Al\dot{S}i_4 + 3\dot{H}$.

Granular. H. 2 to 3; G. 2·2 to 2·4. Translucent,
Greenish white. C.c. 60·5 silica, 26 alumina, and 13·5
Bilin in Bohemia.

Hydrous Silicates of Zirconia, Thoria, &c.

642. MALACONE, $3Zr\dot{S}i + \dot{H}$.

Pyramidal. P 83° 30′. Typical form ∞P∞, P, ∞P. I
G. = 3·9 to 4·1. Conchoidal fracture. Lustre vitreous. C.c
carbon, but with 3 of water in the Hittero variety and ov
alt from Finland. Has a surface opalescence, and may be
green. Hittero, Chantelouhe near Limoges, near Dresden,
dal, Finland, Miask.

643. ERDMANNITE.

Right prismatic (?). H. 4·5 to 5; G. = 4·39. Lustre
Bluish brown, streak brown. Translucent on edges. Fr
uneven, brittle. C.c. very complex: silica 16, thoria 36,
protoxide 5·6, peroxide 6, lanthania 2·4, yttria 4·3, erbi
titanic acid 1·3, ferric oxide 1·25, alumina 1·8, water 9. Ba
near Brevig.

644. THORITE, $Th\dot{S}i + 2\dot{H}$.

Pyramidal. ∞P : P 133° 30′. Generally massive. H
to 5. G. = 5 to 5·4. Lustre brilliant vitreous; when wea
resinous. Fracture conchoidal when fresh, splintery
weathered. Brownish black to clove-brown. C.c. comple
essentially 18 silica, 73 thoria, 9 water. In syenite at L

Hacon, and in a boulder on Ben Bhreck in Sutherland, in crystals (fig. 585); Löwö near Brevig, Norway. *Uranothorite*, from Arendal, has 50 per cent. thoria and 10 uranous oxide; found also at Hitterö and at Champlain (U. S.)

Fig. 585 (1/1).

645. Orangite, $3\dot{T}h\ddot{S}i + 2\dot{H}$.

Massive. Orange-yellow to cinnamon-red. Other characters like thorite. C.c.: 17 silica, 75 thoria, 7 water. Ben Bhreck, Langesund near Brevig. The mineral from Ben Bhreck passes gradually into thorite, which thus would appear to be altered orangite.

646. Tritomite, $\dot{R}_2\ddot{S}i_3 + 4\dot{H}$.

Cubic. In tetrahedra. H. = 5·5; G. = 3·9 to 4·66. Lustre vitreous. Dull brown; streak yellowish grey. Subtranslucent. C.c. complex: silica 21, alumina 2·5, ceria 40, lanthana 15, yttria 4·6, lime 4, water 8. Lamö near Brevig.

Magnesian Silicates.

647. Agalmatolite (*Figure Stone*), $4\dot{A}l\ddot{S}i + K\ddot{S}i_3 + 3\dot{H}$.

Massive or slaty. Fracture splintery, rather sectile. H. = 2 to 3; G. = 2·8 to 2·9. Translucent; glimmering. Green, grey, red, and yellow. Feels somewhat greasy, but does not adhere to the tongue. Sol. in s. acid. C.c.: 55 silica, 33 alumina, 7·6 potash, and 5 water; but in many localities magnesian. Callgang in Sutherland, China, where it is cut into various work. Unkel, also Nagyag in Hungary, and Saxony.

648. Oncosin, $2\dot{A}l\ddot{S}i_2 + (\dot{K}, \dot{M}g)\ddot{S}i + 2\dot{H}$.

Fracture uneven or splintery; sectile. H. = 2; G. = 2·8. Translucent; slightly resinous. Apple-green or brown. Sol. in s., not in h. acid. Salzburg.

649. Liebenerite.

Hexagonal. ∞P; $0P$. Cl. prismatic, perfect, fracture hackly. H. = 3·5; G. = 2·8. Oil green, bluish green, and greenish grey. Greasy lustre. C.c.: silica 44·7, alumina 36·5, potash 9·9, water 5·5. Monte Viesena near Forno, Predazzo in Tyrol.

650. Giesekite.

Hexagonal. ∞P; $0P$. Fracture splintery. H. = 3 to 3·5; G. = 2·7 to 2·9. Kangerdluarsuk in Greenland. Diana in New York.

651. Killinite, $2\dot{A}l\ddot{S}i_2 + R\ddot{S}i_2 + 3\dot{H}$.

Crystalline, foliated. Cl. along a prism of 155° 11′. G. = 2·65. Greenish grey, yellow, or brownish green. C.c. 48 silica, 31 alumina, 2·3 protoxide of iron, 6·5 potash, 10 water. Killiney near Dublin.

652. Hydrophilite.

Scaly. H. = 2 to 2·5; G. = 2·7. Greenish grey. Lustre and feel greasy. C.c.: silica 48·4, alumina 32·1, protoxide of iron 3·3, potash 5·7, water 9. Sol. in h. acid. Halle on the Saale.

653. Bravaisite, $\dot{R}_2\ddot{S}i_3 + 2\dot{A}l\ddot{S}i_3 + 4\dot{H}$.

Aggregates of thin plates. H. = 1 to 2; G. = 2·6. C.c.: silica 51·4, alumina 18·9, peroxide of iron 4, magnesia 1·3, potash 6·5, water 13·3. Noyant in Allier.

654. Pinitoid.

Massive. Leek- and oil green. H. = 2·5; G. = 2·8. C.c.: silica 48·5, alumina 28, protoxide of iron 3, potash 5·8, water 4·5. Freiberg and Chemnitz in Saxony.

655. Bole.

Earthy, in nests and veins. Conchoidal. H. = 1 to 2; G. = 2·2 to 2·5. Opaque; dull resinous; streak shining. Brown, yellow, or red. Feels greasy; some adhere strongly to the tongue, others not at all. In water crackles and falls to pieces. C.c. hydrous silicates of alumina and iron peroxide, in various proportions. Scotland, Ireland, Dransfeld, Clermont in Auvergne. *Stolpenite*, *Red Soap*, *Plinthite*, *Yellow Earth* or *Felinite*, *Fettbol*, and *Ochran* are varieties.

656. Carpholite, $\dot{A}l\ddot{S}i + \dot{M}n\ddot{S}i + 2\dot{H}$.

Right prismatic. P 111° 27′. Radiating stellated. H. = 5 to 5·5; G. = 2·9. Translucent; silky; straw- to wax-yellow. B.B. intumesces and fuses to an opaque brown glass. C.c.: silica 38, alumina 29·4, protoxide of iron 2·9, peroxide of iron 4, protoxide of manganese 11·8, water 10·8. Schlaggenwald, Wippra in the Harz, Monville in the Ardennes.

657. Nontronite, $\dot{F}e\ddot{S}i_3 + 5\dot{H}$.

Massive; fracture uneven. H. = 2 to 3; G. = 2 to 2·3. Opaque; dull or glimmering; streak resinous. Straw-yellow or siskin-green. B.B. decrepitates, becomes black and magnetic, but without fusing; sol. and gelatinizes in warm acids. C.c.: 43 silica, 36 iron p and 21 water, with 3·5 alumina and 2 magnesia. Nor France, Harz, and Bavaria. *Chloropal* is similar. B.B. Unghvar in Hungary, and Passau.

658. Pinguite.

Massive; fracture splintery; sectile. H. = 1; G. = 2·3. dark green. Lustre vitreous. Feels greasy. C.c.: silica 30 oxide of iron 29·5, protoxide of iron 6·1, water 25·1. Wolk Suhl.

659. Hisingerite, $Fe_2\ddot{S}i_3 + 2\dot{F}e\ddot{S}i + 9\dot{H}$.

Reniform, and in crusts. H. = 3·5 to 4; G. = 2·6 to 3. resinous. Brownish or bluish black; streak liver-brown or y brown. C.c. various, but 32·5 silica, 33·5 iron peroxi iron protoxide, and 19 water, in the *Thraulite* from Bod Also Gilling and Riddarhyttan in Sweden, and Brett (*Polyphyllite*).

660. Bucholz.

Fine fibrous, glimmering lustre. Wood-brown to green. C.c. silica 55·5, peroxide of iron 19·5, magnesia 15, wat Stenzing in Tyrol. *Velite*, probably from the Urals, is sim

661. Umbite.

Massive; fracture conchoidal. H. = 1·5, G. = 2·2. Liver streak shining. Mixtures of peroxide of iron, oxide of man and alumina with water. Cyprus. *Hapsonanthite* and *Si* similar.

662. Kittelite, $(R_6\ddot{R}_4\ddot{S}i_9 + R_2\dot{H}_2)$.

Compact. H. = 5 to 5·5, G. = 3·5. Liver brown to black yellow brown. C.c.: silica 25, peroxide of iron 4, sesqui manganese 57, water 9. Klappernd in Dalecarlia, Herbo Dillenburg.

663. Wolkonskoite.

Amorphous. Horny, bluish green to grass green. Fract choidal, brittle. C.c. silica 36, alumina 3, sesquioxide of ch 19, ferric oxide 10, water 21. Okhansk in Siberia.

664. Rötticite, $3\dot{N}i\ddot{S}i + 4\dot{H}$.

Amorphous and reniform. Apple-green to emerald green to 2·5; G. = 2·35 to 2·37. C.c. silica 43·7, nickel oxide 35· 11·2. Rotts near Reichenbach in Saxony. *Konarit* is si

665. Uranophane, $3\dot{C}a\ddot{S}i + \dot{U}_2\ddot{S}i_3 + 4\dot{H}$.

Right prismatic. ∞P 146°, $\infty P\infty$, $P\infty$; with polar an Crystals honey yellow, when massive leek-green. H. = 2 2·6 to 2·8. C.c. silica 17, alumina 0·1, oxide of uranium lime 5·1, water 15·1. Kupferberg in Silesia.

666. Uranotile, $\dot{C}a\ddot{S}i + 4\dot{U}_3\ddot{S}i_2 + 9\dot{H}$.

Right prismatic. ∞P 164°. In stellate groups. Lemon G. = 3·96. C.c. silica 13·8, oxide of uranium 66·75, hy water 19·67. Wolsendorf in Bavaria, Joachimsthal, Mitche in North Carolina.

667. Bismutoferrite, $\dot{B}i_2\ddot{S}i_3 + 2\dot{F}e_2\ddot{S}i$.

Crypto-crystalline; oblique prismatic. Straw to olive H. = 3·5; G. = 4·18. C.c.: silica 24, oxide of bismuth 42·8, of iron 33·1. Schneeberg. *Hypochlorite* is a containing 13 of bismuth. In a third variety, from Bra antimony replaces bismuth.

Silicates with Titanic, Niobic, &c.

668. Sphene, $\dot{C}a\ddot{S}i_2 + \dot{C}a\ddot{T}i$.

Oblique prismatic, C. So. 22°. ∞P (*l*) 133°2′; $\frac{1}{2}P\infty$ 21′; $P\infty$ (*u*) 31° 21′, $\infty P\infty$ (*q*) 61°, *l* on *l* 90°; $\infty P3$ (*M* $P\infty$ (*r*) 113° 30′, $P\infty$ (*o*) 136° 12′; 41°4 (*s*) 67° 57′. vary extremely in form, being generally apparently oblique-tabular, from predominance of *n*, which are hemihedral in alternate position on opposite ends, also, but rarely, pre ite, the dominance of *l* and *M*. Twins frequent. Twin face and formed by revolution either (*a*) on an axis normal to (or *b*) on a vertical axis, the former very common and usually produces thin tables with re-entering angle along one side, and sometimes elongated. Occasionally in double twins. Sometimes granular or foliated. Cl. in some (*l*), in others (*r*). to 5·5, G. = 3·4 to 3·6. Semitransparent; adamantine or

677. Arrhenite.

Right prismatic. ∞P 131° 2′, P∞ 112° 24′; P⅔; ∞P⅔; ∞P∞ ∞P∞ crystals like elvanite. Cl. brachydiagonal ∞P. H 6·5 to 7. G 3·62. Yellow to yellow brown. Die brittle. C.c.: silica 47·8, alumina 21, protoxide of manganese lime 2·2, magnesia 1·3, vanadic acid 5·2, arsenic acid 6·3, wa Office in the Ardennes (Luxemburg).

678. Rowlandite.

Foliated masses, sometimes stellated. H. = 1; G. = 2·3 1 Dark green to greenish blue. Pearly lustre. C.c.: silica vanadic acid 22, alumina 14·1, magnesia 2, potash 7·6, wa Lidorado in California.

TITANATES WITH NIOBATES.

679. Titanomorphite $CaTi_2$.

Oblique prismatic. Like sphene. ∞P, 0P, ½P∞, P∞2. C.c.: titanic acid 74·3, lime 25·3. Lampersdorf in S Wermland.

680. Perowskite $CaTi$.

Right prismatic. In complicated twins, often distorted, p cubic. H. = 5·5; G. 4·0 to 4·1. Lustre metallic- adamantine. Pale yellow, reddish brown to iron-black, streak grey. C.c.: 58·8 titanic acid, 41·2 lime. B.B. with micro-salt in outer flame gives a bead greenish while hot, colour- less on cooling, in inner flame grey green when hot, violet blue when cold. Decomposed by boiling h. acid. Ziatoust, Schelingen, Zer- matt, Maderno Valley near Sondrio, Pfitsch in Tyrol, Magnet Cove in Arkansas.

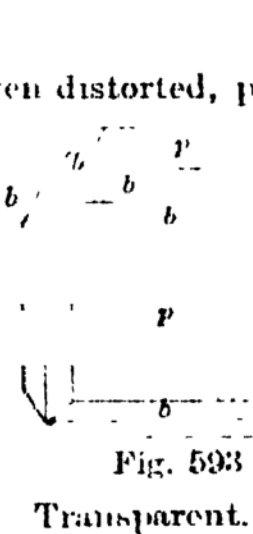

Fig. 593

681. Koppite $R_2Nb_2O_7$.

Cubic; ∞O∞. G. 4·45 to 4·56. Brown. Transparent. niobic acid 69·46, oxide of cerium 6·7, oxide of lanthan Schelingen on the Kaiserstuhl in Baden.

682. Annerodite $2R_2Nb_2O_7+5H_2O$.

Light prismatic. H 6. G 3·57. Metallic to greasy. Streak black, brown, greenish grey. Translucent in spl brittle. C.c.: 48 niobic acid, with zirconia, thoria, ceria, and uranium oxide. Amherst near Moss (Norway).

683. Dysanalyte, $6\dot{R}Ti+R\dot{N}b$.

Cubic, ∞O∞. Cl cubic. G. 4·13. Black. C.c.: titan 41·5, niobic acid 23·2, cerium oxide 5·7, lime 19·8; proto iron 5·8, soda 3·6. Vogt Isarg on the Kaiserstuhl.

684. Pyrochlore, $5\dot{R}Nb+4R(\dot{T}i\dot{T}h)_2+4NaF$.

Cubic (fig. 594). Cl octahedral; brittle; fracture conc H 5; G 4·2 to 4·4. Resinous, opaque. Red brown to black, ruby red and transparent rarely; streak pale brown. C.c.: niobic acid 53·2, titanic acid 10·5, thoria 7·6, iron oxide 7, lime 11·2, soda 2, fluorine 7·1. Black, Kaiser stuhl, Brevig, and Frederiksvarn. *Hatchettolite* from Chesterfield in Massachusetts, has tantalic acid 68·4, niobic acid 7·75, 11·7 lime 7·7 protoxide of manganese. *Dysanalyte* from Miask in the Urals, San Piero in Elba, and the Azores may be the same; at the last locality it is in orange-red octahedra, and is a niobate of zirconia.

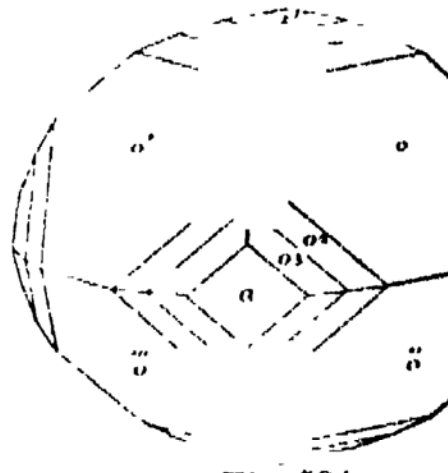

Fig. 594.

685. Bromstrandite, $(Ca,Fe)_3\dot{T}i_4\dot{U}\dot{N}b_2+\dot{H}$.

Massive. H = 5·5. G. = 4·17 to 4·25. Vitreous, black.

Translucent in splinters. C.c. niobic acid 49·8, titanic ·7, uranium oxide 23·7, protoxide of iron 3·3, lime 3·5, 9. Nohl (Sweden).

POLYCRASE, $4\dot{R}\ddot{T}i + R\ddot{N}b$.

prismatic (fig. 595). $\infty\breve{P}\infty$, ∞P P, $2\breve{P}\infty$ (56′). Fracture conchoidal. 6; G. = 5·1. Black; streak grey. B.B. decrepitates violently, mean- but does not fuse. Sol. in s. acid anic acid 26·6, niobic acid 20·4, yttria a 7·5, oxide of uranium 7·7, water tero (Norway), Slettäkra in Jonkop- den).

Fig. 595.

EUXENITE, $2R\ddot{T}i + R\ddot{N}b + H$

prismatic (fig. 596). ∞P (m) 140°,), $2\breve{P}\infty$ (d) 52°; P (p) 102° 58′, ° 6′. Fracture conchoidal. Opaque to vitreous. Black and brownish reak red brown. B.B. infusible. Not by acids. C.c.: niobic acid 32, cid 19·2, uranium oxide 19·3, yttria erium oxide 2·8, but variable

Fig. 596.

Tromo, Alvo, &c., in Norway; also and Cape Lindesnaes.

ESCHYNITE.

prismatic. ∞P (M) 128° 34′, $2\breve{P}\infty$ (o) 73° 16′, P ; $\infty P3$ 69° 23′; $P\infty$; $0P$. Crystals long prismati (fig l. traces; fracture imperfect conchoidal 5·5; G. = 4·9 to 5·1. Opaque, submetallic ous. Iron-black or brown, streak yellow vn. B.B. swells and becomes yellow or but is infusible. Not sol. in h. acid, in s. acid. C.c.: niobic and tantalic acids ane acid 22·6, thorium oxide 15·7, cerium e 18·5, lanthanum oxide and didymium 6. Miask, Hitterö.

POLYMIGNITE.

prismatic. P (p) polar 136° 28′ and 116° 22′; ∞P 109° 46′, $\breve{P}\infty$, $\infty\breve{P}\infty$ (fig. 598). Cl. a and brachydiagonal imper fect; fracture conchoidal. H. = 6·5, G. = 4·7 to 4·8. Opaque; semimetallic. Iron-black, streak dark brown. B.B. infusible. Sol. in h. acid. C.c.: titanic acid 46·3, zirconia 14·1, yttria 11·5, lime 1·1, iron peroxide 12·2, cerium oxide 5. Frederiksvärn.

Fig. 598 (sp. 689).

or reddish brown. B.B. infusible, not affected by acids isomorphic mixtures of niobic and tantalic acid with prot iron or manganese. Pure columbite would give 78·8 nio pure tantalite 86 tantalic acid. The niobic acid generally and the crystals are better formed the more this is t Rabenstein, Bodenmais, Chanteloube, Finland, Ilmen Evigtok in Greenland, Haddam and Middletown in Conn Acworth in New Hampshire, Pike's Peak in Colorado.

691. YTTROCOLUMBITE (Y, Ca, Fe, U)(Ta, W, Nb).

In two varieties. *a. Black.* Riche prismatic, in sh matic or tabular crystals. $\infty\breve{P}\infty$, ∞P (a) 121° 48′ 0P 103° 26′, $P\infty$ 0P 131° 26′, a : a 149° 42′ (fig. 601), also in grains and lamella Cl. brachydiagonal, indistinct, fracture conchoidal or uneven. Opaque, or in thin splinters translucent. Velvet black to me tallic lustre, and greenish grey streak. H. = 5·5, G. = 5·4 to 5·7. *b. Yellow.* Amorphous, yellowish brown, or yellow, often striped or spotted; remnants of vitreo us; streak white. G. = 5·46 to 5·88. Both varieties B.B. infusible, but become brown or yellow. Not affected by acids. C.c.: 57 to 60 tantalic acid, 1 to 8 tungstic acid, 0 to 2 acid, 20 to 38 yttria, 0·5 to 6 lime, 0·5 to 6 uranium p and 0·5 to 3·5 iron peroxide. Ytterby, and near Falun.

695. FERGUSONITE, (Y, La, Ce)(Nb, Ta)

Pyramidal and hemihedric. P (o) 128° 28′. Usual form (o), P, $\frac{1}{2}\breve{P}$ (a_2), $0P$ (c; fig. 605). s : s 100° 54′, s : o 115° 16′, o : o 169° 17′. Cl. traces along P, fracture imperfect conchoidal, brittle. H. = 5·5 to 6, G. = 5·8 to 5·9. Translucent in thin splinters, semimetallic. Brownish black; streak pale brown. B.B. infusible. C.c.: chiefly niobic acid and yttria, with erbia, also a little cerium protoxide, tin oxide, uranium oxide, and iron protoxide. Cape Farewell in Greenland, Ytterby, Riesengebirge, Rockport in Massachusetts. *Tyrite*, from Helle near Arendal, is similar.

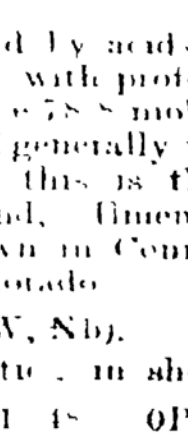

Fig. 605.

696. ALLANITE.

Massive, with granular fracture and traces of crystals. H. = , G. = 3·82. Velvet black; streak black. Lustre metallic. C.c.: tantalic acid 62·4, tin 6·6, 1·9, protoxide of iron 8·1, yttria 5·2. B.B. infusible tube decrepitates and yields water. Karafvet near Falun

697. SAMARSKITE (*Uranotantalite*), $(R_2R, R'_2)_3(Nb_2Ta)_3$.

Right prismatic. ∞P 122° 46′, $\breve{P}2$ 95°, $P\infty$ 94°, P, $\infty\breve{P}\infty$, $3\breve{P}_3$, also in grains. Fracture conchoidal; brittle 5·56; G. = 5·6 to 5·76. Opaque, strong semimetallic. black, streak dark reddish brown. B.B. fuses on the e black glass. In the closed tube decrepitates, yields wate desces, and becomes brown. Sol. in h. acid to a greens

Massive Velvet-black. Adamantine lustre; brittle.
carbon 86, hydrogen 9, nitrogen 2·9, oxygen 2. Hoy, Ork
Strathpeffer, Ross; Hillsborough, New Brunswick.

711. PIAUZITE.
Massive, imperfect conchoidal, sectile. H. = 1·5; G. =
Dimly translucent on very thin edges; resinous. Blackish br
streak yellowish brown Fuses at 600° Fahr., and burns wi
aromatic odour, lively flame, and dense smoke. Sol. in ethe
caustic potash. Priuze near Rudolfswerth in Carniola.

712. IXOLYTE
Massive, conchoidal fracture. H. = 7; G. = 1·008. Resi
Hyacinth red; streak ochre yellow. Rubbed between the fi
it emits an aromatic odour; becomes soft at 119°, but is
viscid at 212°. Oberhart near Gloggnitz in Austria.

713. AMBER (*Succinite*), $C_{10}H_8O$.
Round irregular lumps, grains or drops. Fracture perfect
choidal, slightly brittle H. = 2 to 2·5; G. = 1 to 1·1. Transp
to translucent or almost opaque, resinous. Honey-yellow, hyac
red, brown, yellowish white; also streaked or spotted. V
rubbe ·ble odour, and becomes negatively ele
It melts at 550°, emitting water, an empyreumatic oil, and suc
acid; it burns with a bright flame and pleasant odour, leav
carbonaceous remainder, only a small part is soluble in alc
C·c: 79 carbon, 10·5 hydrogen, and 10·5 oxygen. Derived f
from an extinct coniferous tree (*Pinites succinifer*), and f
in the Tertiary and diluvial formations of many countries, espe
northern Germany and shores of the Baltic, Sicily, Spain,
northern Italy, rarely in Britain (on the shores of Fife, Nor
Suffolk, and Essex, and at Kensington, near London). Use
ornamental purposes, and by preparing succinic acid and
nishes. *Krantzite*, from Nienburg, is essentially the same.

714. RETINITE (*Retinasphalt*).
Roundish or irregular lumps, fracture uneven or concho
very easily frangible H. = 1·5 to 2; G. = 1·05 to 1·15. T
lucent or opaque resinous or glistening Yellow or brown.
at a low heat, and burns with an aromatic or bituminous o
C·c in general carbon, hydrogen, and oxygen, in very
certain amount Bovey, Halle, Cape Sable, and Osnab
Fuscotinite from Aussig in Bohemia is similar.

715. WALCHOWITE, C_3H_2O.
Rounded pieces, with a conchoidal fracture. H. = 1·5
G. 1·035 to 1·069. Translucent, resinous. Yellow with b
stripes, and a yellowish white streak. It fuses at 482°, and b
readily. Soluble partially (7·5 per cent.) in ether; in s. acid f
a dark-brown solution. C.c. 80·4 carbon, 10·7 hydrogen,
8·9 oxygen Walchow in Moravia.

716. COPALINE (*Fossil Copal, Highgate Resin*), $C_{40}H_{64}O$.
Irregular fragments H. = 1·5; G. = 1·046. Translucent, resi
burns with light yellow flame and much smoke; alcohol diss
little of it, becomes black in sulphuric acid. C.c.: 85·54 ca
11·63 hydrogen, 2·76 oxygen. Highgate near London. A si
resin from Setting Stones mine in Northumberland, found i
drops or crusts on calc-spar, is infusible at 500° Fahr.; G. = 1·
1·51, it contains 85·13 carbon, 10·85 hydrogen, and 3·26 ash

717. BUCHOLZITE, $C_{40}H_{62}O_8$.
Amorphous; conchoidal fracture. Dark brown, inclinin
green, yellow streak. Resinous; unpleasant odour, and b
taste Fuses below 212°, and continues soft afterwards at ord
temperatures; easily soluble in alcohol. C.c.: 72·40 carbon,
hydrogen, 18·31 oxygen. San Juan de Berengela in Peru.

718. GUAYAQUILLITE, $C_{20}H_{26}O_3$.
Amorphous; yielding easily to the knife, and very friable.

2. Pale yellow. Slightly resinous. Fluid at 212°, viscid old; slightly soluble in water, and largely in alcohol, forming w fluid with a bitter taste. C.c.: 77·01 carbon, 8·18 hydro- nd 14·80 oxygen. Guayaquil in South America.

utter, from the Irish peat mosses, is similar: it melts at s easily soluble in alcohol, and contains 73·70 carbon, 12·50 en, and 13·72 oxygen.

HARTINE, $C_{20}H_{20}+H$.

nd masses or thin layers. Brittle, but easily cut with a G. = 1·6. Resinous. Reddish brown by reflected and deep transmitted light; streak light brown. Becomes black on re. C.c.: 86·43 carbon, 8·01 hydrogen, 5·56 oxygen. In in coal seam at Middleton near Leeds, and at Newcastle

OZOCERITE (*Native Paraffin*), CH.

rphous, sometimes fibrous. Very soft, pliable, and easily ed with the fingers. G. 0·94 to 0·97. Glimmering or ng; semitranslucent. Yellowish brown or hyacinth red by itted, dark leek-green by reflected light. Strong paraffin matic odour; fuses easily to a clear oily fluid, at higher ature burns with a clear flame, seldom leaving any ashes, soluble in oil of turpentine, with great difficulty in alcohol r. C.c.: 85·7 carbon, and 14·3 hydrogen. Brora (Sutherland Edinburgh: Slanik and Zietrisch in Moldavia; near g in Austria, and Baku: also at Urpeth coal mine near tle-on-Tyne. *Pyropissite* may be a variety.

HATCHETTINE (*Mineral Tallow*).

y, like spermaceti; or subgranular like bee's wax, soft and . G. = 0·6. Translucent; weak pearly. Yellowish white, llow, or greenish yellow. Greasy motionless, readily soluble r. C.c.: 85·91 carbon, 14·62 hydrogen, or similar to ozocerite yne (fusible at 115°), Merthyr Tydvil; Schaumburg.

FICHTELITE, C_4H_8.

talline (oblique prismatic) lamellæ, which swim in water, k in alcohol. White and pearly. Fuses at 111°, but forms crystalline on cooling. Very easily soluble in ether and peal by alcohol. C.c.: 88·9 carbon and 11·1 hydrogen. In pine a peat-moss near Redwitz in Bavaria.

HARTITE, C_6H_6.

thic; but mostly like spermaceti or white wax, and lamellar but not flexible. H. = 1; G. = 1·016. Translucent, dull s. White. Melts at 165°, and burns with much smoke. oluble in ether, much less so in alcohol. C.c.: 87·8 carbon 2 hydrogen. Oberhart in Austria.

KÖNLITE, C_9H.

talline folia and grains. Soft. G. = 0·88. Translucent, s. White, without smell. Fuses at 120° to 137°. Sol. in ; precipitated by water in a white crystalline mass. C.c.: rbon, 7·7 hydrogen. Uznach near St Gall; Redwitz.

SCHEERERITE, CH_2.

que prismatic; tabular or acicular. Soft and rather brittle. to 1·2. Translucent; resinous or adamantine. White, to to yellow or green. Feels greasy, has no taste, and when smell, but when heated a weak aromatic odour. Insoluble r; readily sol. in alcohol, ether, and nitric acid. C.c.: on, 25 hydrogen. Uznach. *Branchite*, white, translucent, at 167°, is similar; Montevaso in Tuscany.

IDRIALITE, C_8H_8.

ive; fracture uneven or slaty; scratched by 1·5, d 1 to 1·6 (1·7 to 3·2). Opaque; resinous. Greyish or sh black; streak blackish brown, inclining to red. Feels . Burns with a thick smoky flame, giving out sulphurous nd leaving some reddish brown ashes. C.c.: 77 idrialine carbon and 5·3 hydrogen) and 18 cinnabar, with a little luminia, pyrite, and lime. The idrialine may be extracted n olive oil or oil of turpentine as a pearly shining mass. tly fusible. Idria.

727. TORBANITE.

Massive; fracture subconchoidal. Yellow, brown-grey, brown. H. = 1·5 to 2; G. = 1·28. C.c.: 60 to 65 carbon, 9 h 4 to 5 oxygen, 10 to 20 silicate of alumina. When distille redness yields a burning fluid holding paraffin in solution redness a large quantity of highly illuminating gas. S the microscope to consist of granules of a yellow bituminou with interstitial shaly matter. Torbanehill in Scotland in Bohemia, Kuralena and Murayevna in Russia.

728. DOPPLERITE.

Jelly, like elastic masses. Brownish black, streak brown lustre H. = 0·5, G. = 1·1. After drying H. = 2·5; G. = 1·2 ubble in alcohol and ether. An acid substance related t acid. From peat beds, Aussee (Styria) and Switzerland.

THE COALS.

729. ANTHRACITE (*Glance Coal*).

Massive and disseminated, rarely columnar. Fracture con brittle. H. = 2 to 2·5, G. = 1·4 to 1·7. Opaque, brilliant iron-black, streak unaltered. Perfect conductor of el Burns difficultly with a very weak or no flame, and does n in the closed tube yields a little moisture, but no empyr oil, deto[illegible] with nitre. C.c.: carbon above 90 per ce 1 to 3 oxygen, 1 to 4 hydrogen, and 0 to 3 nitrogen, a chiefly of silica, alumina, lime, and peroxide of iron. Co some part of all coal-field, and especially in the United S in Rhode Island, Massachusetts, and above all in Penn Used chiefly for manufacturing metals.

730. COMMON COAL (*Black Coal, Steam or Manufacturing Coal*).

Compact, slaty, or coarsely fibrous, often dividing int bedded, columnar, or cubical fragments. Fracture conchoi even, or fibrous, rather brittle or scaly. H. = 2 to 2·5, G 1·2. Vitreous, resinous, or silky in the fibrous variety brown, pitch-black, or velvet black. Burns easily, emitti and smoke with a bituminous odour, heated in the clo yields much oil. C.c.: 74 to 90 carbon with 6·0 to 8 or 1 3 to 6 hydrogen, 0 to 1 to 2 nitrogen, 0·1 to 3 sulphur, a earthy matter or ash, in 100 parts.

Slate Coal or *Splint* has a thick slaty structure, and r fracture. *Cherry Coal* is the name applied to the brittle la trous variety common in the Lancashire coal-fields. *Caking* more bituminous variety which undergoes combustion when caking or agglutinating during combustion. *Cannel Coal* ha ous, glimmering lustre, and a flat conchoidal fracture, bu irregular cubical fragments, but is more solid and takes polish than other varieties. The bars with a bright fl yields much gas. Abundant in many fields, as in Englan land, and Ireland, in Bohemia and France, in Germa southern Russia, British America, and the United State numerous fields, especially in the valley of the Missi spe found in China, Japan, Hindostan, Australia, Borneo, and the Indian islands.

731. LIGNITE (*Jet, Brown Coal*).

Distinctly vegetable in organization, the external form, and v the internal woody structure, being preserved. The te pact woody, or earthy. Fracture conchoidal, woody, or soft and often friable. C.c.: 50 to 75 carbon. Lignite sometim ous, mostly glimmering or dull. Brown, black, or bl Burns easily with an empyreumatic odour, and a solution o deep brown. C.c.: 47 to 75 carbon, 5·5 to 7·5 hydrogen, oxygen (with nitrogen, and [illegible]). Very pitchy conchoidal fracture, and is [illegible]. Brown coal o Bovey-Tracy in Devonshire, also in Germany, Hungary, Italy, and Greece. [illegible] or Ireland seem a Coal as fuel, but much inferior to common coal. The coals of Yorkshire, Antrim, Brora, Mull, and Skye are in ate variety.

ERAL WATERS. No absolute line of demarcation can be drawn between ordinary and mineral waters. There is usually in the latter an excess of mineral constituents or of temperature, but some drinking waters contain more mineral constituents than other- that are called mineral waters, and many very pure waters, both cold and warm, have been regarded for ages as sacred springs.

As to the origin of mineral waters, there is much in accordance with the elder Pliny said, that waters are such as the soil through which they flow. Thus in limestone and chalk districts there is an excess of lime is usually present; and the waters of a particular district have much resemblance to each other—as in the Eifel, in Auvergne, and in the Pyrenees. But this is only a partial explanation, for waters are by no means necessarily uniform throughout a particular geological formation. We do not know with certainty the depth from which various mineral waters proceed, nor the various distances from the surface at which they take up their different mineral constituents.

The source of the temperature of thermal waters remains a point of much uncertainty. Among the assigned causes are the internal heat of the globe, or the development of heat by chemical or electrical agencies in the strata through which they arise.

The occasional intermittence is doubtless often dependent on the periodical generation of steam, as in the case of the Geysers. A few geological facts are certain, which throw light on the origin of mineral waters. Such springs are most abundant in volcanic districts, where many salts of iron and much carbonic acid are present. They occur most frequently at meetings of stratified with unstratified rocks, in valleys, and at points where there has been dislocation of strata.

The diffusion of mineral waters is very extended. Pliny was quite correct in observing that they are to be found on the line heights and arising from the bottom of the sea. They are found at the snow in the Himalayas and close to the sea at Baiæ and Ischia. They are to be found in all quarters of the globe, but more particularly in volcanic regions, as in the Eifel and Auvergne, in the south of Naples, and parts of Greece, in Iceland, New Zealand, and Japan. But there are few countries in which they are not to be found, except in very flat ones, such as the deltas of rivers, for instance, in the north of France, where they are very few, and in Holland, from which they are absent. France, Germany, Italy, and Spain, as well as Asia Minor, and the Caucasus, are all rich in mineral waters. The British Isles have a fair though not very large portion of them. There are a few in Sweden and Norway. They are abundant in the United States, less so in Canada. They are found in the Azores and in the West India Islands. Of their occurrence in the interior of Africa or of Australia we know little, and the same is true of South America. But they are met with in Algiers, in Egypt, and in the Holy Land. The vast Indian peninsula has, for its size a comparatively small supply.

As the effects of mineral waters on the bodily health have been found to be different from those of common waters, an explanation of this has been naturally looked for. It has been imagined that there is something in the nature of mineral waters, that their heat is not ordinary heat, that their condition is a peculiar one. Some French modern writers even say that there is a certain life in them, that their constitution is analogous to that of the serum of the blood. But we must put these speculations, and be guided as far as possible by ascertained facts, respecting the action on the system of waters of heat and cold, and of the mineral constituents present.

Mineral waters, when analysed, are found to contain a great many substances, although some of them occur only in very minute quantities: soda, magnesia, lime, potash, alumina, iron, boron, iodine, bromine, silica, lithium, caesium, rubidium, fluorine, barium, copper, manganese, strontium, silica, phosphorus, besides organic matters, and various organic deposits known under the name of glairin or baregin. Of gases, there have been found carbonic acid, hydrosulphuric acid, nitrogen, carburetted hydrogen, oxygen, and ammonia. Of all these by far the most important in a therapeutic point of view are soda, magnesia, and iron, carbonic acid, sulphur and its hydrosulphuric acid. These substances, detected separately by chemists, are in their analyses combined by them in various salts, if not with absolute certainty, under

close approximation to it. Those combinations are
merous, and some waters contain ten to twenty of
but there are always some predominating ones,
mark their character, while many of them, such as
, rubidium, or fluorine, occur in mere traces, and
be assumed to be of any real importance. Mineral
therefore to dive themselves into weaker or stronger
of salt and gases in water of higher or lower
ature. For medical purposes they are used either
ly or internally, for bathing or for drinking. As
antity of salt present commonly bears but a very
proportion to that of the fluid containing them,
becomes a very influential agent in mineral water
nt, about which it is therefore necessary to say
ing.

he action of hot and cold baths the reader is referred
ticle Baths. But it may be observed here that,
ng to the most generally received opinion, the cuta
rface does not absorb any portion of the salts in a
water bath, although it may absorb a little gas
aline water, for instance, at most acting as a slight
nt on the skin), and that neither salts nor gases
y action on the system, except as stimulants of the
th partial action on the respiratory organs.

ems to be ascertained that drinking considerable
of cold water reduces the temperature of the body,
hes the frequency of the pulse, and increases the
pressure temporarily. Water when introduced
e stomach, especially if it be empty, is quickly
d; but, although much of the water passes into the
here is no proof that it ever produces in them, as is
es supposed, a state of fluidity or wateriness.
ntically, the imbibition of large quantities of water
a sort of general washing out of the organs. This
s a temporary increase of certain excretions,
ted diuresis, and a quantitative increase of urea,
ride of sodium, and of phosphoric and sulphuric
the urine. Both the sensible and the insensible
tions are augmented. A draught of cold water
tedly stimulates the peristaltic action of the
es. On the whole water slightly warmer than best
by the stomach, and is more easily absorbed by it
ld water, and warm waters are more useful than
s when there is much gastric irritability.

addition to the therapeutic action of mineral waters,
re certain very important subsidiary considerations
must not be overlooked. An individual who goes
ome to drink them finds himself in a different
, with possibly a considerable change in altitude,
s necessarily altered, and his usual home drinks are
p. There is change in the hours of going to bed and
. He is relieved from the routine of usual duties,
rown into new and probably cheerful society. He
more exercise than when at home, and is more in the
ir, and this probably at the best season of the year.
portant for the matter of season and climate been
that it is an established axiom that waters can be
the greatest advantage during the summer months
fine weather and during the periods most convenient
xation from business. Summer is therefore the bath
but of late years provision has been made in many
with the aid of specially constructed rooms and
s, for carrying on cures satisfactorily during the
season, e.g., at Aix-la-Chapelle, Wiesbaden, Baden
Baden in Switzerland, Bex, Vichy, and Bath. The
y bath season extends from the 15th of May to the
30th September. The season for baths situated
siderable elevations commences a month later and
ates some ten days earlier. Mineral waters may be
ed at home, but patients seldom so use them; and
this necessarily limits the time of their use. It is co
to declare that the treatment should last for such or
a period. But the length of time for which any rem
to be used must depend on its effect, and on the nat
the particular case. It is found, however, that the
tinued use of mineral waters leads to certain disturb
of the system, which have been called crises, such as
lessness, colics, and diarrhœa, and to skin eruptions k
as *la poussée*. This cause, and also certain peculiarit
the female constitution, have led to the period of
weeks to a month being considered the usual perio
treatment. A certain after treatment is often prese
—such as persistence in a particular diet, visiting sp
or climates of a different and usually of a tonic cha
or continuing for a certain time to drink the wat
home. It may be added that the advantage of h
recourse to mineral waters is often felt more after
during treatment.

Since improved methods of bottling have been disco
and the advantage of an additional supply of carboni
has been appreciated, the export of waters from their s
has increased enormously, and most of the principal
can now be advantageously used at home. It m
added that many of the artificial imitations of the
excellent.

The history of the use of mineral waters can onl
be alluded to. They have been employed from the e
periods, and traces of Roman work have been fou
most of the European baths which are now in favou
almost all the thermal ones. Occasionally new s
are discovered in old countries, but the great majo
them have been long known. They have vari
popularity, and the modes of applying them hav
varied, but less so than has been the case with most
ordinary medicines. Warm waters, and those cont
small quantities of mineral constituents, appear to
remained more steadily in favour than any other
within the appropriate sphere of mineral waters, wh
limited to the treatment of chronic disease.

The attempt has been made to range mineral
according to their therapeutic action, according to
internal or external use, but most generally accord
their chemical constituents so far as they have bee
time to time understood, and a judicious classif
undoubtedly is a help towards their rational employ
But their constituents are so varied, and the grad
between different waters are so finely shaded off,
has been found impossible to propose any one c
scientific classification that is not open to num
objections. Thus a great many of the sulphur wat
practically earthy or saline ones. Yet because the
contain very minute amounts of such a gas as hydrosul
acid, an ingredient so palpable as always to
attention, it is considered necessary to class them
the head of sulphur. The general rule is to atte
class a water under the head of its predominant ele
but if the amount of that be extremely small, this le
such waters as those of Mont Dore being classif
alkaline or aerated, because they contain a very
soda and arsenic. The classification in the following
which is that usually adopted in Germany, has the
of comparative simplicity, and of freedom from theo
considerations which in this matter influence the
much more than the German writers. The more imp
constituents only are given. The amount of solid co
ents is the number of parts to one thousand parts
water, the temperature of thermal springs is added
waters are classified as indifferent, earthy, salt, sulphu
iron, alkaline, alkaline saline—with subvarieties o
waters and purging waters.

addition to their solid constituents, gases are present in waters in considerable quantity. There is a little n and a good deal of nitrogen in some of them; the ity of hydrosulphuric acid, even in strong sulphuric s, is wonderfully small: but the volume of carbonic present is often very large,—for instance, in the case of geu, Schwalbach, and Selters. Carbonic acid is so ally diffused that it is practically a very important in the therapeutics of mineral waters. Springs that in it are far the most agreeable to the taste, and quently most popular with patients. The immediate of the carbonic acid which they contain is that of ant stimulation to the stomach and system, although scarcely be said to approach, as some have thought, lighter forms of stimulation from alcoholic drinks. emely little appears to be known of its actual operation e system: a part of what is swallowed is returned by ation, and a part passes on t whether appreciable quantity reache e blood is doubtful. e is no question that carbonic acid increases diuresis. ically it is found to aid digestion, helping the functions e stomach, and in a slight degree the peristaltic action e intestines. The increased flow of urine may be d by its favouring the absorption of water by the ach. In some baths carbonic acid i bundant that utions have to be taken to prevent its tendency to mulate on account of its heavy specific gravity. Car acid gas, used as a bath, prove stimulating to the and to the general system: but its employment has nswered the expectations formed of it.

ifferent Waters scarcely vary in chemical qualities from ordi drinking water; but they are usually of high temperature therapeutic action, which is mainly exercised through baths, en explained on the theory of peculiarities of their electric or al condition, about which we know nothing definite, and on résence in some of them of a large quantity of nitrogen. It so been ascribed to the various organic substances in some of such as glairin, which when collected is sometimes useful as plasm. These waters are not often much drunk, but any ncy they may have in dyspepsia and perhaps in neuralgic oeas must be attributed to the favourable action of hot water digestion. The waters of this class, especially the hotter in the form of baths, are extremely useful in resolving the of inflammation, in thickenings of the joints, and in chronic matism and gout. They also are often effective, especially the ones, in neuralgia and in some hysterical affections. They metimes prescribed in urinary affections, in which case they bly assist by dilution. The effects of many of these waters are by the baths often being situated at considerable elevations n out-of-the-way spots, when the Germans called them *bader*. They are very widely diffused, being found in all rs of the globe, especially in volcanic districts. There are in New Zealand; in America the hottest are in the West and lifornia.

MINERAL WATERS

Waters are so called from containing a predominant amount
de of sodium They also generally contain chlorides of
and of lime and occasionally small amounts of lithium,
and iodine They further often contain a little iron, which
portant a bitter on the great majority of the drinking wells
ge supply of carbonic acid. There are cold and hot salt
Sometimes they are used for drinking, sometimes for
and in the case of them is often resorted to.
great quantity of *common* salt contained daily by many is
about 300 grains The maximum quantity
to be present in any well may be 525 grains but commonly not
that amount is taken. The increase to the usual
therefore probably not much more than one third.
be presumed that the action of a solution of salt on an
different from that of the same amount of salt
food Salt introduced into the stomach excites the
gastric juice, and favours the peristaltic action and
in considerable quantity is distinctly aperient We
how it is useful in dyspepsia in atony of the stomach and
, and sometimes in chronic intestinal catarrh Salt when
by the stomach appears again in the urine, of which in
amount both of fluid and of solid constituents, especially
It seems therefore to be pretty certain that considerable
of salt taken into the circulation increases the excretion
ous products through the urine, and on the whole
the transformation of tissue Salt is thus useful in
stimulating the system, and also in anæmia, especially
is also present In some German stations, at Soden
salt waters are considered to be useful in chronic
or granular pharyngitis

salt waters, as nearly even 1 cent, contain more than 3
of chloride of sodium, some of the strongest perhaps from
per cent Their primary action is as a stimulant to the
which action it is probable that the other chlorides,
that of calcium, and still more the carbonic acid often
to operate In this way, and when aided by various pro-
what may be termed water poultice and packing, they
useful in removing exudation in chronic metritis and
mours of the uterus, and generally in scrofula and rachitis,
nally in some chronic skin affections

such accord high praise to some of their thermal salt
paralysis, and some German ones are used in a similar

rake, perhaps varying from 0·5 to 1·0

there are salt bearing strata, as in Germany, Galicia, Italy, Switzerland, France, and England. Very powerful waters of this class are those of St Catherines in Canada

The presence of minute portions of *iodine* or *bromine* in salt waters is by no means infrequent, and they appear in considerable quantity in some few It is, however, extremely doubtful whether any known spring contains a sufficient quantity of iodine, still more of bromine, to act specially on the system, even if that action were not necessarily superseded by the presence of the large quantity of other salts with which they are associated Some of the best known springs of the kind are Challes, Wildegg, Castrocaro, Hall, Adelheid's Quelle, Kreuzbrunnen, Kreuznach, Woodhall Spa.

Iron or Chalybeate Waters - Iron usually exists in waters in the state of protoxide or bi-carbonate, less frequently as sulphate or crenate, and very rarely at all as chloride. The quantity present is usually extremely small It may be said to vary from ·12 to ·03 in the 1000 part of water Some wells considered distinct chalybeates contain less than ·03. Many wells, especially in Germany, have a rich supply of carbonic acid, which is unfortunately wanting in French and English stations

It has long been the prevalent idea that want of iron in the blood is the main cause of chlorosis and of other anæmic conditions, and that these conditions are best relieved by a supply of that metal. Since the detection of it in hæmoglobuline this view has been still more popular. It is pretty certain that the blood contains 37 to 42 grains and the whole system 70 to 74 grains of iron; and it has been calculated that in normal conditions of the system somewhat more than one grain of iron is taken daily in articles of food, and that the same amount is passed in the fæces; for although the stomach take the iron up it is excreted by the alimentary canal mainly it being doubtful whether any is excreted in the urine. It is possible by drinking several glasses to take in more than a gram of carbonate of iron in the day, equivalent to half that amount of metallic iron It has further been enormously reckoned from practice that 10 to 15 grains of metallic iron suffice to supply the deficiency in the system in a case of chlorosis It is thought probable that a portion of the iron taken up in water is in certain pathological state not excreted, but returned in the system, and goes towards making up the want of that metal But, whether this or any other explanation be satisfactory, there is no question as to the excellent effects often produced by drinking chalybeate waters (especially when they are carbonated), and by bathing in those which are rich in carbonic acid after they have been artificially heated. As regards the drinking cure we must not, however, forget that carbonate and chloride of sodium, and also the sulphate, are often present and must be credited a share in the cure Thus chloride of sodium is a power

juvant in the strong Stahl Quelle of Homburg and in the
n Well at Saratoga. A whole category of female complaints is
l successfully with these waters. Indeed anæmia from any
, as after fever or through loss of blood, and enlargements of
leen, are benefited by them. The stimulating action of the
s supply of carbonic acid in steel baths is a very important
nt; no one now believes in direct absorption of iron from the
. Iron waters are scarcely ever thermal. They are extremely
ou in all countries, frequently along with sulphuretted
gen in bogs, and near coal measures. But such springs and
rbonated wells generally are weak, and not now held in much
.

ay be added that some of the strongest known iron wells are
ted or *aluminated*. They are styptic and astringent, and can
e used diluted. They are sometimes useful as an application
rs and sores. Such springs have often been brought into notice,
ver retain their popularity. They are known in the Lake of
, in Wales, in Scotland, as well as in Elba, Aetna, and of late
he Bedford Alum and Oak Orchard Springs, U.S., have been
t into notice, the latter containing 19 grains of free sulphuric
the pint. All such springs have been considered useful in
a, anæmia, and chronic diarrhœa.

hur Springs.—Waters having the odour of hydrosulphuric
owever slightly, are usually called sulphur ones. The
mell sometimes to the presence of the free acid, sometimes
phides of sodium, calcium, or magnesium, and sometimes
Hydrosulphuric acid is absorbed more freely by cold
ter, and is therefore most abundant in cold springs. The
les decompose and give off the gas. Most of these
ear coal or shale measures, or in rocks containing lignite, or in
and in places generally where organic matter is present in
or strata. Many of them contain so little mineral impreg
that they might as well be classed among indifferent
hy waters. One group contains a considerable amount of
e of sodium, another of sulphate of lime, while a third has
ineral impregnation but contains sulphides.
osulphuric acid is a strong poison, and its action on the
has been pretty well ascertained. It has been assumed that
in mineral waters acts similarly, though in a modified
but there is next to nothing absolutely known of the
of the small quantities of the gas that are present in mineral
and which certainly have no toxic effect. It has been
d that this gas has some special action on the portal system
on the liver. On the connexion of metallic poisoning
e liver has been founded the idea that sulphur waters are
n metallic intoxication. Drinking large quantities of these
especially of such as contain sulphate or chloride of
or magnesia, combined with hot baths and exercise, may
break up albuminates, but there is no proof of the action
sulphur.

imilar reasons, and primarily to counteract mercurial poison
waters have been considered useful in syphilis. But it
well to remember that at most baths mercury is used along
em. No doubt they are frequently, like other warm waters,
n bringing out old eruptions, acting in this way as a test
ilitic poison, and in indicating the treatment that may be
required. Sulphur waters, both hot and cold, are used in g
rheumatism, in dyspepsia, in hepatic and cutaneous affection
of late years inhalation of them has been popular in phth
in laryngeal affections. They have long been popular rem
cutaneous affections. While so much doubt has been cast
action of the sulphur of these waters, it may be admitted t
sulphides are probably decomposed in the stomach and hy
phuric acid generated. That gas is probably a slight str
to the intestine. What hydrosulphuric acid reaches the l
eliminated by the lungs. There seems to be no doubt that
absorbed in small quantities by the skin.

It is in sulphur waters chiefly that glairin and baregin
This peculiar organic substance has been found both in Americ
in European springs. Cold sulphur springs are very widely d
throughout the world. Thermal ones are not so common
haps the largest though not the strongest group of the latte
be found in the Pyrenees. We may remark again how ver
hydrosulphuric acid there is in many of the most favourite s
-springs, including the very popular White Sulphur ones of V
There seems to be something peculiarly unsatisfactory
analyses of sulphur waters, and there has been difficulty in com
ing the following imperfect tables.

Some of the most powerful cold wells are those of Challes (
very peculiar water), Enk, and Harrogate. Enghien has a ver
amount of chloride of sodium in its springs. Cold sulphur
are on the whole more used in liver and indigestion than
ones. The general effects of warm sulphur waters differ so
at the various baths as to make it difficult to mention an
special to particular localities. Schinznach has a reputat
skin complaints, Cauterets, Eaux Bonnes, and Challes in lar
affections, the two Vixes, Luchon, and Archena in syphilis.

Alkaline Waters are such as contain carbonate (chiefly bic
ate) of soda along with an excess of carbonic acid. Of the ac
those carbonates it is known that when taken into the s
they are neutralized by the gastric juice, and converted into c
of sodium. On their introduction into the stomach they p
an increased flow of gastric juice. If given during or imme
after meals in any quantity they impede digestion. They s
increase peristaltic action, but only feebly unless as a cold b
salts. They act slightly as diuretics. Of the connexion b
the biliary system and alkalies, which undoubtedly exists, no
is known with certainty. The alkalization of the blood by t
assumed by many but not proved. It is very doubtful w
they reduce the quantity of fibrine in the blood, and thus r

MINERVA (*i.e.*, *menes vi*, endowed with mind) was the Roman goddess who presided over all handicrafts, inventions, arts, and sciences. She was probably an Etruscan deity, but her character was modified on Roman soil through her identification with the Greek Pallas Athena (see ATHENA). No legend of her birth is recorded; the Roman deities were abstractions, not distinct persons with an individual history. Her chief worship in Rome was in the temple built by Tarquin on the Capitol, where she was worshipped side by side with Jupiter and Juno. This foundation may be assigned to Etruscan influence. She had also an old temple on the Aventine, which was a regular meeting-place for dramatic poets and actors. The dedication day of the temple and birthday of the goddess was March 19, and this day was the great festival of Minerva, called *quinquatrus* because it fell on the fifth day after the Ides. The number five was sacred to the goddess. All the schools had holidays at this time, and the pupils on reassembling brought a fee (*minerval*) to the teachers. In every house also the *quinquatrus* was a holiday, for Minerva was patron of the women's weaving and spinning and the workmen's craft. At a later time the festival was extended over five days, and games were celebrated. This feature is evidently due to the Graecizing conception of Minerva as the goddess of war. To this same Graecizing tendency we must attribute the *lectisternium* to Minerva and Neptune conjointly after the battle of the Trasimene Lake. The 23d had always been the day of the *tubilustrium*, or purification of the trumpets, so that the ceremony came to be on the last day of Minerva's festival. Trumpets were used in many religious ceremonies; and it is very doubtful whether the *tubilustrium* was really connected with Minerva. There was another temple of Minerva on the Cælian Hill, and a festival called the Lesser *quinquatrus* was celebrated there on June 13–15, chiefly by the flute-players.

Minerva of the Cælian temple was called Capta, June 19 was the foundation day of this temple and the birthday of the goddess. The *palladium*, an archaic image of Pallas brought from Troy to Lavinium, and thence to Rome by the [illegible] of the Nautii, it was preserved in the temple of Vesta as a pledge of the safety of the city. There are some traces of an identification of Minerva with the Italian goddess Nerio, wife of Mars; it is probable that March 19 was originally a feast of Mars.

MINGRELIA, a former principality of Transcaucasia, which became subject to Russia in 1804, and since 1867 has constituted three circles of the government of Kutais—Letchgum, Senakh, and Zugdidi. The country corresponds to the ancient Colchis; and Izgaur or Iskuriah on the Black Sea coast, which was the capital during the period of Mingrelian independence under the Dadian dynasty, is to be identified with the ancient Dioscurias, a colony of Miletus. The Mingrelians (still almost exclusively confined to the Mingrelian territory, and numbering 197,000) are closely akin to the Georgians. See CAUCASUS, vol. v. p. 257, and GEORGIA.

MINIATURE is a term which by common usage has come to be applied to two different branches of painting. Derived from the Latin word *minium*, the red pi used in the primitive decoration of MSS., in the first it is the technical word employed to describe a paint a MS.; and, from the fact of such pictures being ex on a reduced scale, it has its secondary and modern cation of a small, or miniature, portrait. In the latte it belongs to the general subject of painting. Here proposed to trace the development of the miniature in of the different schools of Europe.

The rise of the art of ILLUMINATION, in whic miniature plays so important a part, has been des under that heading, and something has been said i place about the earliest extant specimens of min painting. Unfortunately we cannot with any cer reach farther back than the 4th century for the ancient of them; and all remaining examples betwee period and the 7th century in Greek and Latin can be counted on the fingers. The two famous cod Virgil in the Vatican Library stand pre-eminent most ancient Latin MSS. decorated with paintings. miniatures in the first of them, the *Codex Ro* are large and roughly yet boldly executed paintings, have no pretension to beauty, and are simply il tions; but they are as old as the 4th century, a of the highest value in enabling us to appreciat debased style to which classical art had descende which no doubt was more largely employed than we think. The second MS., the *Schedæ Vaticanæ*, whic also be assigned to the 4th century, is far more and retains a good deal of the grace of classic ar the same kind, but of rather later date, are the frag of the *Iliad* in the Ambrosian Library at Mila miniatures of which are generally of excellent Next comes the Dioscorides of the Imperial Libr Vienna, with its semiclassical portrait miniatures ex at the beginning of the 6th century. Of a rathe period are the paintings which illustrate the Gree of Genesis in the same library. A far finer and olde of the same book of the Pentateuch once existed Cottonian Library, but was almost totally destroy fire. The few fragments of the miniatures whic filled this volume, and which were of the 5th centu sufficient to show what excellent work could be done capital of the eastern empire, from whence the MSS probably came. The late interesting discovery of a trated MS. of the Gospels in Greek, of the latter the 6th century, at Rossano in southern Italy, adds a number to our scanty list of early volumes of this which is closed by the Latin Pentateuch in the libr the earl of Ashburnham. This last MS., however, older than the 7th century. It was executed in and is adorned with many large miniatures, not artistic merit, but of great interest for the hist painting and of costume.

Coeval with the MSS. which have just been enum are the beautiful mosaics and wall paintings whi seen at Rome, Ravenna, and in other parts of Italy, as standards of comparison and carrying on the his art where MSS. fail us. The strong and ever inc Byzantine element which appears in these works p us to find the predominance of the same influence w again pick up the broken thread of the history of mi painting. We may then, at this point, turn for a m to the east of Europe and state briefly what rem Greek art in MSS. Of Greek miniatures there a many fine examples extant, but, excepting those have been noticed above, there are few which are than the 11th century. At this period the mi appears in the set form which it retained for the ne or three hundred years; and the connexion betw

and that of the mosaics is too evident for us to be at to explain the course of development. The figure ing is delicate, but rather exaggerated in length, the s are brilliant and the whole effect is heightened by ine background of gold. In some few instances, er, the Greek artist breaks away from conventionalism, perfectly when portraying the divine features of the n or the rapt aspect which deeply stirs his feelings, he with the noble dignity with which he invests Miniatures also caught the fancy of these ; and there still remain MSS., such ilter and saints' lives adorned throughout with le little drawings of great symmetry and beauty ornamentation which was employed in Greek MSS. period of which we are speaking, either as frames natures or as borders or head pieces, is designed tly after Eastern types, and has more than an ntal likeness to the patterns which are seen in the and prayer carpets of Persia. After the 13th y decadence sets in, and we need not follow the of Byzantine art in MSS. further than to notice that diately from it sprang such national styles as those , Bulgaria, and modern Greece.

nwhile, in the West, under the fostering care of magne, arose a great school of decoration in MSS., at the close of the 8th and beginning of the 9th y were multiplied and enriched with all the splendour colours and gilding could give to them. But the thus ornamented were almost always copies of the l, or Bibles, or church service books, which afforded scope for invention. Hence among the miniatures of eriod we have an endless repetition of portraits of angelists, drawn, for the most part, in a lifeless way Byzantine traditions, and degenerating, as time passes, sitive ugliness. The few miniatures of other descrip such as Biblical illustrations, show no great merit, bald barbaric splendour was generally preferred to effect. But an exception must be made in regard style of drawing found in the MS. known, on t of its present resting place, as the Utrecht Psalter. olume is filled from beginning to end with delicately pen illustrations, designed and executed with a which, compared with the mechanical and clumsy g of other Continental MSS. of the period, is astonish- And these drawings are of particular interest for us, y are of the style which was adopted in England and gives to Anglo-Saxon art its distinctive aspect ted about the year 800 or early in the 9th century, robably in the north of France, the volume was soon ht to England, where, however, MSS. of the same it may be assumed, had long before been intro- The light "fluttering" outlines of the drapery and detail of the drawings seem to suggest that the ginal were derived directly from Roman life, and partly copied from sculpture, but those models have undergone many modifications before passing he type of the drawings of the Psalter. That the was copied from an older one there can be scarcely a ; and it is not impossible that the original archetype date back two centuries earlier. May not MSS. St Augustine and his companions brought from Rome contained drawings of the same kind? The style of ng was, at all events, adopted and became nationalized gland; but it had there a rival in the Irish school of entation, introduced from the north of the island. arly civilization of Ireland placed her in the van of art opment in these islands. The wonderfully intricate eed designs which render Irish MSS. of the 7th 8th centuries such marvels of exact workmanship their origin, in all probability, from the metal work of earlier ages. But, apart from ornamentation, th miniatures of saints and evangelists are extraordina grotesque instances of purely mechanical drawing, cause us to wonder how the same eyes and hands assisted in the creation of such beautiful specimens ornament could tolerate such caricatures of the shape. The explanation is perhaps to be found in stitious regard for tradition. This style of art was by the monks to Iona and thence to Lindisfarne, wh founded the school which produced, in the 8th a centuries, the richly ornamented codices of Durham. then, Byzantine models were copied on the Contine tree drawing introduced from the south and the i ornamentation brought in from the north were pract England, but the tree drawing, with its accomp decoration copied from foliage, and gradually dev into beautiful borders harmoniously coloured, gain day, and lasted down to the time of the Norman Co The one great fault of this latter style of drawing the eye at the first glance. This is the inordinate of limb with which the human figures are endowed this blemish is forgotten when one comes to appreci many points of merit in the designs.

In Italy, after a long period of inactivity, tw different styles of decoration of MSS. sprang into ex The first of these was that of the Lombardic school, is distinguished by intricate patterns and bright col The large initial letters which are found in the M the 11th and 12th centuries, the best period style, are often a perfect maze of interlaced bands and forms, and are extremely handsome and effective. drawing however, seems to have been but little pr by the Lombardic artists, but such as there is app a broad scale and well executed. In the collect Monte Cassino are some of the best examples school. In the second style which developed in It Byzantine influence was at first most marked. among its early specimens of the 13th centu some which might pass for the work of Greek artists the genius of the Italians soon assimilated the element, and produced a national school which throughout the peninsula and afterwards exten influence to southern France and Spain. It is, h remarkable that in a country which produced su pictures and wall paintings at an early date there paratively little miniature painting in contemporar A curious and early instance of this kind of art in a MS. in the British Museum, written and mented with a series of miniatures at Winchester, 12th century, in which are two paintings wh purely Italian and of more than ordinary excellence

In the majority of the extant Italian miniatures 14th century the influence of the great artists Florentine school is manifest. The peculiar treatm flesh tints, painted in body colour over a founda olive green, and the peculiar vermilion and other which need be but once seen to be ever afterwards nized as belonging to this school, are constantly The figures are generally rather shortened and the carried in straight folds, very different characteristi the waving figures and flowing drapery of the Engl French artists of the same period. The ornamen which accompanied this style of miniature ge consists of heavy scrolls and foliated or feat pendants from the initial letters, with spots of g here and there in the border. There are also extan examples of a most beautiful kind of ornamentation appears to have originated in central Italy, and seems to partake of the qualities of both the st Italian art of which we have been speaking, co

awing of the Florentine school with a lighter colour
nich may have been suggested by the Lombardic.
native Spanish miniature art little can be said. In
sigothic MSS. of the early Middle Ages there is no
ent beyond roughly coloured initial letters and some
ic figure drawing. A little later, however, we get
indication of national peculiarities in the MSS. of
0th, 11th, and 12th centuries. Here there appear
ures, stiff and rude in their drawing, but exhibiting
mistakable Spanish predilection for sombre colours,
ky reds and yellows and even black entering largely
e compositions.
materials at our disposal of the 10th, 11th, and
enturies show the gradual development in France
estern Germany of a fine free hand drawing which
encouraged by the proportionately increasing size
oks. Both in outline and colour the fully de
d miniatures of the 12th century are on a grand
and initial letters formed of scrolls and interlacings
the same proportions. The figure drawing of this
s frequently of great excellence, the limbs being well
tioned; care is also bestowed upon the arrangement
drapery, which is made to follow the shape and, as
e, to cling to the body.
the great revulsion from the broad effects and bold
ur of the 12th century to the exact details and careful
of the 13th century is nowhere more striking than
iature painting in MSS. With the opening of the
eriod we enter on a new world of ideas. Large
generally disappear to give place to smaller ones;
e writing supersedes the large hand and miniatures
in circumscribed spaces in the interior of initial
. The combination of the miniature with the initial
it into close connexion with the ornamental border,
develops *pari passu* with the growth of the minia
and by degrees assumes the same national and
tive characteristics. Burnished gold was now also
used, tending to give the miniature a more decorative
ter than formerly. In England, northern France,
he Netherlands the style of miniature painting of
eriod was much the same in character; and it is
difficult to decide from which of these countries a
is derived. English work, however, may be often
guished by its lighter colouring, while deeper and
brilliant hues and a peculiar reddish or copper tinge
e gold marks French origin. The drawing of the
sh artists was scarcely so good, the outlines being
ntly heavy and the colours rather dull. Of the
sh or Cologne school examples are more scarce, but
generally show greater contrasts in the colours,
though brilliant, are not so pleasing. As the
y advanced, and particularly at its close, national
tions became more defined. English artists paid
attention to graceful drawing and depended less
colour. In some of their best productions they are
ed with slightly tinting the figures, finding room in
ckgrounds for display of brilliant colours and gilding.
ance the drawing, though exact, is hardly so graceful,
lour plays a more important part. From the 13th
middle of the 15th century great decorative effect
ained by the introduction of diapered or other highly
ented backgrounds. Of landscape, properly so called,
is but little, a conventional hill or tree being often
as sufficient indication. Borders begin in the 13th
y in the form of simple pendants from the initial
, terminating in simple buds or cusps. But once
d fairly in the 14th century, a rapid development in
rts of the decoration of MSS. takes place. There is
r freedom in the drawing; the borders begin to throw
anches and the bud expands into leaf. This is the best
riod of English miniature painting, many of the fine
of this century which are preserved in the public lib
bearing witness to the skill and delicate touch of
artists. In France the decoration of MSS. received a
impetus from the patronage of King John and Charl
of whose famous libraries many handsome volumes a
to be seen, and later in the century the duke of
carried on the same good work.
With regard to miniature art in Germany there
few examples to guide us that little can be said. M
them are rough in both drawing and colouring; a
the few remaining specimens of really good work f
influence is distinctly seen. In the west the art of
and Flanders, and in the south that of Italy, an
dominant. Perhaps the finest MS. of this southern
to be seen in England is a Psalter belongin
Lord Ashburnham, which was probably executed
14th century at Prague, and is full of miniatures
in drawing and colouring follow the Italian school.
When we enter the 15th century we find great el
in both the great English and French schools
England the graceful drawing of the previous centu
disappeared. At first however, some beautiful exam
purely native work were produced, and still remain to
our admiration. Probably the most perfect of these
are the Sherborne Missal belonging to the duke of
umberland, and a very beautiful volume, a Book of
in the library of Lord Ashburnham. The care be
upon the modelling of the features is particularly not
in English work of this period. In decoration the
of the 14th century had by this time grown to a solid
surrounding the page, but now another form of mos
ive ornament was also used, consisting of twisted t
like scrolls brightly coloured and gilt. As the e
advanced native English work died out, and Frenc
then Flemish influence stepped in.
In France immense activity was shown all throu
15th century in the illumination and illustration of
of all kinds, sacred and profane, and it is in the
of that country, and, a little later, in those of th
Countries, that we can most exactly watch the tra
from mediæval to modern painting. Early in the c
there were executed in France some of the most t
MSS. which have descended to us. In these the col
is most brilliant, the figure drawing fairly exact a
landscape begins to develope. The border has grown
the branching pendant to a framework of golden sp
of conventional and realistic leafage and flowers. T
the middle of the century the diaper disappears for
and the landscape is a recognized part of the mini
but perspective is still at fault, and the mystery
horizon is not solved until the century is well adv
And now Flemish art, which had long lain dormant,
into rivalry with it. French talent, under the stimulus
to it by the Van Eycks, and the struggle was carri
but unequally, through the rest of the century.
art gradually deteriorates, the miniatures become fl
hard; nor are these defects compensated for
mere coarse practice of heightening the colours b
fusely touching them with gold. The Flemish arti
the other hand, went on improving in depth and s
of colouring, and brought miniature painting to its
tion. The borders also which they introduced gave
for the study of natural objects. Flowers, insects,
and jewels were painted in detached groups on a
framework of colour surrounding the page.
But if, at the 15th century drew to its close, the Fl
had outstripped their French rivals they had now
powerful antagonists to contend with. The Italian
been advancing with rapid strides towards the glo

naissance. Early in the century there arose a taste r models. As for their writing and afterwards printing, they went back to the 11th and 12th s for their standards, so they adopted again the ng designs of the Lombardic school for their orna- nd produced beautiful borders of twining patterns by colour, or they took natural objects for their and painted borders of delicate flowers made still il out with clustering stars of gold. Later, they n the ancient classical designs inspiration for the d border of arabesques, medallions, griffins, human ntique objects, &c., which they brought to ach n early in the next century. Their miniatures he rank of exquisitely finished pictures, and were by some of the best artists working under the e of such great houses as those of Sforza and

rther, having advanced to the threshold of the of modern painting, we leave these two great f miniaturists in possession of the west of Europe. ninge had the wider field; they were wanderers from home; and their works are scattered through many lands, from England in the north to Spain in the south. But Italian art had greater inherent strength, and will always hold the first rank. To instance a few of the more famous MSS. of this closing period of miniature painting: the Breviary of Isabella the Catholic, in the British Museum, is a masterpiece of Flemish art produced in Spain; the Grimani Breviary at Venice is another fine example of the same school. Some beautiful Italian miniatures (executed for Leo X. and others) were in the collection lately sold by the duke of Hamilton. The earl of Ashburnham possesses a most delicately illuminated Book of Hours written for Lorenzo dei Medici by the famous scribe Sinibaldo in 1485, as well as a MS. to which Perugino and his contemporaries contributed paintings. And in one MS., a Book of Hours belonging to Mr Malcolm of Poltalloch, are gathered some of the best miniatures of both schools, viz., a series of exquisite paintings by Milanese artists supplemented by later ones of the finest Flemish type. (E. M. T.)

MINIMS. See FRANCIS (ST) OF PAOLA, vol. ix. p. 695.

MINING

nt of mining consists of those processes by which eful minerals are obtained from the earth's crust. inition is wider than what is popularly known as for it includes not only underground excavations open workings, at the same time it excludes under workings which are simply used for passages, such y tunnels and sewers, and galleries for military . We must remark also that the word "mine," or alent in other languages, varies in signification in countries on account of legal enactments or which define it. Thus, in France and Belgium, ngs for mineral are classified by the law of 1810, g to the nature of the substance wrought, into *minières*, *et carrières*. In the United Kingdom, on rary, it is the nature of the excavation which he question for certain legislative purposes, and mines is restricted to workings which are carried nground by artificial light. The consequence i at is merely an underground stone quarry in become a true mine in England, whilst the open for iron ore, such as exist in Northampton ould be true mines under the French law. It is , therefore, in an article on mining, to go beyond ch legal definition of a mine and include the of working minerals in excavations open to day- well as in those which are purely subterranean. ore as it is customary for the miner to cleanse a greater or less extent before selling it to the will treat under the head of mining, those which are commonly known as the dressing or preparation of ores; and, finally, a few remarks recent important legislation affecting mines in the Kingdom, accidents in mines, and the production useful minerals in various parts of the globe.

ubject therefore will be dealt with as follows:

manner in which the useful minerals occur in the rust, viz., tabular deposits and masses; faults or ons.

ospecting, or search for mineral.

oring with rod and core, or diamond drill.

eaking ground; tools employed. Blasting by vari hods: machine drills. Driving levels and sinking

inciples of employment of mining labour.

ans of securing excavations by timber or masonry.

7. Exploitation, or the working away of strata or veins.

8. Carriage or transport of minerals through underground roads.

9. Winding, or raising in the shafts, with the machinery and apparatus required.

10. Drainage of mines, adit levels, pumps, pumping engines.

11. Ventilation and lighting of mines.

12. Means of descending into and ascending from mines.

13. Dressing or mechanical preparation of minerals.

14. Recent legislation affecting mines in the United Kingdom.

15. Accidents in mines.

16. Useful minerals produced in various parts of the globe.

1. *Manner in which the Useful Minerals Occur.*—The repositories of the useful minerals may be classified according to their shape as (A) tabular deposits, and (B) masses.

A. *Tabular Deposits.*—These are deposits which have a more or less flattened or sheet-like form. They may be divided, according to their origin, into (1) beds, or strata, and (2) mineral veins or lodes.

(1) *Beds.* Geology teaches us that a large proportion of the rocks met with at the surface of the earth consist of substances arranged in distinct layers, owing to the fact that these rocks have been formed at the bottom of seas, lakes, or rivers by the gradual deposition of sediment, by precipitation from solutions, and by the growth or accumulation of animal and vegetable organisms. If any one of these layers consists of a useful mineral, or contains enough to make it valuable, we say that we have a deposit in the form of a bed, stratum, or seam. Of course the most important of all bedded or stratified deposits is coal, but, in addition, we have beds of anthracite, lignite, iron ore, especially in the Oolitic rocks, cupriferous shale, lead-bearing sandstone, silver bearing sandstone, diamond-, gold-, and tin bearing gravels, to say nothing of sulphur, rock salt, clays, various kinds of stone, such as limestone and gypsum, oil shale, alum shale, and slate.

The characteristic feature of a bed is that it is a member of a series of stratified rocks; the layer above it is called the *roof* of the deposit, and the one below it is the *floor*. Its *thickness* is the distance from the roof to the floor at right angles to the planes of stratification; its *dip* is the

Strike and dip

tion downwards measured from the horizontal: its
s the direction of a horizontal line drawn in the
plane.

thickness of beds that are worked varies within
ide limits. Whilst the thickness of certain workable
f coal is only 1 foot, and that of the Mansfield
erous shale only 10 to 20 inches, we find on the
hand one of the beds of lead-bearing sandstone at
rnich no less than 85 feet thick, and beds of slate
ceeding that thickness. It must not be supposed,
er, that the thickness of a bed necessarily remains
n. Occasionally this is the case over a very large
but frequently the thickness varies, and the bed may
le away gradually, or in
in size, or become divided
wo owing to the appearance
parting of valueless rock.
shows beds of shale, lime-
iron ore, and sandstone
one of these beds may be
le enough to be worked.

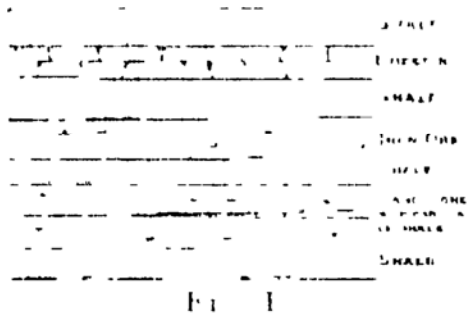

Fig. 1

Mineral Veins or Lodes. - Veins or lodes are tabular
et-like deposits of mineral which have been formed
the rocks by which they are surrounded, they differ,
ore, by their subsequent origin from beds, which, as
ated, are of contemporaneous origin with the enclo-
cks (although of course cases occur in which the
t is lying unconformably upon very much older
or is covered unconformably by very much younger
). It is necessary to explain that the term "vein"
s definition is used in a more restricted sense than is
mes customary among miners, who speak of *veins*
l, clay-ironstone, and slate, which geologically are
eds. They see a band of valuable mineral or rock,
areless of its origin, call it metaphorically a vein or
On the other hand, the definition is broader than
which prevails among some geologists, who would
the term vein to deposits occupying spaces formed
ures.

erm "lode" was defined in 1877 by Mr Justice Field in the
ted Eureka *v.* Richmond case as follows:- "We are of opinion,
re, that the term, as used in the Acts of Congress, is applie
any zone or belt of mineralized rock lying within bound
early separating it from the neighbouring rocks." This
etation seems suitable for the peculiar mining tenure of the
States, where the discoverer of a vein or lode can obtain
g claim of 500 yards in length along the lode. It protects
spector, whose object is to obtain a secure title, the mode of
f the deposit being a matter of small importance to him so long
worth working. In many cases also it would be impossible
le upon the mode of origin until workings had progressed
rably, and even then there would be room for disputes.

doubt a very large number of mineral veins are
the contents of fissures; others are bands of rock
gnated with ore adjacent to fissures or planes of
tion; others, again, have been formed by the more
s complete replacement of the constituents of the
l rock by particles of ore.

ns may occur in igneous or in sedimentary rocks,
the latter they frequently cut across the planes of
cation.

a bed, a vein has its dip and strike; but, as the dip of veins
rally great, the inclination is usually measured from the
, and is then spoken of as the *underlie* or *hade*. The
g planes of a vein are called the *walls* or *cheeks*, and they
uently smooth and striated, showing that one side must have
ainst the other. The upper wall is known as the *hanging*
he lower one as the *foot wall*. The width of a vein is
d at right angles to the walls.

pical example of a fissure vein is shown in fig. 2, repre-
a lead lode in slate at Wheal Mary Ann mine[1] in Cornwall.

It is evident that a fissure in the surrounding slate has h
filled up by the successive deposition of bands of mineral
sides.

A large proportion of the contents of a lode may co
fragments of the walls that have fallen into the original fiss
these are often tightly cemented
together by minerals that have
been introduced subsequently. The
horizontal section of part of the
Comstock lode[2] (Plate IV.) shows
much "country" rock enclosed
within the walls.

Where a lode consists of rock
impregnated with ore, the mineral-
ized part may fade away gradually
into the surrounding rock (*country*)
without there being any distinct
wall, as shown in fig. 3, which is an illustration taken f
Great Flat Lode[3] near Redruth in Cornwall.

Fig. 2.

The celebrated Ruby Hill deposit in the Eureka district,
is a mineralized zone of dolo-
mitic limestone varying in
width from a few inches to
450 feet, and having a mean
width of 250 feet. It con-
tains numerous irregular ore
bodies, which consist mainly
of highly ferruginous car-
bonate of lead, rich in silver
and gold. This mineralized
limestone band, long called
a lode by miners, has been determined by the decision ge
tioned to be a lode in the eyes of the law.

Fig. 3.

Veins often continue for a great distance along their strik

ore, when an ore body forms
a sort of continuous column
we have a *shoot*, and ore
bodies which on being ex-
cavated leave chimney like
openings are called *pipes* (fig. 4, C). In the United St
Spanish word *bonanza*, literally meaning "fair weather"
sperity," is frequently used for a rich body of ore.

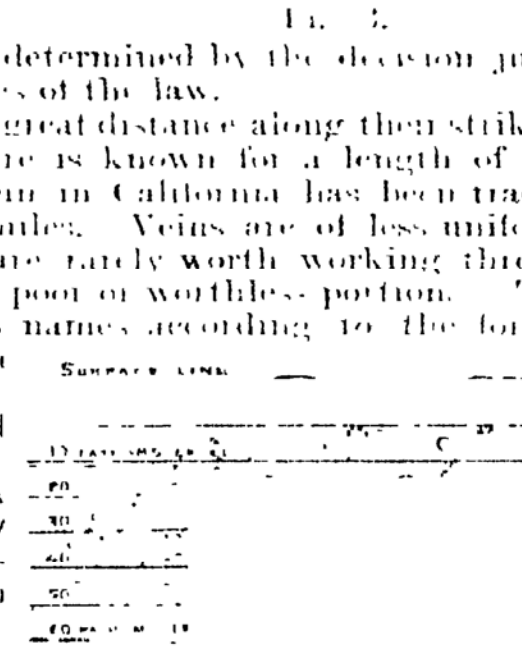

Fig. 4

The richness of veins is dependent in many cases upon th
of the adjacent rock (*country*), upon the underlie, and u
strike, variations in any one of these three elements bei
sufficient to cause a decided change of productiveness.

Various theories have been formed concerning the o
mineral veins. Some geologists suppose that the miner
constituting the veins have been dissolved out of the adjace
and re-deposited in the vein cavity; others, on the contrary
that the ores have been brought up from great depths by
springs. In all probability both theories are correct, so
having been formed by the former process and some by th
and, furthermore other lodes appear to owe their origin to a
substitution of valuable minerals in the place of some of
stituents of a worthless rock. One of the most import
tributions to the science of ore deposits of late years h
the discovery by Professor F. Sandberger of small quan
silver, lead, copper, nickel, cobalt, bismuth, arsenic, an
and tin in silicates, such as olivine, augite, hornblende, an
which are constituents of igneous rocks. He therefore
these rocks as the sources from which lodes have deriv
riches.

B. *Masses.* These are deposits of mineral, o
irregular shapes, which cannot be distinctly recogn
beds or veins. Such, for instance, are the red ha

variety of gypsum, called *briscale* by the miners, and considered by them as affording important indications concerning the bed itself.[1]

Other signs of mineral deposits are given by springs and by certain plants dependent upon the deposit or its associated minerals for part of their nourishment. The appearance of the so-called lode lights may be explained by the production of phosphoretted hydrogen from the action of organic matter and water upon phosphates, which are so common in the upper parts of mineral veins, and one hears also of differences in the appearance of the vegetation along the line of the deposit, of places where snow will not lie in winter, and of vapours hanging over the ground. Though some writers refuse to put any value upon these indications, they should not be entirely overlooked, because the outcrop of a lode, of different nature and texture to the surrounding rocks, and which is generally a channel for water, may readily cause the phenomena just mentioned. Where the surface is cultivated and the natural primes are tapped by adit levels or other mine workings, these appearances cannot be looked for to any great extent. With one special mineral, magnetic iron, the position of the deposit may be traced out with some degree of accuracy with a dipping needle, this being used in Sweden.

After having acquired an idea of the position of a vein or seam by some of the surface indications just mentioned, it is necessary, before attacking it by shafts or levels, to obtain more certain data concerning it. In the case of mineral veins, trenches are dug at right angles to the supposed strike; and, when the upper part of the deposit has been cut in several places, its general course and dip can be determined sufficiently for the purpose of arranging the future workings. These trenches are called "costeaning pits"; in some cases, instead of a trench, a pit is sunk a short distance and a little tunnel driven out.

Where the mineral to be wrought occurs as a bed or mass, the process of boring is resorted to, and indeed this method is also applied in the case of veins, especially in the United States. Boring is a work of such importance that it deserves to be treated under a separate heading.

3. *Boring with Rods and Ropes. Diamond Drill.* The object of boring is to reach a deposit by a small hole and ascertain its nature, its depth from the surface, thickness, dip, and strike. Bore-holes are also used for obtaining water, brine, and petroleum, which either rise to the surface or have to be pumped up from a certain depth, and finally for tapping water in old workings or for effecting ventilation. The methods of boring may be classified as follows: (1) boring with the rod; (2) boring with the rope; (3) boring with the diamond drill.

In the first method tools for cutting and removing the rock are fixed to rods, which are lengthened as the hole increases in depth, and which are worked by hand or by machinery at the surface. Where the ground is soft, such as sand or clay, tools like augers can be employed; but in harder ground it becomes necessary to have recourse to percussion; various forms of chisel are used, the simplest being made of the shape shown in fig. 11.[2] The rods generally consist of bars of square iron, from 1 inch to 2 inches on the side. The length of each rod depends upon the height of the tower, derrick, or shears erected above the bore-hole, which should be an exact multiple of the individual parts. These are made in lengths of 15 to 30 or rarely 40 feet, and with a suitable tower it is possible to detach or attach two or three lengths at a time, instead of having to make or unmake every joint. The mode of connexion usually preferred is by a screw joint as shown in fig. 12; care is taken to have all the joints exactly alike, so that any two bars can be screwed together. In order to

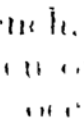

Fig. 11.—Chisels. Fig. 12.

diminish the weight of the rods, which becomes considerable in deep holes, wood has sometimes been employed. The rods are connected by male and female screws attached to the rods by sockets of sheet iron, or by a similar arrangement. At the surface a head is screwed to the uppermost rod by which the rods can be lifted, and are turned by means of cross bars called tillers.

When the depth is small the rods are lifted by hand and allowed to drop, being turned slightly at each lift so that the cutting chisel may strike a new place each time. For greater depths a lever has to be employed, the rod being suspended at one end whilst the other end can be pressed down by men using hands or feet. The spring pole is another arrangement, in which the elasticity of a long pole is made use of for lifting the rods at each stroke. The length of the stroke can be augmented the deeper the bore hole is deepened by means of a screw and swivel at the top of the rod.

With deep holes, and especially those of large diameter, machinery has to be employed for working the rods, which may be direct acting and stand immediately above the hole, but a commoner arrangement is to employ a jumper working a beam. Occasionally also the beam is actuated by connecting rod worked by a crank.

The actual boring machinery has now been described, but mere boring appears to be a very simple matter, consisting in lifting the rod a little and allowing it to drop, the rod being slightly twisted round after each stroke. Nevertheless the process of sinking down a bore hole is not so simple as it seems, for there are various indispensable accessory operations which take up much time. In the first place the debris have to be removed, and in order to effect this the rods must be drawn up, the swivel head unscrewed and a cap screwed on. A length of rods is now drawn up by a hand or steam windlass and disconnected. It is well to have as many cups as there are lengths to be drawn up, and then each can be suspended in the tower. Sometimes a *grab* which catches the rod at the bulging point is used instead of a cap. The next operation consists in lowering by means of a rope the *sludger* or *shell pump*, which is a hollow cylinder with a clack or shell valve (fig. 13). It is worked up and down a little till it is filled, and it is then drawn up and emptied at the surface. The operation is repeated, if necessary, and the boring is resumed with the rod.

Occasionally a bore hole has to be widened slightly with a tool called a *reamer*. Soft beds may have to be bored through with a *auger*, and under the rock are hard and firm, the hole has to be lined with a tube generally of boiler iron. Accidents may occur, causing no inconsiderable amount of trouble, such as the breaking of rods or chisel and numerous implements have been devised for seizing the broken or the fragments of tool which prevent further progress with the work.

In boring at considerable depth, the weight of the rod becomes so great that much vibration ensues when the mass is suddenly arrested by the chisel striking against the bottom of the hole. Various devices have been contrived for overcoming the difficulty and for reducing a tool which will act independently of the rod. One of the best known arrangements is the free falling tool invented by Kind, fig. 14. The head of the actual boring rod is held by a catch or grapple; when the boring rod descends, the resistance of the water in the hole slightly stops the clack (B), the jaws D open, the head is disengaged, and the boring part falls and strikes the bottom without any injurious vibrations being communicated to the heavier rod. When the rod descends further the head is caught again by the clack. Special tools also are used for cutting an annular groove at the bottom of a bore hole and breaking off the core, which is then brought up with certain precautions, so as to show the nature and dip of the beds traversed.

In order to obviate the great loss of time which ensues from connecting and disconnecting long lengths of rod, recourse may be had to boring with the rope. In this method, known as the Chinese method, the chisel is worked by a rope in the same manner as the sludger already described. Mather and Platt of Manchester have long used wire ropes, in many parts of England and various other countries, a system of boring by means of a flat hempen rope.[3]

The most important modification of late years

rocess of making bore-holes is the introduction of the iamond drill. The working part of the drill consists of he so called crown which is a short piece of tube made of ast steel, at one end of which a number of black diamonds re fastened into small cavities (fig. 15).

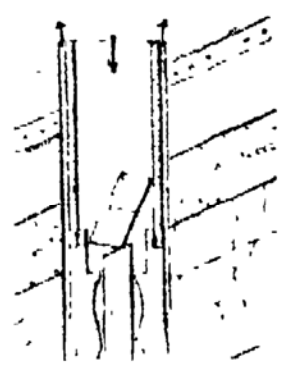

Fig. 15.—Diamond Drill.

The crown is screwed on to wrought-iron pipes, which constitute the boring od. Machinery at the surface causes he rod to rotate, and the result is the utting of an annular groove at the ottom of the hole, leaving a core, which, breaking off from time to time, s caught by a little shoulder, and rought up to the surface with the rod. n places where it is not necessary to make any verification of the rocks tra-ersed, the crown is arranged with iamonds in the centre also. The débris, in either case, are washed away by a stream of water, which is forced down the tube and flows up the sides of the hole. With this system a bore hole can be deepened continuously at a speed altogether unattainable by the other methods, which require stoppages for cleaning out. It has the further advantage of making it possible to drill holes in any direction, and prospecting diamond drills are constantly used with much success in iron, tin, and metal mines, especially in the United States.

Fig. 16[1] shows the Little Champion Rock-Drill, which is largely employed in the Lake Superior district for prospecting. It can be used above or below ground. Two inclined cylinders drive a horizontal crank shaft which works beveled gear, causing the drill to revolve. At the same time a counter shaft is slowly set in motion, and the effects the advance of the drill by gearing driving the feed screw, a there are three kinds of gearing, the speed can be varied at pleasure. The feed screw and its connections are carried by a swivel head, and this can be turned so as to drill holes at an angle. The drum shown above the cylinders is used for hoisting out the drill rods by a rope. The rods are lap welded iron tubes 1 inch in diameter, fitted with a bayonet joint.

Another light portable prospecting drill for underground work is

mounted upon a carriage, so that the whole machine is readily moved from place to place. The feed is effected by gearing or by hydraulic pressure; a 2⅝-inch crown is employed, leaving a 2-inch core. Each separate drill rod is 10 feet long. The total weight of the machine is about 4 tons.

4. *Breaking Ground—Tools Employed—Blasting by Various Methods—Machine Drills—Driving Levels and Sinking Shafts.*—The kind of ground in which mining excavations have to be carried on varies within the widest limits, from loose quicksands to rocks which are so hard that the best steel tools will scarcely touch them.

Loose ground can be removed with the shovel; but in the special case of peat sharp spades are employed, which cut through the fibres and furnish lumps or sods of convenient form for drying and subsequent use as fuel. What is called *firm, soft*, or easy ground, such as clay, shale, decomposed clay slate, and chalk, requires the use of the pick and the shovel. The pick is a tool of very variable form, according to the material operated on. Thus there are the navvy's pick, the single-pointed pick with a striking head at the other end called the poll pick (fig. 18), and numerous varieties of the double pointed pick (fig. 19), the special tool of the collier, but also largely used in metal mining. When the ground, though harder, is nevertheless "jointy," or traversed by many natural fissures, the wedge comes into play. The Cornish tool known as a *gad* is a pointed wedge (fig. 20). The so called "pick and gad" work consists in breaking away the easy ground with the point of the pick, wedging off pieces with the gad driven in by a sledge or the poll of the pick, or prizing them off with the pick after they have been loosened by the gad. The Saxon gad is held on a little handle, and is struck with a hammer. It is used for wedging off pieces of jointy ground, and in former days even hard rocks were excavated by its aid. The process consisted in chipping out a series of parallel grooves and then chipping away the ridges left between the grooves. As a method of working this process is obsolete, but it is useful on a small scale for cutting recesses (*hitches*) for timber, for dressing the sides of levels or shafts before putting in dams, and for doing work in places where blasting might injure pumps or other machinery.

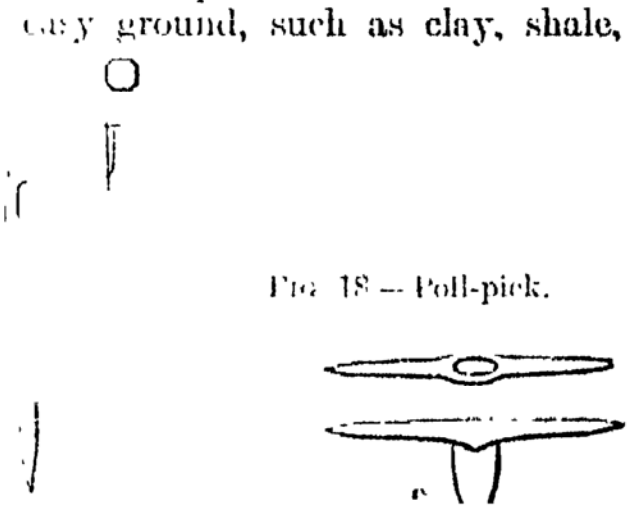

Fig. 18.—Poll-pick.

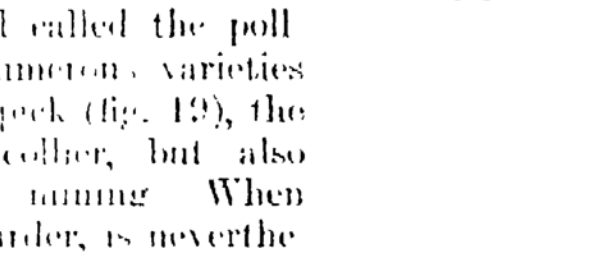

Fig. 19. Double-pointed Pick.

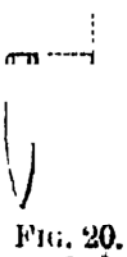

Fig. 20.—Gad.

We now come to hard ground; and in this class we have a large proportion of the rocks met with by the miner, such as slate of various kinds, hard grits and sandstone, limestone, the metamorphic schists, granite, and the contents of many mineral veins. Rocks of this kind are attacked by boring and blasting. The tools employed are the jumper, the borer or drill, the hammer, the sledge (*mallet*, Cornwall), the scraper and charger, the tamping bar or rammer, in some places the pricker or needle, the claying bar, the crowbar, and finally the shovel for clearing away the broken rock.

Fig. 21.

The jumper (fig. 21) is merely a long bar of iron terminating in two chisel-like edges made of steel; generally there is a swelling in the middle, and sometimes the jumper tapers all the way from the middle to the edge or bit. The jumper is most commonly used when it is necessary to bore holes downwards, and is

largely employed in quarries; occasionally it is used in boring holes horizontally, as for instance in the salt mines of Cheshire. The jumper is held in the desired direction, lifted up, and thrust down; it is turned a little after each stroke.

However, the miner's tool is generally the borer proper, or drill (fig. 22), which is a bar of round or octagonal steel, usually from $\frac{7}{8}$ inch to $1\frac{1}{4}$ inches in diameter, with one end forged into a chisel-shaped edge, the exact shape and degree of sharpness varying according to the hardness of the rock. The hole is bored by striking the drill with a hammer or sledge and turning it after each blow. Boring is said to be single-handed if the miner holds the drill in one hand and strikes with the hammer in the other, whilst it is called double-handed when one man turns and another strikes. The hammers for single-handed boring usually vary in weight from 2 to 6 or 7 lb.

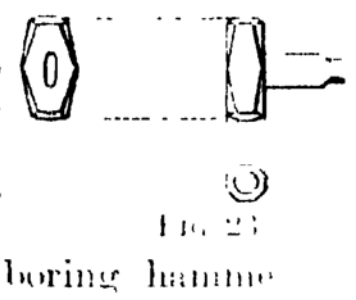

Fig. 22.

The double-handed boring hammer weighs from 6 to 10 lb or more. The hole is bored downwards, the miner pours in a little water and leaves the hole wet. From time to time he draws out the sludge with the scraper, a little disk at the end of a metal rod, and he takes a fresh borer when the tool he is using has become blunt. The depth bored varies with the rock and the nature of the excavation; but in driving levels in the ordinary way the depth is commonly from 18 inches to 3 feet.

Holes for blasting are sometimes bored by tools like carpenters' augers. One of the simplest, which is used in some French slate-mines, is very like a brace and bit, and the tool is kept pressed against the rock by means of a screw fixed in a frame resting on the ground.

The pricker, or needle, is a slender tapering rod of copper or bronze, with a ring at the large end. It is used for maintaining a hole in the *tamping* through which the charge can be fired. The use of needles made of iron is prohibited in many countries, on account of the danger of their striking sparks which might fire the charge. The tamping bar, or *stemmer*, is a rod of iron, copper, or bronze, or iron shod with copper, and it is used for ramming in dried clay, slate pounded up, or other fine material, upon the powder, and so creating a resistance sufficient to make the gases generated by the explosion the charge rend the rock in the manner required. The aying bar is used for lining wet holes with clay, and rendering them temporarily watertight.

Shovels vary much in different districts. In the south-west of England the long-handled shovel is preferred to the common one with a short handle, in Germany the ore or rubbish is frequently scraped into a tray with a sort of hoe.

In addition to these tools the miner requires an explosive, and a means of firing the charge at the bottom of the hole which will give him time to escape. Twenty years ago gunpowder was the only explosive in common use in mines, but at the present day its place has been taken to a very large extent by mixtures containing nitro-glycerin or gun-cotton. The powder used for blasting in mines usually contains less saltpetre than that which is employed for sporting or military purposes. The following is an analyses of mining powder by Captain Noble and Sir F. Abel[1]:

Saltpetre	61·66	Oxygen..	
Potassium sulphate	0·12	Ash	0·59
,, chloride	0·14	Water	1·61
Sulphur	15·06		
Carbon	17·93		100·00
Hydrogen	0·66		

[1] "On Fired Gunpowder," *Phil. Trans.*, 1880, p. 225.

Gunpowder compressed into cylinders of diamet suitable for bore-holes, and provided with a central h for the insertion of the fuse, has lately been brou forward with some success.

Nitro-glycerin or glyceryl nitrate is a light-yellow o liquid which is very sensitive to shocks; under the act of a fulminating cap it explodes with great violen Its chemical composition is expressed by the form $C_3H_5(NO_3)_3O_3$ or $(C_3H_5)3NO_3$: its specific gravity 1·6. It has been found so dangerous that its use itself has been given up, but on the other hand the m ture of nitro-glycerin and infusorial earth (*Kieselguhr*) cal dynamite or giant powder is now one of the common explosives met with. It has the advantage over powe that it is far more powerful, that it may be used in w holes or under water, that it is very effective even ground full of "vughs" or cavities, and that it requires hard tamping, which is always a source of danger. plasticity too enables it to fill the space at the bottom o bore hole, which is rarely a true cylinder, more complet than any solid cartridge can do. One di-advantage that it has to be thawed in cold weather, and there is a the fact that occasionally the whole of a charge of dy nite fails to go off, and unnoticed remnants have explod and caused serious and even fatal accidents when str with the pick or borer. The danger is enhanced when t remnants have been left in contact with water, which can a separation of the sensitive nitro-glycerin, so that eve blow upon the adjacent rock may lead to an accident any of the explosive oil has leaked into cracks. T strongest dynamite contains about 75 per cent. of nit glycerin, the rest being kieselguhr. A newer explosive blasting gelatin, it is made by mixing nitro-cotton w nitro-glycerin, until enough nitro-cotton has been dissolv to convert the nitro-glycerin into a jelly-like mass. T blasting gelatin in ordinary use contains no less than per cent. of nitro-glycerin, with 7 per cent. of nitro-cott and its strength is very great.

Gun-cotton *per se* is not much in favour in ordina mining, but mixed with some nitrate or mixture nitrates, such as the nitrates of barium and potassium, a known as cotton powder, tonite, and potentite, it employed extensively. Though not quite so powerful dynamite, nitrated gun-cotton possesses the importa advantage of not requiring to be thawed in cold weath As in the case of dynamite, accidents have been caused remnants of charges, and with both explosives it is nec sary to examine carefully the bottoms of all holes af blasting, and to destroy any possible remnants by firing a detonator in any bottom or "socket" which cannot w certainty be pronounced free from danger.

The commonest method of firing a charge is by me of the *safety fuse*, a cord containing a core of gunpow introduced during the process of manufacture, it may rendered waterproof by tar or gutta percha.

In blasting in the ordinary way the charge of gunpowder is no other loose or in bags or paper bag and it is pressed dow the bottom of the hole with a wooden stick, whilst a piece of also inserted extending from the charge well beyond the h If the powder is loose the miner carefully wipes down the sid the hole with a wet *scraper* or wooden rod with the hair-l at one end, or with a wisp of hay twisted round the scraper, order to remove any loose grains adhering to the fuse or the s of the hole, and then presses in a wad of hay or paper. A h fine tamping often the dust from boring a dry hole is now thro in and rammed down with the wooden charge-rod, and the s process is repeated, and when harder tamping is required the m bar is brought into operation, until the hole is completely filled

As the safety fuse burns slowly, at the rate of about 2 or 3 a minute, the miner can secure ample time for retreat by takin sufficient length. It is usual to ignite the fuse by a candle- fixed under it by a piece of clay, and it takes a little time for candle to burn through the fuse.

The old plan of firing a charge, which is still in use in m

places, consists in inserting the needle into the charge and then
amping up the hole [illegible] to draw out the needle a little
s the tamping pro[illegible] prevent too much force being r
quired for practical w[illegible] The small hole left in this way

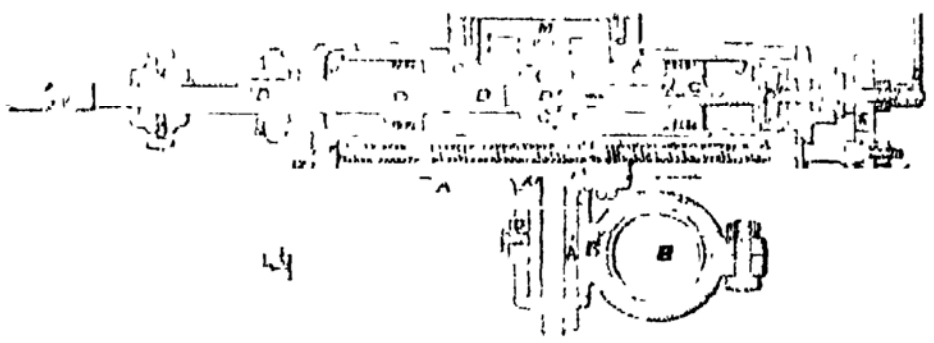
[illegible], and [illegible] second wire of the first and last hole are
[illegible] to the two cores of a single cable, or to two separate
[illegible]ables [illegible] place of safety to which the men can
[illegible]retire. [illegible] wires are connected by binding screws
[illegible] to a [illegible] and a powder. A few turns
[illegible] the handle [illegible] and by pressing a knob or by
[illegible]ome other [illegible] the [illegible] pleted and the discharge
[illegible]ffected. The electricity [illegible] rough the fuse wires making
[illegible]park at each hole [illegible] [illegible] the gunpowder composition
[illegible]The flame flashes through [illegible] and ignites the fulminating
[illegible]ercury I, the detonation [illegible] the explosion of the
[illegible]ammate, bursting [illegible] [illegible] the cap.

One great advanta[illegible] [illegible] before firing is that the miner
[illegible]an retire to a perfectly [illegible]afe place before attempting to
[illegible]xplode the charge. This is important in sinking shafts,
[illegible]here the means of escape are less easy than in levels.
A second advantage is that there is no danger of a "hang
fire," an occasional source of accidents with the ordinar
safety fuse.

One of the greatest improvements in the art of minin
during the last few years has been the introduction
machinery for boring holes for blasting; most of th
machines imitate percussive boring by hand, but a fe
rotary machines are also in use. A percussive drill
perforator consists of a cylinder with a piston to whic
the drill is fastened. Compressed air is made to a
alternately on each side of the piston, and in this manne
the drill receives its reciprocating motion. Variou
arrangements have been adopted for securing the automat
rotation of the drill. In some cases also the advanc
forward of the machine, as the hole is deepened, is als
effected automatically, but in many of the best drills th
work is left to the man in charge. It is impossible withi
the limits of this article to describe the various drills no
in use, or even to make a complete enumeration of them.

The following, in alphabetical order, are the names of some
the best known drills: Barrow, Beaumont, Burleigh, Champion
Cornish, Cranston, Darlington, Desideratum, Doering, Dubo
and Francois-Dumesnil, Eclipse, Excelsior, Ferroux, Frohlich, Inger
oll Leyner, Mackie, Osterkampf, Rand, Roanhead, Sandycroft
Schram. An account of two of the simplest, the Barrow and th
Darlington drills, will be sufficient to give a general idea of th
construction of the machines.

"The Barrow drill (fig. 27) consists essentially of a gun-meta



cylinder C about 2 feet in length and 4 inches in diameter, i
which works a cast-steel piston-rod D, fitted with two pistons
about 12 inches apart, and midway between which is the tappet,
box, G. In a valve box on the top of the cylinder is placed th
oscillating slide valve H (shown separately), hinged at M, whic
is worked by the reciprocation of the tappet G' coming in co
tact with the lever edges, which for this purpose are formed wit
two lugs at each end, as shown. It has ports corresponding
with openings in the slide valve face for admitting the fres
charge of compressed air from the inlet pipe I (fig. 28) to th

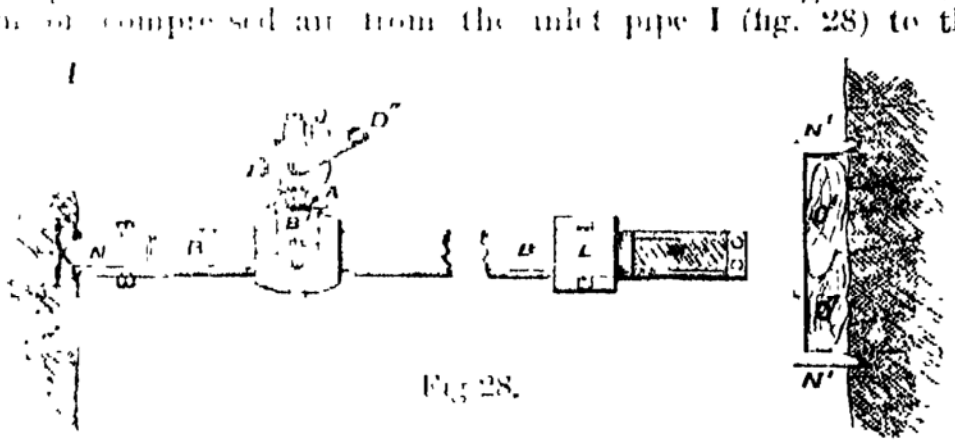


Fig. 28.

ports a at each end of the cylinder, and for letting the spent
exhaust air or steam escape by the exhaust pipe J. This simpl
arrangement constitutes the whole valve gear of the machine.

"The borer is inserted into a hole formed in the fore end of th
piston rod, and is fixed therein by means of a screw. Its rotatio
is effected by hand by means of the handle D", turning a spind
D', which is fitted by means of the cotter *d*, made fast in th
piston D, and fitting in a slot in the spindle D', that the latt
can slide in the piston D, but when turned by the handle caus
the piston to turn with it. The spindle D' has a pinion E gearin
into the pinion F, on the adjusting and feeding screw C', so th
when the piston D is turned by means of the handle D" th
cylinder C is simultaneously pushed along the bed-plate A. The
pinions can be easily disconnected by loosening the nut *f*, and th
the piston and the adjusting screw can be turned independently
one another when required.

"The borers used are respectively 1¾ inches, 1⅝ inches, and 1 inc
in diameter, the length of the stroke 4 inches, and the maximu
number of blows about three hundred per minute. The air

lown about 400 fathoms from surface, at a pressure of 50 to
ne square inch, in wrought iron pipes 2 inches in diameter in
and 1¼ inches in the level, and admitted through a flexible
the inlet I on the left hand side of the cylinder. The cost
es is rather under 7d. a foot, or about 3s. 3d. per fathom
compressed at the surface by a 14 inch compressor, worked
nch horizontal engine, capable, however, of working two

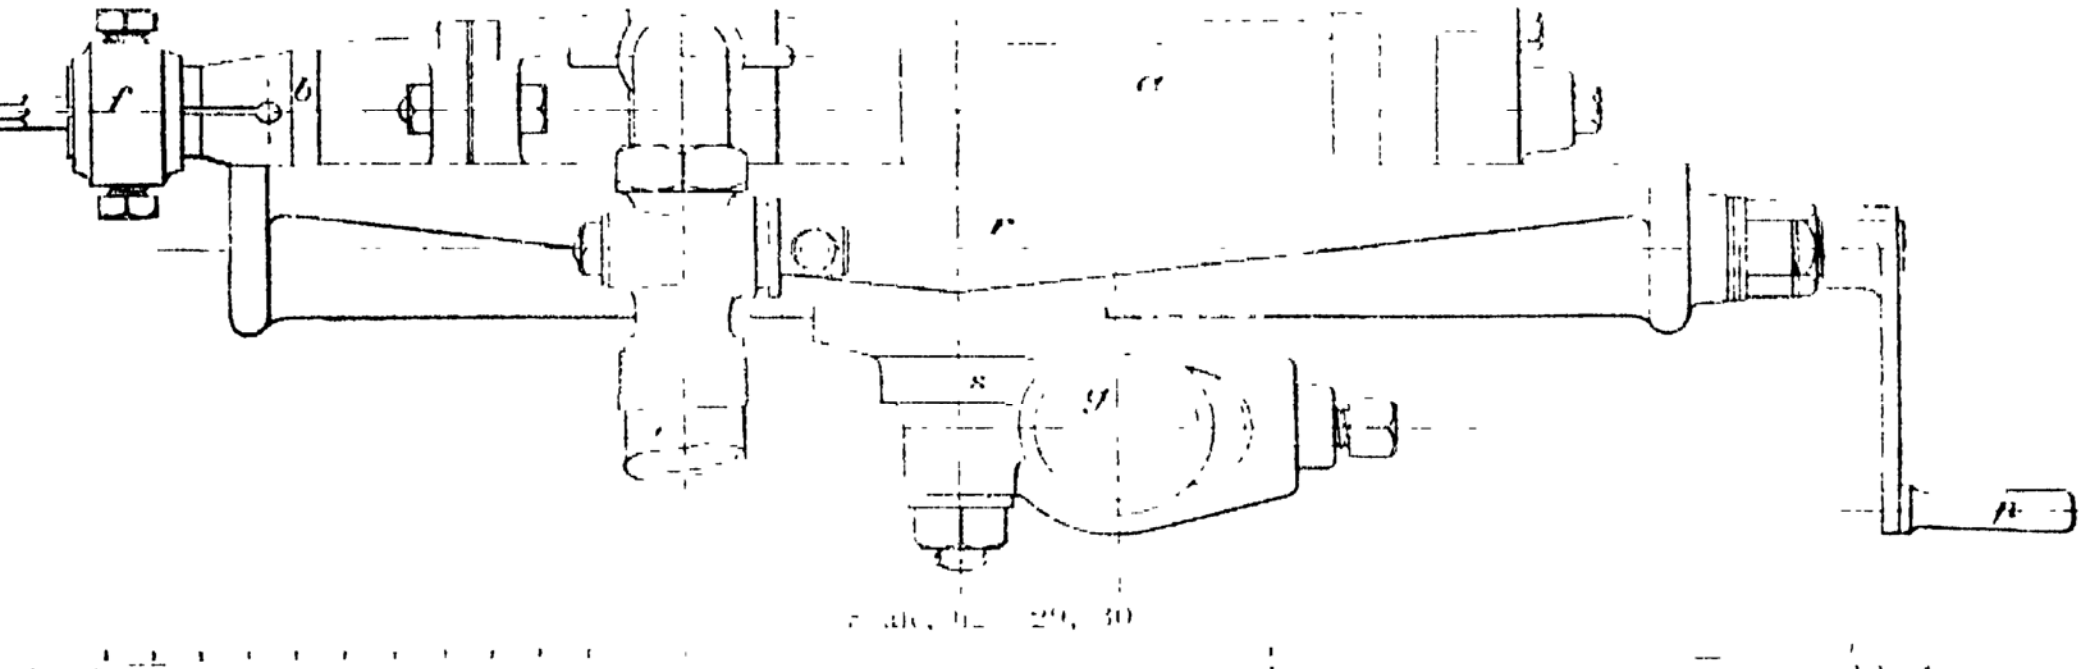

Fig. 29.—Side Elevation of Darlington's Rock Drill.—Scale ½.

laced in position either horizontally or vertically as may
convenient, but is generally placed across the level, against
s of which it is secured by means of the clamp L, and

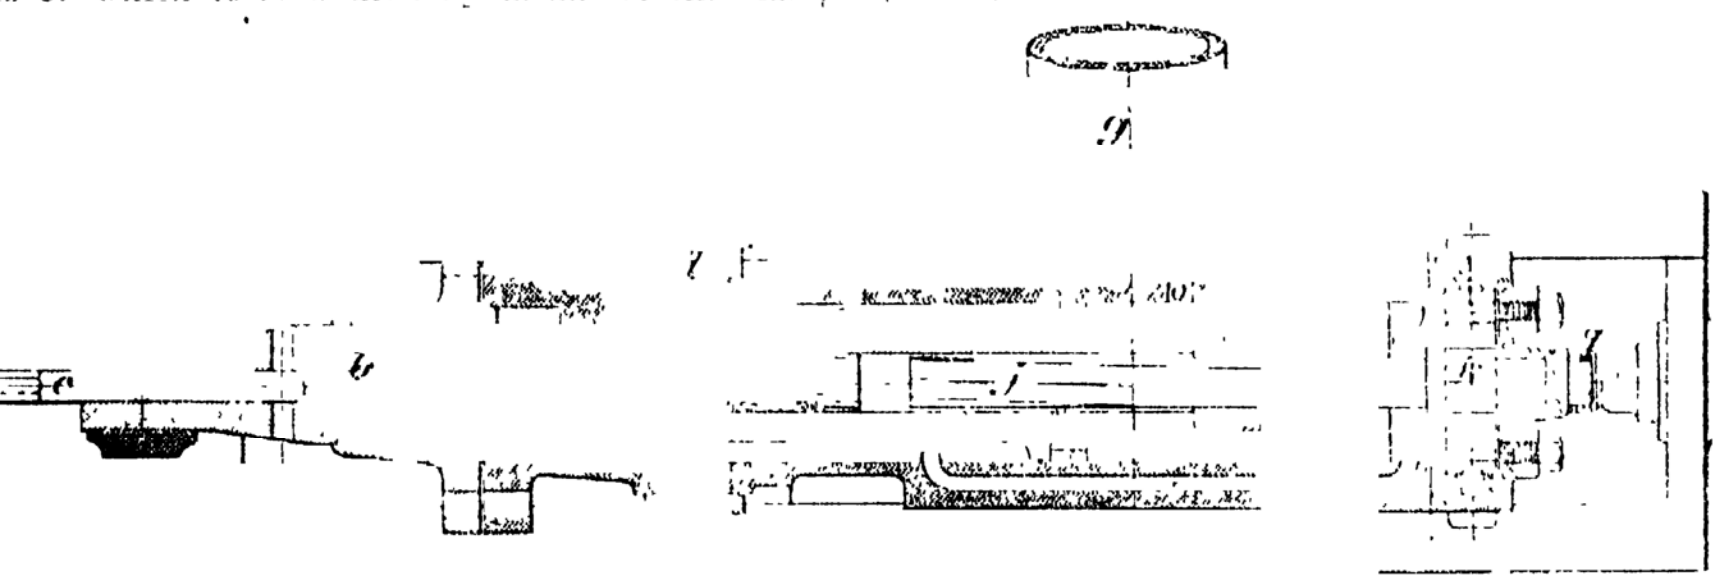

Fig. 30.—Horizontal Section of Darlington's Rock Drill.—Scale ½.

adjusting screw M, and clasps N and N'. If necessary, a wooden
wedges O, O' are driven in between the laws and the wall to make
it still firmer. The weight of the bar is about 120 lb."[1]

mpressing plant of greater size has now been erected at
h mine, to which the above description refers. At Snail
ine in Shropshire they have two air compressors of 18 inches

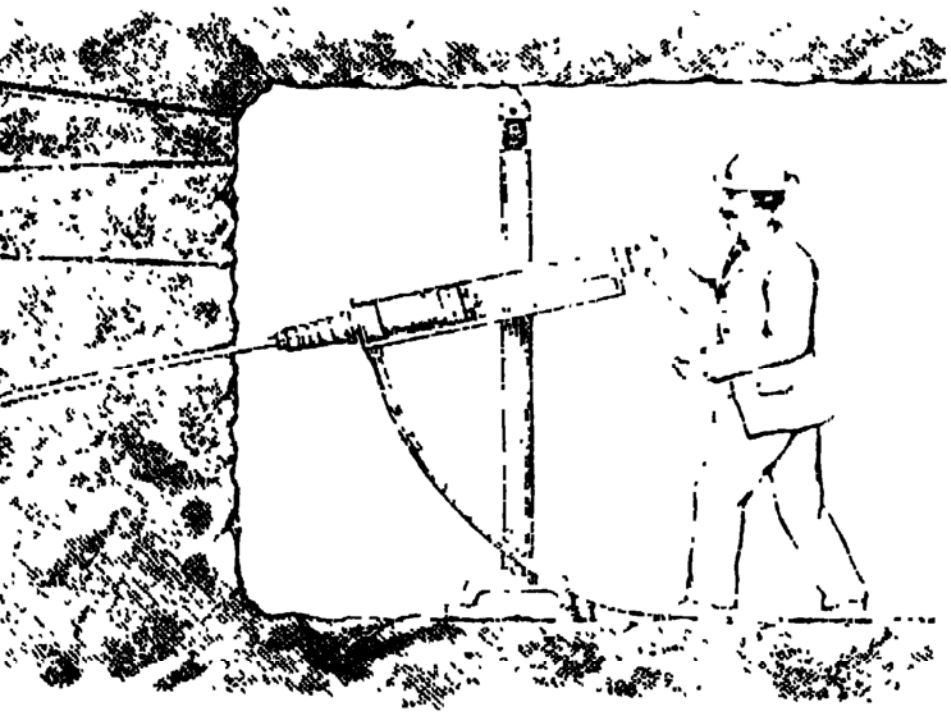

Fig. 31.

er and 5 feet stroke; the air-main is at first 9 inches in dia-
then 6 inches, whilst 2-inch gas pipe is used in the levels
ck-drill which has done, and is doing, excellent work is that
of Mr John Darlington. Its construction will be understood by
referring to figs. 29, 30 and 31, *a* is the cylinder, *b* the piston rod
c the lever, *d*, *d* the two openings for admission of compressed air
either of which may be used according to the position of the drill
e the inlet box with a top piece, *f* drill bonnet, *g* stretcher bar
h piston, *i* rifled bar for turning piston and drill, *k* ratchet wheel
attached to rifled bar, *l* rifled bush fixed in the piston head, *m* wood
for lessening weight of piston rod and blocking piece, *n* portway for
allowing the compressed air to pass to the top of the piston and give
the blow, *o* bush, *p* portway. The action of the drill is as follows:
The compressed air is admitted at *d* to the underside of the piston
and when the upper side of the piston communicates with the outer
atmosphere through the portway *n* the piston is forced backward and uncovers the
exhaust port *o*, and the air rushes through and presses against
the upper side of the piston, which has a greater area than the lower
side, the difference being equal to the area of the piston rod. The
piston is driven upward, and the drill strikes a blow
At the same time the exhaust port *o* and then the compressed air passes on to the annular area on the underside of the piston
producing the return stroke. The number of blows per minute
hole is limited to eight hundred. The rotation of the drill is
effected by the rifled bar. On the down stroke of the piston the
bar with its ratchet wheel is free to turn under a couple of pawls
and consequently the piston moves straight whilst the bar and
ratchet wheel turn. When the up stroke is made the ratchet
wheel is held by the pawls and the piston is forced to make part of
a revolution. As the hole is deepened the cylinder is advanced
forwards by turning the handle *p*, this working an endless screw

[1] *Proc. Mining Institute of Cornwall*, vol. i., 1877, p. 12.

assing through a nut attached to the cylinder; *r* is the cradle rrying the feed screw and supporting the cylinder. It is centred the clamp *s*. As the clamp can be fixed in any position on the ar, and as the cradle can be turned on the clamp, it is evident hat holes can be bored in any direction.

In driving a level with the Darlington drill it is usual to fix the retcher bar horizontally across the level so as to command the pper part of the face, holes can then be bored with the cradle bove the bar or below it. The bar is then lifted low enough to ore the bottom holes. It is found that all the necessary holes can e bored from two positions of the bar. The bar therefore has imply to be fixed twice; the alterations in position for boring holes various directions are managed by shifting the clamp on the bar nd turning the cradle on the clamp. Fig. 31 shows the stretcher ar fixed in a vertical position which is sometimes convenient.

In order to wash out the loose from holes that are looking ownwards a jet of water, supplied from a hose attached to a half nch gas pipe leading from a cistern at a higher level, is made t play into the holes during the process of boring.

For sinking shafts Mr Darlington has the drill fixed in a cylin rical case with a large external thread which works in a nut or amp. The drill is fed forwards by turning a hand wheel attached o the case.

Rotating machine drills are also used in mines as well those with percussive action. Stapff pointed out some ears ago that, if a rock may be chipped off by power com unicated by a blow, it may also be chipped off by a similar mount of power communicated by pressure. Brandt's otatory boring machine consists of a hollow borer which as a steel crown with cutting edge screwed on. The ool is kept tight against the rock by the pressure of a olumn of water, and is at the same time made to rotate y two little water pressure engines, whilst a stream of water passing down through the borer washes away the débris and keeps the cutting edge cool. In principle, herefore, the drill resembles the original diamond boring machine of De la Roche Tolay and Perret, save that the rown is made of steel and not of diamonds. During the ast few years it has been tried with success in railway unnels and in mines. Darlmuck's drill acts also by otation, but the borer is fed forwards and pressed against he rock by a differential screw arrangement. The machine an be worked by hand, or by a little water pressure or ompressed air engine or an electro motor. In working ertain minerals occurring in seams the undercutting may e performed by machines similar to those used in coal ines (see vol. vi. p. 68).

We now come to the application of the tools and machine drills to the purpose of breaking ground for driving levels nd sinking shafts.

A level or drift is a more or less horizontal passage or unnel, whilst a shaft is a pit either vertical or inclined. n driving a level by hand labour in hard ground, the first bject the miner has to do is to blast

et a preliminary opening in the "end" or "forebreast". The position of this cut is determined by the joint, which ' miner find carefully so as to obtain the greatest dvantage from these natural planes of division. This- which, owing to joints, it was

dvisable to begin with a hole No. 1, and then bore and blast 2, 3, and 4 one after the other. The miner as a rule does not plan the position of any hole until the previous

Österreichische Zeits. für Berg- und Hüttenwesen, 1881.

one has done its work; in fact he regulates the position and depth of each hole by the particular circumstances of the case. Though a vein and its walls may be hard, there is occasionally a soft layer of clay (DD, DD, fig. 33) along one wall (*dig*, Cornwall: *gouge*, United States). The miner then works this away with the pick, and, having excavated a groove as deep as possible, he can now blast down the lode by side holes and so push the level forward.

In sinking a shaft a similar method of proceeding is observed. A little pit (*sink*) is blasted out in the most convenient part, and the excavation is widened to the full size by a succession of blasts, each hole being planned ording to circumstances. This series of operations is repeated, and the shaft is thus gradually deepened.

Where boring machinery is employed, less attention, and sometimes no attention, is paid to natural joints, because when once the drill is in its place it is very little trouble to bore a few more holes, and the work can then be carried on according to a system which is certain of effecting the desired result.

A common method of procedure for hard ground is shown in figs. 34 and 35. Four centre holes are bored about a foot apart at first, but converging till at a depth of 3 feet they are within 6 inches, or less, of each other. Other holes are then bored and them until the end is pierced by twenty or thirty holes in all. The four centre holes are then charged and fired simultaneously, either by electricity or by Bickford's instantaneous fuse, and the result is the removal of a large core of rock. The holes round the opening are then charged and fired, generally in volleys of several holes at a time, and the level is thus carried forward for a distance of 3 feet. If the ground is more favourable fewer holes are required, and they may be bored deeper,- in fact as much as 6 feet in some instances. Occasionally the four centre holes are directed so that they meet at the apex of an acute pyramid, and then, after all have been charged with blasting gelatin, only one of them receives a primer and cap; the shock of the explosion of one charge fires the other three adjacent charges simultaneously. The preliminary opening is not necessarily made in the centre of a level, and sometimes it is blasted out in the bottom or one side.

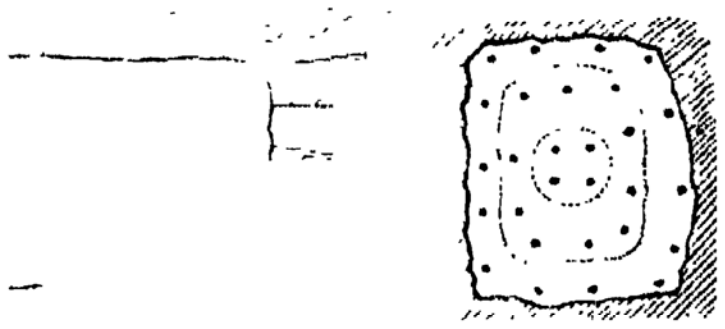

Fig. 35.

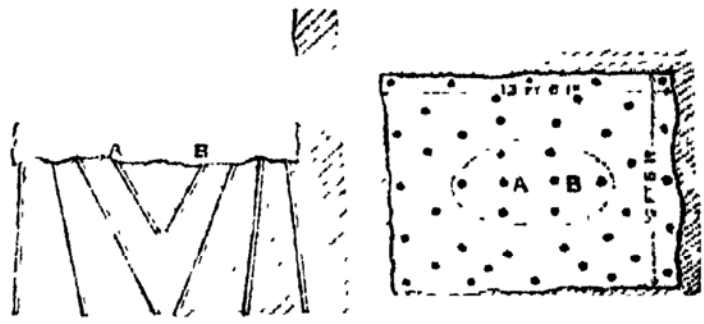
In sinking shafts by boring machinery operations are conducted much in the same way as in driving levels, except of course that the holes are directed downwards. Figs. 36 and 37 are a section and plan of a shaft which has been sunk by the Foredale mining company in the Isle of Man. About forty feet from the bottom of the shaft the holes



A B

d F Fig. 37

blasted with ordinary fuse. They serve simply to smash up and weaken the core, then the six holes nearest the centre, which are 8 feet deep, are blasted all together with Bickford's instantaneous fuse and the result is the removal of a large core leaving a deep *sink*. The remaining holes are fired in volleys of a time in the ordinary way. In this manner the shaft, which is in hard granite, is being deepened at the rate of 3½ or 4 fathoms a month. Tonite is the explosive used.

Sundry machines have been invented and used for driving levels without blasting. Some cut up the face into small chips which can

easily be removed, but they have not made their way at present into ordinary mining. The Bosseyeuse of MM. Dubois and François acts on a different principle. It is a strong machine worked by compressed air. It first of all drills holes 4 inches in diameter by percussion; a striking head is then substituted for the drill, and wedges, on the principle of the plug and feathers, are inserted into the holes; and powerful blows with the striking head wedge off the rock in lumps. This machine is being used with success in Belgium for driving levels and crosscuts in fiery mines.

Some comparative experiments between hand labour, a percussive drill, and a rotatory drill have lately been made in one of the Freiberg mines,[1] and the results are of much interest and importance. The actual figures are as follows, the cost including, in the case of the machines, interest, depreciation, and cost of repairs, and cost of steam power, supposing water-power not available:

	By hand	By Schram's Drill	By Brandt's Drill
Distance driven per week (in metres) ...			
Cost in marks per metre driven... ...			
Wages realized by the miners, in marks, per hour's shift			

The advantages of machine work are very great both as regards rate and cost of driving, and were fully attained by the use of Brandt's rotatory drill did its work cheaper and faster than Schram's machine; but nothing is said in the communication about the relative cost of a machine driven by compressed air for ventilating which is used in advanced headings in which these drills are employed.

Brandt's machine was worked with water at a pressure of 8·5 atmospheres, of which 5·6 atmospheres were obtained by the pressure pumps provided with an accumulator and 2·9 atmospheres by natural fall, owing to the working level being 297 metres below the pumps. The water was conveyed to the machine in pipes of 1½ inches diameter inside. The diameter of the hole bored was 2⅜ inches, and they could be bored to a depth of 1·5 inches per minute. The stretcher bar on which the machine is mounted is hollow, and has a piston which can be forced out by hydraulic pressure so as to fix the bar firmly. A similar bar is sometimes used with percussive drills.[2]

As a method of breaking ground the action of fire-setting requires to be mentioned. Before blasting was known it was largely employed, but its use is now confined to a few places on the Continent where the rocks are exceedingly hard and where wood is abundant and cheap. Piles of wood are heaped up against the face of the working and set on fire. On returning to the work a day or two or three days afterwards, when the rock has cooled a little, it is found that the ground has split and flaked off, and that much has been loosened which can be removed easily.

We finally come to water as an agent for [illegible]. Streams of water were formerly used in South Wales for [illegible] beds of clay ironstone at the outcrop. The water washed away the clay and shale and left the clean nodules of ore. The china clay of Cornwall is also worked by water. A stream of water is turned on to the soft mass, and the workmen loosen the ground with a pick; the water carries off the [illegible] rock in suspension to regular settling pits. Water under pressure has rendered vast services to the miner in working auriferous alluvia. The system is described and figured at p. 74 of vol. [illegible], so it is unnecessary here to enter into details. In the case of salt-mines recourse may be had to the solvent action of water directed by suitable nets, for making excavations.

5. *Principles of Employment of Mineral Labour.* As a large proportion of the expenditure in mining is for actual manual labour, it is very important that means should be taken to prevent any waste in this department. Three principles are in vogue: payment by time, by work done either measured or weighed, and by the value of the ore extracted.

The overseers, called captains in many metal mines, are naturally paid by the month, and where strict supervision can be exercised, such as is possible at the surface, on the dressing floors for instance, the same principle may be adopted; but when men are working underground, and often in small gangs of only two or three persons at some distance apart, piecework of some kind is more economical and satisfactory in every way.

In driving levels and sinking shafts it is usual for the men to work at a certain price per running yard or [illegible]. The agents have to see that the excavation, whether driving or level, is maintained of the full dimensions agreed upon and preserved in the proper direction. At the end of a certain time, generally a month, the work is measured by the agent. From the gross amount obtained by measuring the price by the number of fathoms driven or [illegible] is necessary to deduct the cost of the materials supplied to the men by the mining company, such as explosives, candles, &c., and the remainder is divided among the persons who took the contract. When the useful mineral is being obtained the men may be paid at so much per cubic yard or fathom excavated, or at so much per ton of mineral extracted, the overseer of course having to see that in the latter case, that worthless rock is not sent to the surface. Payment by the number of inches bored is a method in use in some countries, where the men are not experienced or enterprising enough to undertake the work in any other way. A foreman points out to the men the position and direction in which the holes must be bored, measures them when completed, and subsequently charges and fires them.

The third method is that which is known as the "tribute" system. The miner working on tribute undertakes to extract and dress the ore in a certain portion of the mine which is assigned to him and called his *pitch*. He gives to the mining company all the ore he extracts at a certain fixed proportion of its value, after he has paid all the cost of getting it, hoisting it to the surface, and dressing it. Thus, supposing he takes a pitch at 5s. in the £, and produces marketable copper ore of the value of £250, his share will be 50 × 5s. = £12. 10., less the cost of the materials which he has been supplied with, and all expenses for [illegible] charges, sampling, &c.

6. *Means of Securing Excavation by Timber, Masonry, &c.* The following kind of timber are the most frequently employed for securing excavations under ground: oak, larch, pitch pine, pine, fir, and occasionally beech. To minimize the tendency to rot which timber is subject to by dry rot, which gradually reduces it to powder, and when the timber is often renewed the expense may be very considerable, various methods of preventing dry rot have been tried with more or less success, such as letting water trickle over the timber in the mine or treating it with preservatives beforehand. Brine, creosote, and solutions of chloride of zinc, sulphate of zinc, sulphate of copper, and sulphide of iron, increase the duration of timber. It was found by experiments carried out at Community Grube, Silesia, during a series of years that one of the best plans was to steep the timber for twenty four hours in a strong solution of sulphate of iron. The total cost was only 3d. per yard of prop, and the timber lasted eleven times as long as when the preservative treatment was omitted.

Timber is used in various forms, either whole and unsawn into levers, or squared up, or sawn in half, or into planks of various thickness.

Where the roof of the level is weak, props are used, but in some coal mines and clay ironstone mines the roof is supported by horizontal beams (*couples*) laid from prop to prop crosswise (fig. 58).

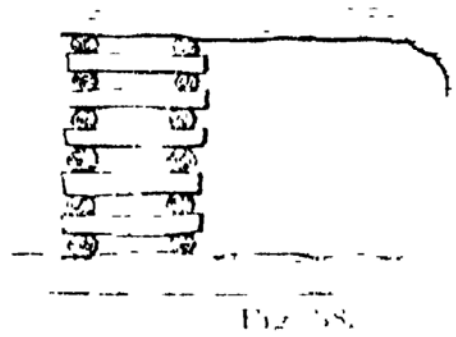


Fig. 58.

Though the excavation of a level is a very simple matter, the method of timbering it varies considerably, because the parts requiring support may either be the roof alone, or the roof and one or two sides, or the roof, sides, and bottom.

If the roof only is weak, as is the case with a soft lode between two hard walls, a *cap* with a few boards resting on it is sufficient to prevent falls. If one side is weak the cap

[1] *Jahrbuch fur das Berg- und Hüttenwesen im Königreiche Sachsen auf das Jahr* 1882, p. 18, and abstract in *Proc. Inst. Civ. Eng.*, vol. lxix., 1881–82, part iii. p. 51.

[2] *Annales des Mines*, ser. 8, ii., pl. 1, fig. 6, 1882.

oported by a side prop or *leg* (fig. 40), and very often by two gs. The forms of joint between the cap and leg are numerous

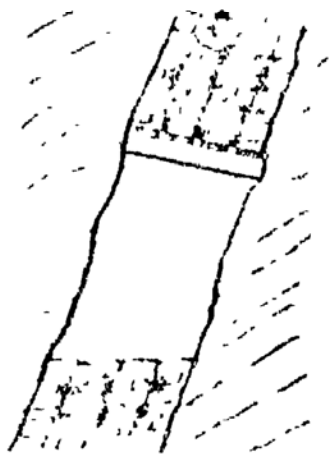

Fig. 39

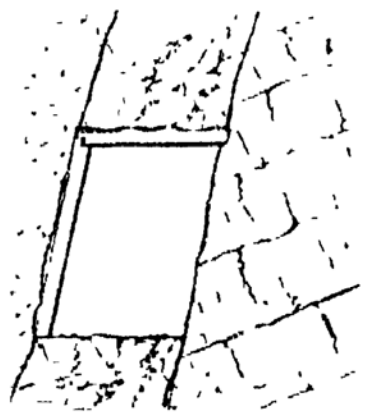

Fig. 40

g. 41), depending to a great extent upon the nature of the pres re, whether coming upon the top or sides. With round timber e top of the leg is metimes hollowed shown in fig. 42 but occasionally joint is flat and thick nail, or *spur*, put in (fig. 42 B)

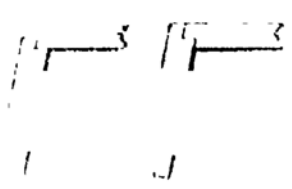

Fig. 41.

Fig. 42

prevent the effects of side pressure, or, better, a piece of thick nk is nailed under the cap (fig. 43). Where the floor of a level soft and weak, a le piece or *sill* be mes necessary, and, the sides or roof are ely to fall in, a ning of poles or anks is used (fig. 43) In some very heavy ound in the Com- ock lode a special stem of timbering is opted (fig. 44)

Fig. 43.

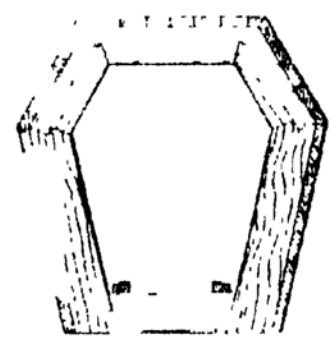

Fig. 44.

If the ground is loose, so that the roof or sides, or both, will run unless immediately supported, the method of working called *lagging* or *poling* is pursued. It consists in supporting the weak rts by boards or poles kept in advance of the last frame set up. e poles or boards *aths*) are driven ward by blows om a sledge, and ground is then orked away with pick, as soon as sufficient advance s been made a new ame is set up to pport the ends of poles or boards d the process is re ated in fig. 45 and

Fig. 45

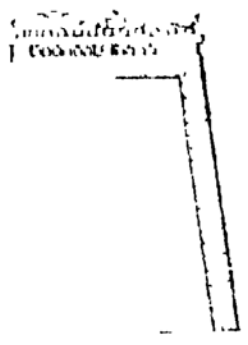

Fig. 46

In running ground it is necessary to have the lath-timbering ck together, and the working face also must be supported by e.g. lags in place by little struts resting against the frame- ces are removed and advanced one by one after the laths h ve been driven beyond them

To a consideration of the high price of timber, must sometimes ad ed the difficulty of obtaining it in many districts. One method is that of building walls of rubble masonry, into the form shown in fig. 47, and making it ample for the roof to rest on

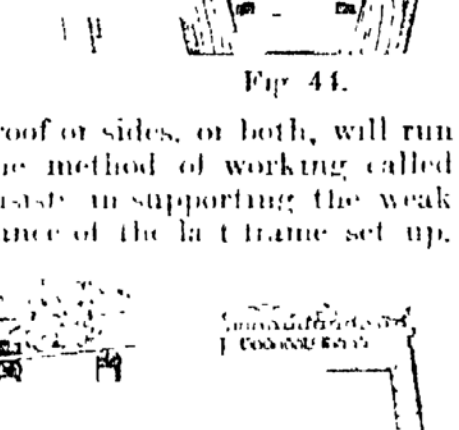

Fig. 47

pace at the sides filled with rubbish

Masonry has long been employed for supporting the sides of shafts in soft ground or where extensive. The materials necessary are stone or brick ers, or slag bricks, and the walls may be built up about 3 *walling*) or with the addition of mortar or hydraulic concrete. The bottom of a level is occasionally ed with concrete to carry off the flow of water, which otherwise might run into lower workings through cracks and crevices. ry walling is not uncommon, and it may be combined with the e of timber or iron) as shown in fig. 60 in which a level is maintained between two walls keeping back a mass of rubbish.

Figs. 48 and 49 show methods of securing a drift by arches when a lode has been removed.

The timbering required for shafts varies according to the nature of the ground and the size of the excavation. A mere lining of planks set on their edges (fig. 50) suffices for small shafts, corner pieces being nailed to keep the successive frames together. In some of the salt mines of Cheshire the shafts are lined with 4-inch planks united by mortice and tenon joints.

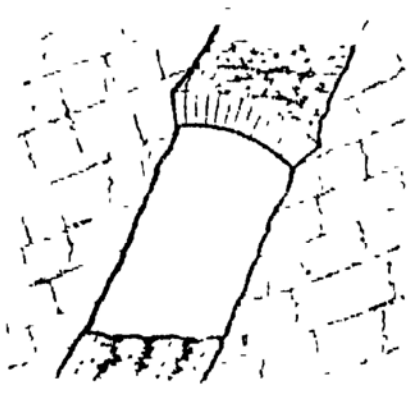

Fig. 48

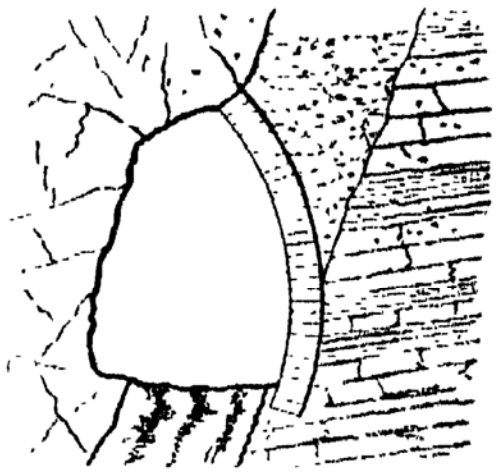

Fig. 49.

Fig. 50.

The usual method of securing shafts is by *sets* or *frames*. Each set consists of four pieces, two longer ones called *wall plates* and two shorter ones called *end-pieces*. They are joined by simply halving the timber as shown in

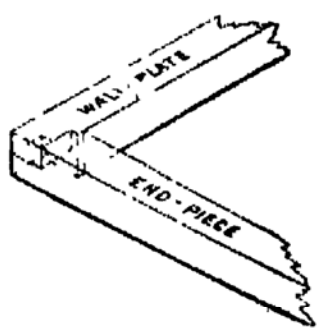

Fig. 51

Fig. 52.

fig. 51. A more complicated joint (fig. 52) is often preferred. The separate frames are kept apart by corner pieces (*studdles*, Cornwall; *jours*, Flintshire), and loose ground is prevented from falling in by boards or poles outside the frames.

As shafts are frequently used for the several purposes of pumping, hoisting, and affording means of ingress and egress by ladders, it becomes necessary in such cases to divide them into compartments. Pieces of timber parallel to the end-pieces (*buntons* or *dividings*) are bxed across the shaft, and serve to stay the wall-plates and carry the guides as well as to support planks (*casing boards*) which are nailed to them so as to form a continuous partition or boarding. The magnificent timbering of some of the shafts on the Comstock lode is described by Mr James D. Hague as follows:[1]—

"The timbering consists of framed sets or cribs of square timber, placed horizontally, 4 feet apart, and separated by uprights or posts introduced between them. Cross timbers for the partitions between the compartments form a part of every set. The whole is covered

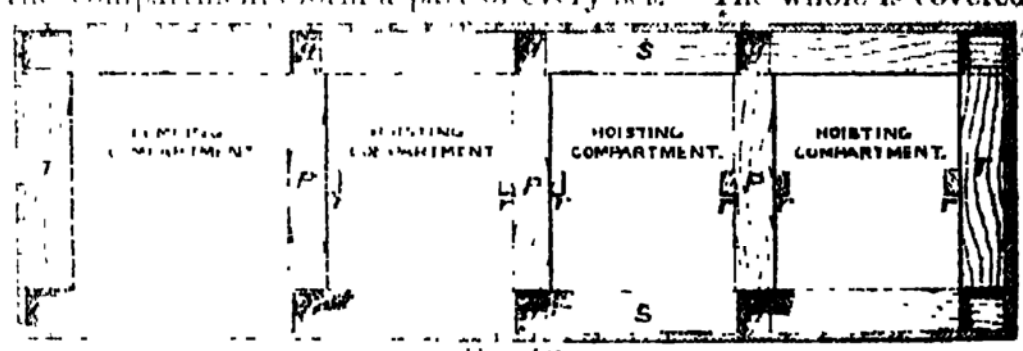

Fig. 53.

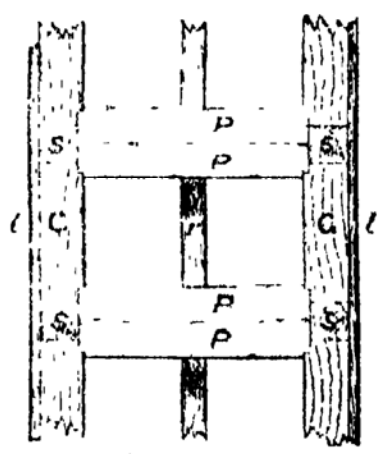

Fig. 54

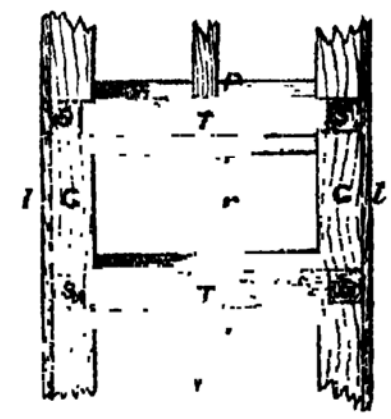

Fig. 55.

on the outside by a lagging of 3-inch plank placed vertically." Figs. 53, 54, and 55, copied from Mr Hague's plates, illustrate this method

[1] *United States Geological Exploration of the Fortieth Parallel*, vol. iii., "Mining Industry," p. 193.

of timbering. Fig. 53 is a plan of the shaft "S, S are the longitudinal or sill timbers, T, T the transverse end timbers, P partition-timbers, *r* guide rods between which the cage moves, *g* gains cut in the sill-timbers, to receive the ends of the posts. The sheathing or lagging is seen enclosing the whole frame." Fig. 54 is a transverse section through the partition P of fig. 53, "between the pumping compartment and the adjoining hoisting compartment, looking towards the latter. In this figure, G, G are the posts, S the sill-timbers, P the partition-timbers, the ends of which are framed with short tenons that are received in gains cut in the sill timbers and the ends of the posts; *r* guide-rod, *l* lagging or sheathing." Fig. 55 is an end view of the frame shown in fig. 53. "The single piece T forms the end, while the double pieces P forming the partitions are seen beyond." "The outer timbers of each set, that is, the two sides and ends of the main frame, are 11 inches square; the posts, ten in number, four at the corners and two at each end of the three partitions, are of the same size. The dividing timbers, forming the partitions, are 12 inches square."

When ground is loose or running, recourse must be had to a *spilling* process like that described for levels. Strong balks of timber are fixed at the surface or in solid ground, and then the first frame is hung from these *bearers*, and each successive frame from the one above it. Iron bars with cotters may be used for suspending the sets; but on the Comstock lode each bolt is made in two parts with a tightening screw in the middle, and the frames can thus be kept very firmly together. The laths are driven in advance, in the manner explained in the case of levels, and a new frame is put in as soon as the excavation has been sufficiently deepened within the protecting sheath of boards. In very unstable ground it may be necessary to put in the frames touching each other, so that the shaft becomes encased in a solid box of timber occasionally 14 inches thick.

Like levels, shafts may be lined with masonry or brickwork, and these have the advantage of being far more permanent than timber, and of requiring fewer repairs. This kind of shaft lining is especially desirable in the loose ground near the surface, because, if the working is discontinued temporarily, the shaft still remains secure and available for use at any future time; whereas if timber is put in it often decays, the top of the shaft collapses, and much expense is incurred in the process of reopening it. The section of the shafts that are walled is generally circular as affording the best resistance to pressure, but elliptical walling is also met with. Another shape is like a rectangle, save that the sides instead of being straight, form curves of large radius. The walling may be dry or with mortar, according to circumstances.

The masonry is put in either in one length or in successive portions in descending order, and this is the usual plan. The shaft is sunk a certain depth, with temporary timbering if necessary, and when firm ground has been reached a bed is cut out round the shaft, and on this is placed a curb or crib AB fig. 56[1] consisting of segments of timber which form a ring. This serves for a foundation for the brickwork, which is built up to the surface; the temporary timbering is removed, and the space filled up with earth or concrete. Sinking is then resumed below the curb, and for a certain distance of a smaller diameter, so as to leave a bracket, or ledge, to support the first curb. On arriving, after a certain depth of sinking, at another firm bed, a second curb CD is put in and a portion of brickwork built up. When the ledge of rock is reached, it is carefully removed in small sections and the brickwork brought up to the first curb. This process is repeated till the shaft is completed, or reaches rock in which no masonry is required. If, owing to the nature of the ground, it is impossible at first to find a firm seat for the curbs, it becomes necessary to hang them by iron bolts from a strong bearing frame at the surface.

Fig. 56.

When shafts pass through very watery strata, it is most desirable to stop all influx into the mine for the purpose of saving the heavy expense of pumping. The manner in which this is effected by a watertight lining, known as tubbing, is described in the article COAL, vol. vi. p. 62, where will also be found an account of Triger's plan of sinking shafts with compressed air, and the very successful method of boring shafts through water bearing ground invented by Messrs Kind & Chaudron.

7. Exploitation, or Working Away of Veins, Beds, and Masses.—We have described how shafts are sunk and levels driven, and we now come to the processes employed in removing the mineral.

[1] J. Callon, *Lectures on Mining*, vol. i., Atlas, plate xxvii.

The deposit must first of all be reached by a shaft where the contour of the country permits it, by a level. In the case of a vein an exploratory shaft is often sunk on the course of the lode for 20 or 30 fathoms, and if indications found in a level driven out from the shaft warrant further prosecution of the mine, a first main shaft is sunk to intersect the lode at a depth of 60 fathoms or more from the surface. Crosscuts are then driven out at intervals of 10, 15, or 20 fathoms to reach the lode, as shown in fig. 57, which represents a section at right angles to the line of strike. Sometimes the main shafts are carried down all the way along the dip of the deposit, though perpendicular shafts have the advantages of quicker and cheaper winding and cheaper pumping, to say nothing of the possibility of utilizing the cage for the descent and ascent of the miners. If an inclined shaft appears to be advisable, great care should be taken to sink it in a straight line. In either case levels are driven along the strike of the lode as shown in the longitudinal section fig. 58, in the hopes of meeting with valuable

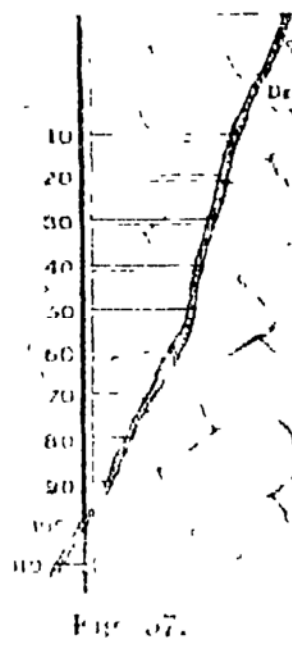

Fig. 57.

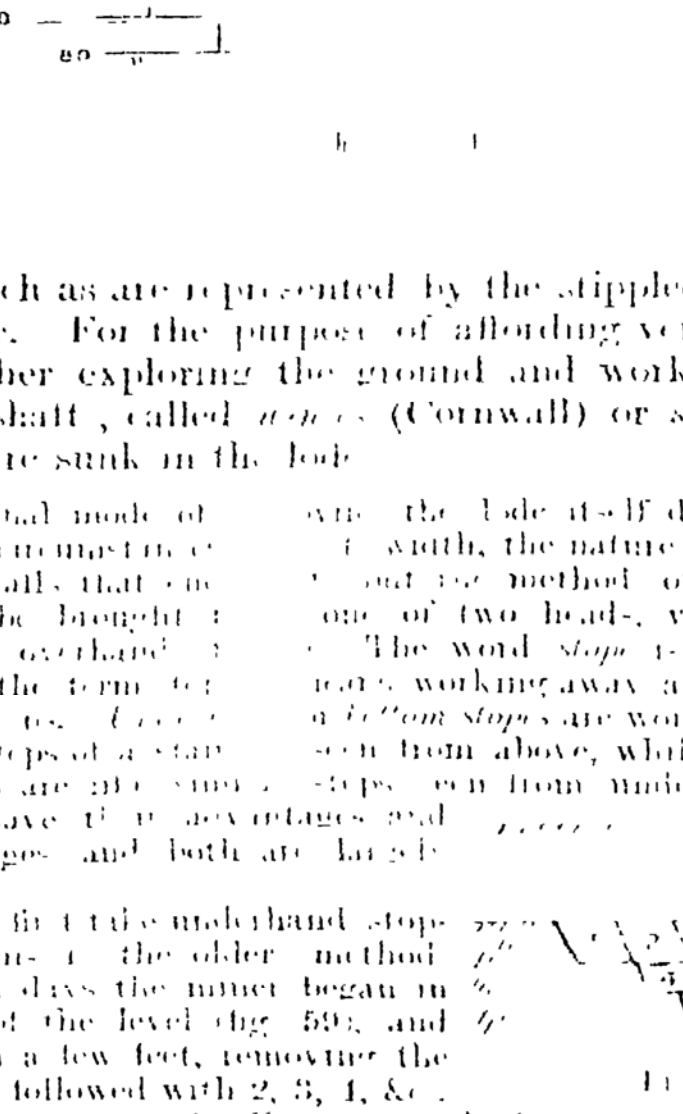

bodies such as are represented by the stippled portion of the figure. For the purpose of affording ventilation and still further exploring the ground and working it, intermediate shafts, called *winzes* (Cornwall) or *sumps* (South Wales), are sunk in the lode.

The actual mode of working the lode itself depends a good deal upon circumstances, such as the nature of the ore and the walls that can generally be brought under one of two heads, viz., the stoping or overhand system and the underhand system. The word *stope* is equivalent to working away any deposit, and *overhand stopes* are working from below, while *underhand stopes* are worked from above, whilst *back stopes* are also sometimes spoken of. Both methods have their advantages and disadvantages, and both are largely

We will first take the underhand stoping, as this is the older method. In the old days the miner began at the floor of the level (fig. 59), and sank down a few feet, removing the whole of the lode as he went. He would then proceed with 2, 3, 4, &c., until the excavation finally presented the appearance of fig. 60. Any valueless rock or mineral was deposited upon forms of timber (*stulls*), and the ore was drawn up into

mollass. One great disadvantage of the method is that the

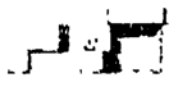

Fig. 71.

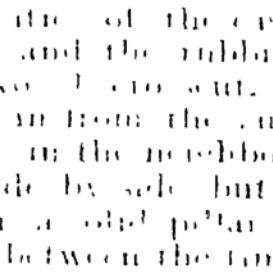

Fig. 72

timbering is composed of sets and 7). It consists of nine timbers together in certain definite sets, each of being composed of a square base placed horizontally, formed of four timbers, sills, and cross-pieces 4 to 6 feet long, framed together and mounted by four posts 6 to 8 feet high, at each corner and capped by a frame work, similar to that of the base. These cap-pieces, forming the top of any set, are at the same time the sill or base of the next set above; the posts in the one set are one above the other in the shaft, being generally placed in position directly over those below. The timbers are usually of 12 inch stuff, quite square, hewn or sawn. Each post has a tenon 9 inches long at the upper end and a tenon of 2 inches at the lower end, which latter is to mortises in the cap and sill respectively, a sill and cap have horn-tenons on each end and boulde receive the ends of the posts and the horizontal cross-pieces wall of the excavation, the latter is framed by a lagging of split or sawn planks. The whole width of the ore-body is stoped away at once, and its place supplied by waste rock, and finally the vacant space filled with waste rock derived from dead work in the mine or from special excavations under ground quarried on set purpose. In barren ground the stopes are overhand, starting from an intermediate drift or winze 7) will explain how the different frames are built up one a other.

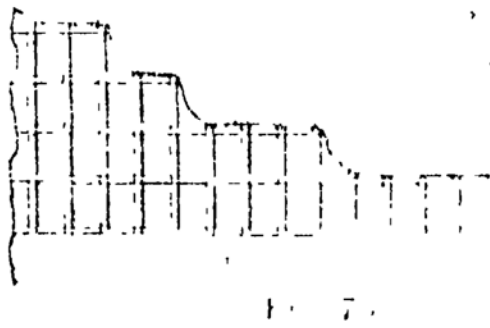

Fig. 73.

Another method of working a wide lode is to attack it

James D. Hague, *United States Geological Survey*, 1st ... the *Pacific*, vol. iii. "Mining Industry," p. 112.

parallel to the dip, working away each slice separately as if it were a lode of ordinary dimensions and filling up with rubbish (fig. 74).

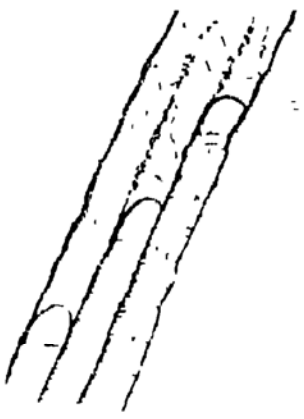

Fig. 74.

We now come to beds or seams. The mode of working the most important beds that occur in the earth's crust, viz., coal seams, has already been described in the article COAL (vol. vi. p. 61), and the details have therefore only to be given concerning the removal of the mineral by pillar working and long-wall working. Both these methods are applicable in the case of many other mineral beds. Such for instance are the beds of fireclay met by roadways which are wrought by both the methods just mentioned (see also in connexion with coal mining). Next in importance to coal in this section and a brief account of the workings in the Cleveland ore district will explain the manner in which more than one third of the iron ore raised in the British Isles is obtained by mining. It resembles the "board and pillar" system used for working coal in Durham.

The Cleveland ore occurs in the form of a bed from 6 to 16 feet thick in the Middle Lias, lying pretty level. A mainway (fig. 75) is driven about 12 feet wide for a considerable distance, and at right angles to it *boord* are driven 5 yards wide for a length of 30 yards and then at right angle a *stall* 7 or 8 feet wide and 20 yards long. By driving sets of this kind the bed is cut up into pillars or blocks 30 yards long by 20 yards wide. The pillars are subsequently removed in the following way. A *place*, or drift, 6 feet wide, is driven

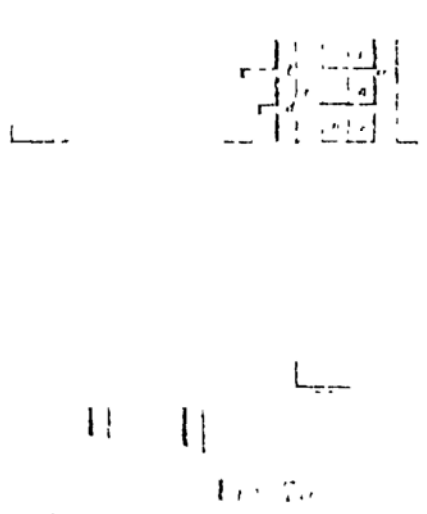

Fig. 75.

across the pillar 10 yards from the corner, and portions *slitts* about 5 yards wide are worked away in the order 1, 2, 3. After No. 1 slitt has been removed the timber put in to support the roof temporarily is withdrawn, and the roof is allowed to fall. No. 2 is then taken, and No. 3 in the same way. While these slitts are being taken out, another place *or* is being driven across the pillar 10 yards from the first, and the pillar removed entirely by a series of four slitts.

Fig. 76 represents in section and plan the chambers and pillars in the underground gypsum quarries which supply the well-known plaster of Paris to all the world.[1] The principal bed is from 50 to 60 feet in thickness; pillars are left 10 feet square at the base, and the *stalls* between them are 10 feet wide. The workings are slightly arched and are

Fig. 76.

carried up to the roof, for the purpose of better maintaining the security of the chambers, because heavy charges would have to be used if they "heaved in" and rent the entire strata. A small layer left for the floor prevents (see COAL, vol. vi. p. 64), and the underground roads to be kept in good repair.

Underground slate quarries afford examples of very various method of removing thick beds of mineral of comparatively little intrinsic value. At Angers in France, where the beds dip at a high angle, the underground workings are carried on like an open quarry

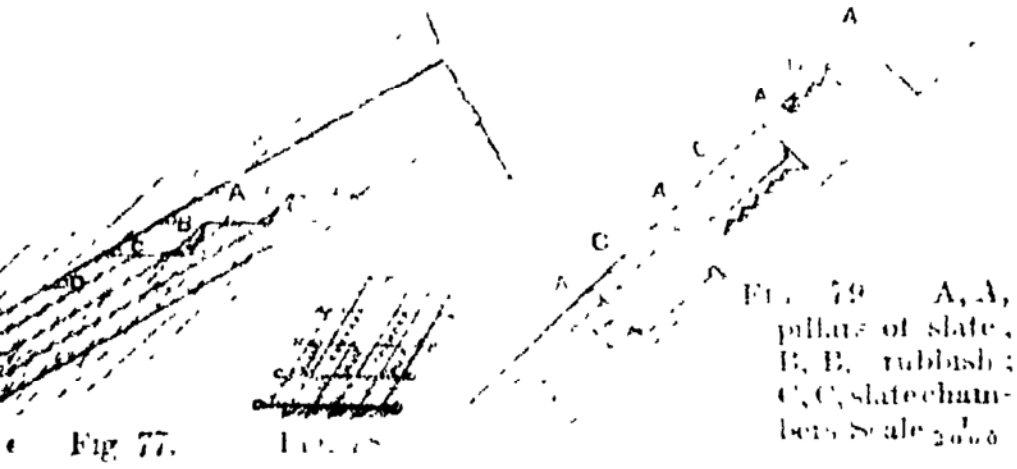

Fig. 77. Fig. 78. A, A, pillars of slate; B, B, rubbish; C, C, slate chambers. Scale 200 feet.

under a strong roof of slate, the floor is continually being worked away in steps, and an immense open chamber is left. In the Festiniog district in North Wales the principal bed, or *vein* as it is called, is more than 100 feet thick in places, and the method of working consists in making alternate pillars and chambers each 30 feet to 50 feet wide along the strike (cross-section and plan, figs. 77 and 78). The pillars follow lines of natural cross rending PP', which commonly make an angle of 25° to 35° with the direction of the dip. The excavations are arranged in regular lines, and form continuous chambers extending very often from the surface to the very lowest workings. A, B, C, D are the original working levels. The slate of the supporting pillars is entirely lost, as these cannot be removed with safety. This method of working requires a strong roof. In the Ardennes, on the contrary, the pillars are carried along indefinitely along the strike (fig. 79, cross-section). The slate in each longitudinal chamber is removed in slices parallel to the bedding, and the men stand upon the rubbish, which finally fills up the chambers completely.

Rock salt constitutes another important mineral which occurs in the form of stratified deposits. The principal source of the Cheshire salt is a bed 8 feet thick lying horizontally; but only the bottom part, 5 feet to 6 feet thick, is mined. Pillars 10 yards square are left prominent by about 25 yards apart, as shown in fig. 80, which represents part of Marston Hall rock salt mine.[2] The workings

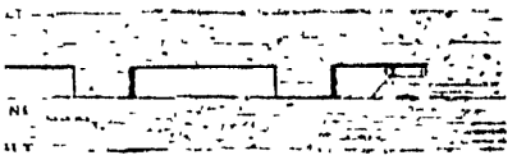

Fig. 81.

are advanced by making in the upper part an excavation 5 feet 9 inches high (called the *notong* or, fig. 81), and then the lower two-thirds of the part cut are removed by blasting slanting holes. Many of the old salt mines have collapsed from weakness of the roof or insufficiency of the pillars, and have become inundated; the brine is then extracted by pumping and evaporated for salt.

In some countries, especially when the beds of salt are impure or much mixed with clay or shale, the formation of brine is conducted regularly by making a network of drivages within a rectangular, elliptical, or circular area in thick beds of saliferous marl, and then introducing fresh water by pipes, so as to form underground ponds which gradually dissolve the roof and sides. The brine is drawn off and either pumped up or conveyed by adits to the surface.

A few words remain to be said about open workings. Some minerals are always obtained in this way; others are worked open before regular underground mining begins; and, thirdly, it often happens that underground and surface work are both carried on simultaneously on the same deposit. Among deposits worked open-cast are peat, numerous kinds of stone, iron ore, cupreous pyrites, lead ore, gold and tin-bearing alluvia, and diamantiferous rock.

Owing to its soft, spongy, and fibrous texture, and the fact of its often lying below the water level, peat has to be worked in a special manner. Trenches are dug about a foot deep with a sharp spade, and the sods cut out are of convenient size for drying and burning. When one layer has been removed in this way, another is taken off, and so on. If water is reached the working can still be pursued by using the long spade *cayond louchet*, France) with a handle of 16 or 20 feet. It cuts out a sod 3 or 4 feet long at each thrust.

When a deposit is more or less solid the workings are frequently arranged in steps, the height and breadth of each depending upon the firmness of the rock.

In many cases the first work consists in removing worthless rock at the surface (*découverte*), and where the underlying deposit is thick or very valuable it will pay to remove a very great thickness of overburden, on account of the advantages of working a deposit open. The chief advantages are entire removal of the deposit without loss in pillars, no expense for timbering or for packing with rubbish or for ventilating or lighting the workings, better ventilation, easier supervision, longer working hours, less danger.

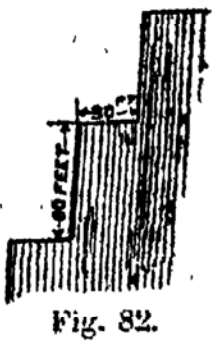

Fig. 82.

As an example of a large open working may be mentioned the great Penrhyn slate quarry near Bangor, employing about 3000 hands, and worked by a succession of terraces on an average 60 feet high by 30 feet wide (fig. 82). Reference has already been made to the thick lead-bearing sandstone of Mechernich, which is in part worked as an open quarry. Mokta-el-Hadid, near Bona in Algeria, and the Rio Tinto mines in Spain, afford instances of extensive combined open and underground workings for iron ore and cupriferous pyrites respectively.

Local laws regulating the size of the working areas, or claims,

[1] Callon, *Lectures on Mining*, vol. ii. plate xii.

[2] Joseph Dickinson, "Report on the Salt Districts," *Reports of the Inspectors of Mines for the year* 1881, p. 66.

owned by separate individuals or companies, considerably affect the methods of working. This is especially the case with the diamond deposits of South Africa. The diamantiferous rock at the celebrated Kimberley mine (formerly called Colesberg Kopje) occurs in the shape of an elliptical upright mass, the greatest length being about 330 yards and the greatest breadth about 200 yards. The superficial area is about 9 acres; the mass extends downwards within almost perpendicular walls of shale, and is worked in places to a depth of about 400 feet. The claims are only 31 feet square, and are more than four hundred in number, and these have in some instances been subdivided into portions as small as the sixteenth of a claim, but, as at the present time one company may own very many claims, the number of individual holdings is less numerous than formerly when the limit was two claims. The working is carried on vertically downwards, and, as the claims are not all worked at the same rate, those that progress most rapidly are surrounded by perpendicular walls of neighbouring claims. The shale, or *reef*, enclosing the deposit is constantly falling into the huge open pit, and has to be cut away to a slope, the expense of this work being borne by the claim holders generally by the mining board. The diamantiferous rock is extracted by numerous rails with rope traction.

We have already referred to the method of working gold-bearing alluvia by the hydraulic process, which has rendered notorious in the United States (GOLD, vol. x. p. 716). At the same time we must not be blind to the evils of this method of working, which at last necessitated legislative interference. Some idea of the extent of the mischievous results of hydraulic mining will be gathered from the statement that one working alone, the Gold Run Ditch and Mining Company, for the last eight years has been discharging 4000 to 5000 cubic yards of sand, gravel, and boulders daily, for a period of five months each year, into a tributary of the Sacramento. As a natural consequence deposits are formed lower down the river, obstructing the navigable channels, rendering overflows more frequent and destructive, and causing valuable land to be destroyed by deposits of sand. The superior court of Sacramento county, California, has recently decided that the hydraulic mining companies must build dams to impound the coarse and heavy debris, or take other efficacious means to prevent them being washed down the rivers.

8. *Carriage or Transport of Minerals along the Underground Roads.*—After the mineral has been broken down in a deposit it is necessary to pick out any barren rock and then convey to the surface all that is of value.

The simplest and oldest method of transport along underground roads is carriage on the back, and this method may still be seen at the present day even in countries where the art of mining is generally highly advanced. Thus, for instance, in the little slate mines near Cochem on the Moselle men and lads carry up all the blocks of slate upon their backs, walking upon steps cut in the rock; they come up with their hands upon the ground bent almost double under the weight of the block, which rests upon a thick pad. Again, the blocks of slate are still carried on the back from the actual working place to the nearest tram-road, in the slate mines of the Ardennes. In the Sicilian sulphur mines the same method is common, and it is found also in parts of Spain and China, where baskets are used, whilst bags are employed in Mexico and also in Japan. Even in England the system still survives in the Forest of Dean, where boys carry iron ore in wooden trays from the very irregular ore-producing cavities either to the surface or to the nearest shaft.

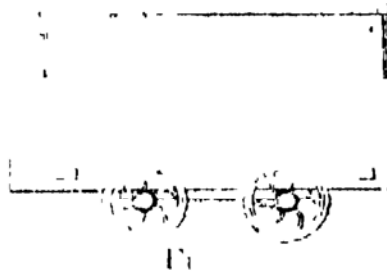
Sledges, or *sleds*, enable greater loads to be transported: but they are not available unless the conveyance is along roads sloping downwards. They have been largely employed in coal mines, and are still resorted to in some collieries for conveying the coal from the working place to the nearest tram-road.

We next come to wheeled carriages. The simplest is the wheelbarrow. The barrow used in Cornwall at the present day is not unlike that figured more than three centuries ago by Agricola. The navvy's barrow is more advantageous, but it requires a wider and higher level. The barrow runs upon the natural floor of the level, upon boards, or upon thin strips of iron. Carts drawn by horses may be used in large underground quarries. Excepting in special cases it is advisable to replace barrows by waggons running upon rails. The oldest form is the German *Hund*. It consists of a rectangular wooden body, with four wheels resting upon two boards as rails, and it is kept on the track by a pin which runs between the boards.

Cast-iron tram plates were introduced in the last century and were finally succeeded by iron rails, which are now in general use, though steel threatens to displace iron in this as in other departments of mining. Various forms of rail are employed. The simplest is a bar of iron set on its edge in transverse sleepers, or flat iron nailed to longitudinal sleepers. Small T-headed and bridge rails are not uncommon. In the Harz the rails sometimes lie on stone sleepers; a hole is bored in the stone, plugged with wood, and the rails nailed on. The gauge varies from 14 inches to 3 feet or more, 20 inches to 22 inches is a common gauge in metal mines. Arrangements of course have to be made for passing from one line to another by *points*, but the transference is frequently best effected by putting down flat plates of cast iron, upon the smooth surface of which the waggons can be handled with ease and turned in any direction, raised ledges guide the wheels into any particular track.

The form and size of the waggons running upon the rails necessarily vary according to the size of the underground roads and the manner in which the mineral is raised in the shaft. In some mines the practice exists of loading the mineral in the level into an iron bucket (*kibble*) standing upon a *trolley*, which is merely a small platform upon wheels. This trolley is pushed (*trammed*) to the shaft, the full kibble is hooked on to the winding rope and drawn up, whilst an empty kibble is placed upon the trolley and trammed back along the level, where it is again loaded from a shoot (*mill, pass*) or by the shovel. The usual plan, however, is to have a waggon, which is tipped on coming to an enlargement of the shaft (*plat, lodge*) where the level joins it. These waggons may be made of wood or sheet iron, and of late years sheet steel for the body and cast steel for the wheels have been coming into favour.

The most modern system in metal mines is to imitate collieries, and use waggons which are drawn up in cages. Fig. 83 represents the plain but strong waggon of the Vivian mines, consisting of a rectangular body of sheet iron resting on an oak frame, and provided with cast steel wheels. The wheels are loose upon the axles, which themselves run loose in the pedestals. The waggon is emptied by being run on to a "tippler," which enables it to be completely overturned with great ease. A common plan is to construct the waggon with a hinged door at one end, and the contents are discharged by opening the door and raising the bo



Fig

The motive power for tramming waggons along the levels in metal mines is generally supplied by men or boys, though, where large quantities have to be extracted, and where the roads are favourable recourse may be had to ponies and horses, and the various kinds of mechanical haulage described in COAL, vol. VI. p. 69.

Trains of cars are sometimes drawn along underground railways by locomotives; they have the great disadvantage of polluting the air with the products of combustion, and consequently they are not available unless the ventilation is very good. A small locomotive of 2 horse-power nominal is used on an 18½ inch track in the adit level of the Great Laxey Mine, Isle of Man, now approaching a mile in length, and full-sized locomotives ply along the adit of the Rio Tinto mines. Locomotives worked by compressed air improve the ventilation instead of vitiating it, and are not a source of danger in cases where fire-damp may be present; but, except in special cases, they cannot be worked so cheaply as engines fired with coal. Conveyance by electric railroads underground has hardly gone beyond the experimental stage, but the results obtained at the Zauke colliery in Saxony[1] show that electricity can be applied with profit in this department of mining.

A few instances of transport by boats may still be met with. The boats used in the underground canal at Klau-thal are 31

[1] *Jahrbuch für das Berg- und Hüttenwesen im Königreiche Sachsen auf das Jahr* 1883, p. 50.

long by 4 feet 6 inches wide, and 2 feet 11 inches deep. Each boat carries 5 or 6 tons.

Where roads have a strong gradient inclined planes are employed, either self-acting if the mineral has to be lowered, or worked by stationary engines if the mineral has to be raised (see COAL, vol. vi. p. 60).

9. *Winding, or Raising in the Shafts, with the Machinery and Apparatus required.* In speaking of the transport by underground roads we mentioned that the mineral is occasionally brought to the surface on the backs of men or boys. In other cases daylight is reached by adit levels provided with railroads; but in by far the greater number of mines it is necessary to hoist the mineral, and often much rubbish, up vertical or inclined pits generally known as shafts.

In beginning to sink a shaft from the surface, or in sinking a winze, hand power applied by a windlass is sufficient. The broken rock at the bottom of the shaft is shovelled into a wooden or iron bucket (*kibble*), which is drawn up by a rope passing round the barrel of the windlass. When a depth of 20 or 30 yards has been reached it is more advantageous to introduce horse power, and the usual machine by which this power is applied, called a *gin* or *horse whim*, is a common sight in many metalliferous districts. It consists of a vertical axis carrying a barrel or drum 8 to 12 feet in diameter, round which is coiled the rope, which after passing over a pulley hangs down the shaft. The axis carries an iron pin at each end, the lower one working in a stone and the upper one in a socket in the cross-beam or cross-bar of the supporting frame. Under the barrel is a long driving beam to which a horse is harnessed and as will be readily understood, the kibble is drawn up or lowered down as the horse walks round. It is most economical to have two kibbles, for then they balance each other.

Where steam and water power are not available, a large number of horses or mules are sometimes harnessed to whims and ore raised from depths of 900 fathoms. These, however, are exceptional cases; and, generally since the introduction of portable engines, the use of steam power even for comparatively small depths such as 100 yards, is daily increasing. In hilly districts water power is generally at hand, and huge reservoirs are frequently constructed for storing the rainfall and so affording an adequate and constant supply. It may be utilized by water wheels, turbines, and water pressure engines.

There are three systems of winding by steam or water power which are in regular use: (1) by buckets (*kibbles*), bucket, or bag-swinging boxes in the shaft; (2) by boxes working between guides (*skips*, Cornwall); (3) by cages carrying one or more waggons.

buckets are made of wood, sheet iron, or [illegible]. They [illegible] vary, or may be round or elliptical, [illegible] in the cycle [illegible] ton in the middle. [illegible] rope or [illegible] a [illegible] of cast iron. When the shaft [illegible] upon which the kibble slides [illegible] lined with wood, or strengthened [illegible] vertical iron bars. Plank of hard wood like [illegible] and separate layers that [illegible] to the kibble, poles [illegible] otherwise [illegible] the [illegible] of bearers which are sometimes [illegible] Great Britain. Even where [illegible] the permanent [illegible] nature of [illegible] be wanting [illegible] most suitable, [illegible] monthly [illegible] more modern [illegible] for the kibble, which [illegible] about. Another [illegible] the kibble and used for the [illegible] ascent and descent of the men. Mr Galloway has patented a method of sinking shafts with two kibbles, the upper ends of which are coiled upon drums in the same way. By adopting this expedient the guides can be left attached to the shaft as long as required.

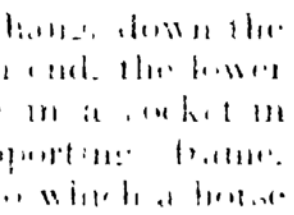


Fig. 84.

A word must be said about the actual hoisting and emptying of the kibble. Sometimes, as already mentioned, the kibble is filled at the working place or from a shoot (*pass*, Cornwall), carried down into the level, and then conveyed on a trolley to the shaft, where it is hooked on to the rope and drawn up. More frequently the filler standing in the *plat* load the kibble with a shovel; and in order to save time two kibbles are often provided, one being filled while the other is making the journey to and from the surface. In this case it is necessary to have some kind of *elevis*, which will enable the kibble to be readily detached from the winding rope, and quickly and securely fastened on again. On its arriving at the surface the *land keeper* attaches an eye or ring at the bottom of the kibble to a pair of tongs suspended by a chain, and the rope is now lowered. The kibble is then turned over and the contents fall into a tram-waggon.

The inconveniences of this method of winding are considerable, especially in inclined shafts, where the direction and amount of the inclination are not constant. There is great wear and tear on the bed plates and curving boards; and, unless constant attention is paid to repairs, places are worn out where the kibble catches, causing the rope to break. The fall of a kibble and its contents not only does much damage to the shaft, but also is a source of danger to the men. The introduction of boxes (*skips*) working between guides or conductors was therefore a decided step in advance, for these allow the winding to be carried on with less obstruction and with greater rapidity and safety. The guides are often made of pieces of timber (like *z*, fig. 53) bolted to the side pieces and dividers. They can only be employed in perpendicular shafts that are lined; made of wire rope or iron rods can be applied. The skip is a box of rectangular section, made of sheet iron or sheet-steel, with a sloping bottom and provided with a hinged door closed by a bolt or hasp on discharging its contents. Fig. 85[1] shows how the skip runs up

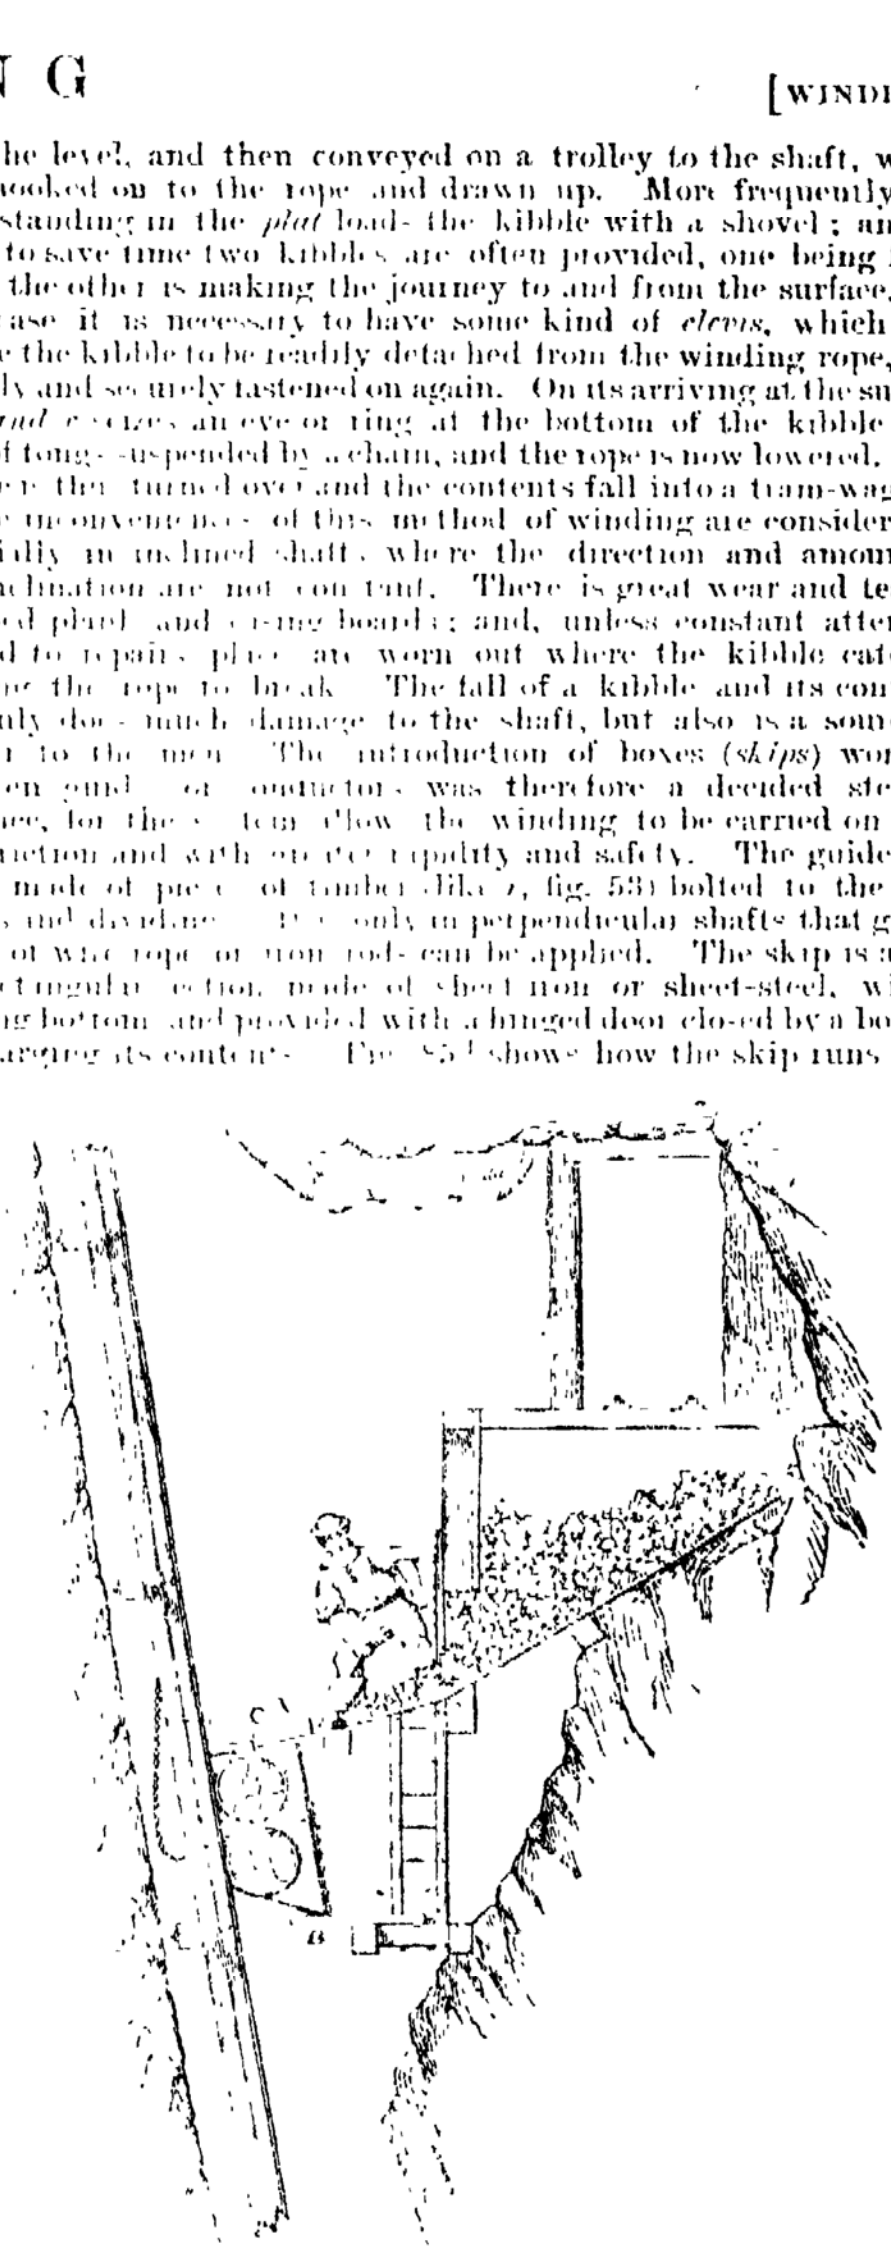

Fig. 85.

[illegible] guides [illegible] of cast iron or chetter) cast-steel wh[illegible] [illegible] the guides sometimes have iron rails lai[illegible] [illegible] with the wear. Some of the skips in Corn[illegible] [illegible] much as a ton and a half of tin-bearing [illegible] [illegible] filled by a hovel by a man standing in the plat[illegible] [illegible] arranged shoots leading from large hopper[illegible] [illegible] are made to run in without any shovelling. [illegible] time, tilted completely over instead of being emp[illegible] [illegible] door; this arrangement is in use in some of the Ge[illegible] [illegible] the skip is made of wood, and is guided on each [illegible] [illegible] of rollers running between two conductors. W[illegible] [illegible] up has reached the surface two catches are made to sup[illegible] [illegible] rollers, while the upper ones pass through opening[illegible] [illegible] guides, and the skip, turning upon the lower one[illegible] tipp[illegible] and so emptied.

The most satisfactory system of winding is by cages; the [illegible] handling of the mineral, and the hoisting proceeds at far gr[illegible] speed. This system, which is almost universal in collieries, [illegible] employed also for working deposits of other minerals, and, the[illegible]

[1] Monniot, *Annales des Mines*, ser. 6, vol. ii., 1862, plate v

n vein-mining the skip and kibble still prevail in England, the managers are beginning to recognize the advantages of the cage and quip their mines with more modern appliances than have hitherto been customary. The cages used in the mines on the Comstock ode are very light and simple in construction, as will be seen from ig. 86. The cage in fact is a mere timber platform, 5 feet by 4,

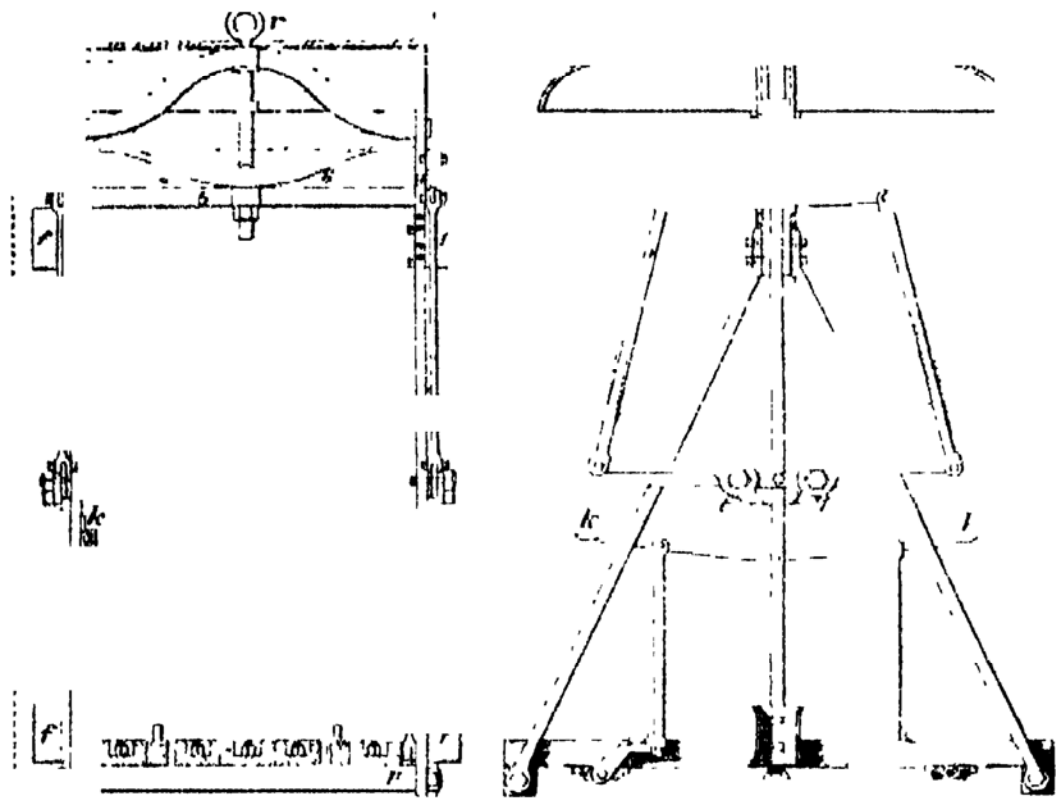

Fig. 86.—Cage used in Comstock Lode.

esting on iron bars *p*, and supported by iron rods on each side it is provided with a sheet iron hood to protect the men if they are nside, and also with safety catches *k*, *l*, which come into play if the ope breaks. The hand levers *k*, *k* at the ends of the cage raise up blocks which keep the car in its place during the ascent or descent *g*, *g* are guides for the end of the cross-bar *b*; *c*, bar working teeth *t*, *t* by levers; *f* "ear" or "shoe" embracing the guide-rod in haft; *r*, lifting bar; *s*, strong spring.

The most important details concerning the use of cages, ropes and other hoisting appliances, such as pulleys, pulley frames detaching hooks, and winding engines, have already been set forth n the article COAL, vol. vi. p. 74; and it is therefore needless o repeat these particulars, especially as the art of winding minera heaply, speedily, and safely has been carried to a far greater pitch of perfection in collieries than in the majority of metal mines. It s often convenient to fix winding engines underground for the purpose of sinking shafts and winzes, and drive them by com pressed air brought down in pipes from the surface.

The Koepe system of winding, which appears to be viewed with favour on the Continent, consists in having what is practically an endless rope with one large sheave over the shaft in the place of the two drums. There are two cages, and the rope below them acts as a counterbalance, so that the load is uniform throughout. The most novel hoisting apparatus is that of M. Blanchet (COAL, vol. vi. p. 76), which has now been regularly at work in the Hot tinguer shaft at Épinac in France for the last six years. M. Blanchet's method consists in fixing, in the shaft a large pipe in which is arranged a piston; from this is suspended a cage carrying waggons. By exhausting the air above the piston the load is gradually forced up by the atmospheric pressure below it. The Hottinguer shaft is 660 yards deep, and the pipe is 6 feet 5 inches in diameter, made up of a succession of cylinders of sheet iron about $\frac{1}{16}$ inch thick and 4 feet 4 inches high, joined by flanges and bolts. The 485 rings composing the long pipe weigh altogether 418 statute tons. The cage has nine decks, and arrangements are made for unloading three at a time; each waggon holds half a ton, so that the total useful load is 4½ tons. The speed of hoisting is 20 feet per second. If two hoisting pipes are connected the dead weights may be made to balance each other, and the power required is simply that which is necessary to overcome the weight of the useful load. All the men prefer the pneumatic hoist to the ordinary cage for descending and ascending the mine, and are regularly lowered and raised by it. The advantages claimed by M. Blanchet for this system are—(1) the possibility of hoisting from depths at which rope-winding would no longer be practicable; (2) getting rid of the costly ropes and dangers connected with rope winding; (3) better utilization of the engine power; (4) improvement of the ventilation and diminution of the amount of fire damp.

10. *Drainage.*—The mineral having been raised to the surface, the task of the miner might appear to be at an end; but this is not the case, for it is further necessary that he should keep his mine free from water and fresh air. These two indispensable operations of draining and ventilating frequently require special appliances which add considerably to the general cost of mining.

In all cases where it is possible, endeavours should be made to keep the water out of a mine, so as to save the expense of pumping it; and the method of putting in watertight lining (*tubbing*) in a shaft has been already described (COAL, vol. vi. p. 62). When large streams of water happen to be intersected by underground workings, and threaten to overpower the available pumping machinery, or when it is advisable to save the expense of draining abandoned workings, the entry of this water into the mine may often be prevented by stoppings called *dams* constructed of timber or brickwork.

In spite of all precautions, the miner generally has to contend with water which percolates into the workings. Four methods of getting rid of the water are available, viz., adits, siphons, winding machinery, and pumps.

An adit, day level, or sough is a nearly horizontal tunnel with one end opening at the surface, allowing the water to drain away naturally. In hilly countries mines are often worked entirely by adits, and even when a mine is deepened below the drainage level the utility of the adit is not thereby destroyed. It lessens the quantity of water which tends to percolate into the lower workings; it lessens the depth to which the water has to be pumped; and, by furnishing a certain amount of fall, it enables water to be applied as power. On account of these important advantages some very long and costly adits have been driven for the purpose of aiding the miners in certain metalliferous districts.

Thus in the Harz the Ernest Auguste adit ("Ernest August Stollen") has been driven a distance of nearly 6½ miles into the hills of that district. The total length of the adit, including the branches, is no less than 14 miles. It intersects many of the lodes at a depth of upwards of 600 yards from the surface. The total cost of the adit is estimated at £250,000.

Another long adit is the celebrated "Rothschönberger Stollen," which unwaters some of the most important mines at Freiberg in Saxony. The length of the main or trunk adit is more than 5½ miles, the gradient of the greater part of it being only 1 in 1000 yards. The branches of this adit among the mines are more than 16 miles in length, so that the total length of the main adit with its branches amounts to nearly 22 miles. Many of the mines are drained naturally to a depth of 200 to 300 yards. The cost of the main tunnel was £350,344, or nearly £4 per yard, but this included the cost of several shafts, heavy expenses due to pumping from these shafts, the walling of the adit for much of its length, and all connected with it. The length of time occupied in driving this adit was thirty-three years. The Kaiser Josef II. Erbstollen in Hungary is another remarkable mining tunnel which was commenced in 1782 and completed in 1878 at a total cost of £200,000 sterling. It is 10½ miles in length, extending from the valley of the river Gran to the town of Schemnitz, where it intersects the lodes at depths varying from 300 to 600 yards vertically to the elevation of the surface.

In Cornwall the Great County adit was driven for the purpose of relieving the Gwennap mine of their waters, and it was pushed nearly to Redruth. The only danger from the great work undertaken in connection by the men that if communication in the mine did not, and, that is the case, the drivages amounted to more than 50 miles, the water from the most distant mine does not rise more than about 6 inches before reaching the adit. The average depth is only 20 fathoms from the surface. In fact the great adit, the construction of great utility when the Gwennap district was in full work, is comparatively useless, drawing the lodes themselves at one mine and receiving the waters of a certain number from other mines to be conveyed to the great Scheuren, Poldice, Killivallan, and Tuscan adits, which have not been mentioned. Bigsweir Level in Northumberland is another adit which has been driven a distance of about 4½ miles, and it will have to be extended about 3 miles further before reaching Allenheads. Its depth from the surface at the place will be about 100 yards.

The main part of the Hallvan tunnel in Dumfriesshire is 2 miles 1256 yards in length, and the branch driven out to Rhodes mine intersected the vein at a distance of 809 yards, making a total of about 3½ miles. The greatest depth from the surface is 230 yards and the average depth in Hallvan Mountain about

5 yards. The length and depth of this adit are not remarkable; it the great quantity of water discharged at a point of considerable terest and importance. It is estimated that the adit now or 66,000 tons of water in twenty-our hours. The outflow is purely natural, but no mines re pumping we It is now easy to understand that he Rhos-mor though provided with powerful pumping achinery, to cope with the power encountered In the Comstock adit of which is the great Comstock lode 1,200 feet. The total cost of the tunnel, ing nine years, is estimated to have been The quantity of water running out daily in 1879 was 2 tons, at a temperature of 12 Fahr. at the mouth of the The water must otherwise have been pumped to the surface at a cost estimated at $3000 a day. The obstacles to ress were very great not only was the heat extreme, but water-ground was encountered which stopped the strongest timber. Thanks, however, to the untiring energy of Mr Adolph utro the difficulties were at last once fully overcome, and this great work will long remain a monument to his foresight, skill, nd great pertinacity.

The Atlantic Pacific tunnel, which was commenced in 1880, will ross the heart of the Rocky Mountains under Gray's Peak, olorado. It is being driven from both sides of the watershed, and ill have a total length of 6 miles from end to end.

Siphons have been used for unwatering workings in pecial cases, but of course they will not act unless the arrier over which the water is raised is very decidedly less han 33 feet.

When workings cannot be drained by tunnels or siphons it necessary to raise the water mechanically either to he surface or at all events to an adit through which it an flow away naturally. If the amount of water is not so considerable, it is often convenient to use the winding machinery and draw up the water in special buckets (*water ords*) or tanks. The bucket may be tilted over on reaching the surface, or it may be emptied by a valve at the ottom. This means of raising water is often adopted while sinking shafts, when it may be desirable to wait till he whole or a portion of the shaft is completed before utting in the final pumping machinery.

The varieties of pumps used in mines are numerous. In mall sinkings hand pumps, either direct acting or rotary, may be applied, steam jet pumps on the principle of the Giffard injectors are also used, and pulsometers, though equiring a large expenditure of steam, have the advantages f being quickly fixed, of occupying little space, and of orking with sandy or muddy water. They are capable, herefore, of rendering great service in special cases. When we come to the definitive machinery erected in arge mines of considerable depth, we find that the pre ailing types of pumps are few. They may be classified as follows: (A) lifting and force pumps worked by rods in the shaft actuated by wind, water, or steam power; (B) orce pumps at the bottom of the shaft worked by steam, ompressed air, or hydraulic pressure.

A. In connection with the first method we have to consider the motive power, the rods, and the actual pumps themselves.

Windmills have the great advantage, which is often fatal, that the power is not constant. By erecting an auxiliary steam-engine which can be set to work if wind fails, this evil is overcome, and at the Moor mine, Scilly, a windmill pumps its water from a depth of 32 fathoms at the rate of upwards of 90 gallons per minute. As the mine is breezy, there is wind enough to work the mill about half the time.

Water power was for long the principal agent employed in draining mines, and is still of the greatest utility in many districts. Reservoirs have been constructed to collect and store the rainfall. Some idea of the extent upon which these works are conducted will be gathered from the following figures relating to the Harz mines. In 1865 there were fifty-seven reservoirs covering an area of 642 acres, and having a storage capacity of 336,000,000 cubic feet. The total fall of the various leats,

races, and other water-courses, including the six principal adits, is about 170 statute miles. The net power extracted is reckoned at 1870 horse-power, but less than one-fourth of this is used for pumping.

Water-power is applied to pumping machinery by water-wheels, turbines, and rotary or non-rotary water pressure engines. Except ing the case of the latter, the rotary motion has to be converted into reciprocating motion by a crank; and furthermore with turbines the speed must be reduced very considerably by intermediate gearing.

Overshot wheels are the commonest prime movers when pumps are worked by water power, water-wheels are frequently constructed 40 or 50 feet in diameter, and at the Great Laxey mine, in the Isle of Man, one of the wheels is no less than 72 feet 6 inches in diameter and 6 feet in the breast. The power is conveyed from the water wheel by a connecting rod to a bell crank (*bob*) placed over the shaft and when, owing to the contour of the ground, the wheel has to be placed at a distance, it is connected to the bob by the so called *flat rods*, made of wood, bars of iron, or wire rope, travelling backward and forwards, and supported by pulleys or oscillating upright beams.

Water-pressure engines have the advantage of being able at once to utilize any amount of fall, and those which are direct-acting can be applied immediately to the main rod of the pumps.

Steam, however, is the power used *par excellence* in draining mines; indeed the first applications of steam-power were made for this purpose, and Watt's great inventions owed their birth to the necessities of mines which could no longer be drained by the water power at their command.

The principal type of engine is that known as the Cornish engine which is a single acting condensing beam engine working expansively. Its mode of action may be briefly described as follows. The steam is let in at the top of the cylinder and presses down the piston, which is connected with one end of a large beam, while the main rod of the pumps is attached to the other. When the piston has completed its course the equilibrium valve is opened by a cataract, and, the pressure on both sides of the piston being now equal, the weight of the pump rods, or rather the excess of their weight over that of the counterbalances, causes them to drop and force up the water from the mine by means of the plungers which will be described immediately. Double-acting rotative engines working the pumps by cranks may also be met with.

The rod in the shaft, known as the *main rod* or *spear rod*, is usually made of strong balks of timber butted together and connected by *strapping plates* fastened by bolts. It serves to work either lifting pumps or force pumps, or both.

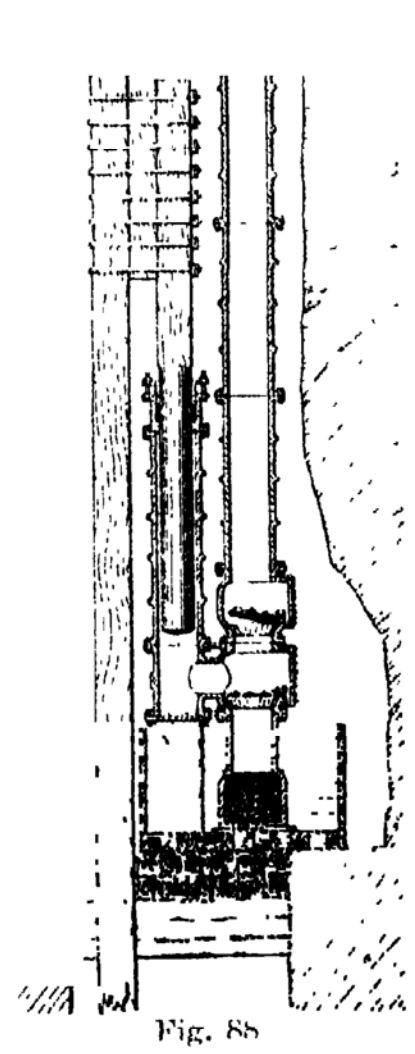

Fig. 88

The lifting pump, or drawing lift (fig. 87),[3] consists of the wind bore, the clack-piece, the clack-seat piece, the working barrel

[1] *Mining and Scientific Press*, San Francisco, 1882, vol. xlv. p. 241.

[2] "Notes on the new Deep Adit in the Upper Harz Mines," by H. Bauerman, *Report of the Miners' Association of Cornwall and Devonshire*, 1868, p. 21.

[3] Michell and Letcher on "Cornish Mine Drainage," *Forty-Third Annual Report of the Royal Cornwall Polytechnic Society*, p. 211.

mounted by pumps, and the bucket with its rod. The whole orks like any ordinary pump, and needs no special explanation.

The force-pump used in mines, known as the plunger-pump, onsists of a solid piston (*plunger*) (fig. 88)[1] working through a tuffing-box in a pump standing on the H-piece. This has a valve hich communicates with the *windbore* resting in the cistern elow the H-piece comes the *door-piece* with another valve, and hen a series of pipes, generally of cast iron, but occasionally of rought iron, constituting the column. The upward motion of he plunger, which is attached to the main rod, causes an inflow of ater, which is forced into the column when the plunger descends. t is usual to fix a drawing lift at the bottom of the shaft, which aises the water into a first cistern, and thence a plunger forces it nto a second cistern some 60 yards higher up, and it is continually oreed up from cistern to cistern until it reaches the adit or the urface.

There are numerous important matters which require special ttention, such as the valves, catches, balance-bobs, guiding rrangements for the rod in inclined shafts, the V-bobs, foul-oil obs, and running loops, which have to be used when there are ends in the shaft; but space will not permit of more than mere nention of these details.

Such then is the standard arrangement worked by steam or vater power for pumping from mines. The great advantage of the ystem consists in the employment of the plunger, because it is imply necessary for the machine to raise a weight slightly greater han that of the water, which is forced up afterwards by the down stroke of the rods. Leaks are readily discovered, and the stuffing-box can be easily screwed up as the packing wears, this is one great reason of the superiority of the plunger compared with a piston working in a barrel.

The modifications of this system relate more to the engines employed than to the actual pumps themselves.

The cylinder of the Cornish engine is sometimes reversed and stands over the shaft, the main rod being attached directly to the piston. This type of engine, known as the Bull engine in Cornwall, dispenses with the ponderous beam, but it has the great disadvantage of obstructing the mouth of the shaft. The use of two cylinders combined, as invented by Woolf, causes less strain upon the main rod and pumps (*put work*) and machinery generally, as the initial velocity of the piston is smaller and the engine starts with less jerk. The cylinders are placed side by side or one above the other.

Kley, of Bonn, has constructed engines on the Woolf system with steam acting on both sides of the piston. He makes the excess of the weight of the rod over that of the counterbalance sufficient to raise only half the weight of the water and to overcome the friction; and then in the descending stroke the steam acts on the top of the piston and so makes up for the insufficiency in force of the rods. As the steam acts on both sides of the piston the same amount is consumed, it is true, but a smaller cylinder will do the work, and the original cost of the engine is lessened. The same engineer of late years has put up several pumping engines in Belgium, Germany, and France of 30 to 560 horse power, with a fly wheel which serves simply to regulate the stroke of the piston, so that the crank always stops before or after the dead point till the cataract starts another stroke. The engines are double-acting, with two cylinders and beam. The advantage of working with the fly wheel is that the main rod and pumps are set in motion without the injurious jerk unavoidable with a Cornish engine worked at a high rate of expansion.

M. Guinotte, the well known Belgian engineer, also adopts a fly-wheel, and the engines he has erected at Marcinelle and elsewhere are single-acting rotary engines with one cylinder. The peculiarity of the fly-wheel is that he can weight it in any way he pleases; and he so overcomes the difficulty, which occurs in other rotary machines, of its being impossible to work them below a certain speed. His object has been to make the speed slow at the beginning and end of a stroke, so as to avoid the injurious shocks to the valves and machinery generally from sudden starts and stoppages. In order to make the main rod act by traction only and not compression, which may be advisable with iron rods, the plungers are sometimes reversed; whilst Kraft of Seraing has introduced the Rittinger pump, which consists of a hollow moving plunger with a valve inside, and a plunger case above it working over a hollow fixed plunger. By this arrangement both the up and the down stroke of the engine cause water to be forced up; and this pump is used with a double-acting rotary engine.

B. We must now speak of the second class of pumps, viz., force pumps worked by steam, water power, or compressed air at the bottom of the shaft.

The steam pumps are of very various descriptions,[2] but they mostly consist of one or two plungers, or rams, set in motion by a rotary or a non-rotary engine, which may or may not work with expansion and condensation. The plunger or ram is generally fixed directly on to the piston, and works in the same line, consequently the power is transmitted to the plunger with the least possible loss. The water is forced up the shaft in one long column. Engines and pumps of this kind are easily kept in order, all the parts are readily accessible. The miner is able to dispense with the heavy beam, the massive engine house, the long main rod and its connexions, and bobs, the various cisterns and plungers, and instead he has a compact and easily supervised machine and a simple line of pipes taking up but little space in the shaft; the pump can therefore be erected and set to work very quickly, and this is a matter of the utmost importance in emergencies. It is true that these direct acting steam pumps, even when worked by a compound engine, cause a greater consumption of coal than the Cornish engine; but, on the other hand, there is the economy in first cost, erection, and repairs which has led to their adoption more especially in collieries. The steam is generated by boilers underground, or is conveyed from the surface in well jacketed pipes.

If natural water power is available water pressure engines working the plunger directly are often employed, and indeed such water-power may be created artificially for use in workings where steam power is objectionable on account of the heat. There are other reasons too for employing water for transmitting power, where the length of the rods is very great, and they have to be worked quickly, there is a great liability to breakages, in order to overcome these difficulties at the mines on the Comstock lode, Mr Joseph Moore[3] uses a steam engine at the surface to work an hydraulic accumulator, and then by pipes conveys the water under pressure to hydraulic engines working plungers. These are fixed at 2100 feet from the surface, and force the water in one column, 13 feet high, to the level of the Sutro tunnel. The exhaust water is returned to the surface in pipes and used over again. The pumps now raising 1600 to 1700 gallons per minute.

Where compressed air is being supplied to a mine for drilling and winding purposes it is often convenient to employ it, by means of direct acting pumps, such as are generally used with steam, for the drainage of small temporary workings, and occasionally large pumps raising considerable quantities of water are worked in this way.

11. *Ventilation and Lighting.* The composition of the air of the atmosphere is about one fifth by volume of oxygen and four fifths of nitrogen, with a little carbonic acid gas; more exactly, the standard amount of oxygen may be taken at 20·9 per cent., and that of the carbonic acid gas at 0·03 per cent. The atmosphere of mines is subject to various deteriorating influences: not only do noxious gases escape from the rocks into the underground excavations, but also the very agents employed in the execution of the work itself pollute the air considerably.

The dangerous emanations of fire damp in collieries have been already described (Coal, vol. vi. p. 729); and with reference to this gas it is simply necessary to say that its presence is not entirely confined to coal mines. Large quantities have been observed in Silver Islet mine,[4] Lake Superior, where several explosions have occurred, whilst small quantities are met with in the stratified ironstone of Cleveland, and also in the Cheshire salt mines; jets of the gas may be seen constantly burning in the salt mine at Bex in Switzerland, a little has been noticed also in lead mines in Wales and Derbyshire. In the Sicilian mines the amount given off by the black carbonaceous shales interstratified with the sulphur beds is sufficient to cause dangerous explosions. It has been pointed out (vol. vi. p. 729) that carbonic acid gas exudes from coal;[5] it escapes also from some mineral veins. At the lead mines of Pontgibaud in central France it is so abundant that special fans have to be provided for getting rid of it; very distinct issues of this gas may be observed at the Foxdale mines in the Isle of Man, and in the Alston Moor district it is no

uncommon. This gas is likewise given off in the Sicilian sulphur mines, where also the highly poisonous sulphuretted hydrogen is of frequent occurrence, the water in the workings being often contaminated with it. Small quantities of mercurial vapour occur in quicksilver mines.

Such then are the principal gases which naturally pollute the atmosphere of mines, and have to be swept out by ventilation. In addition to these we have the products of the respiration of the men and animals in the pit, and those due to the combustion of candles or lamps, and the explosion of gunpowder, dynamite, &c.

Dr Angus Smith[1] reckons that two men working eight hours, and using [illegible] candles, [illegible] cubic feet of air [illegible] breathing, 12·27 [illegible] The products [illegible] studied by Captain [illegible] ing [illegible] show

When explosives are [illegible] way they liberate nitric oxide and carbonic oxide, and the analyses of MM. Sarrau and Vieille confirm the practical experience of miners, who complain greatly of noxious fumes when, owing perhaps to a bad detonator, a charge of dynamite or tonite fails to explode properly.

The air of mines is finally deteriorated by organic matter contained in the exhalations of the men and animals employed and in the products of decaying timber, by dust, and by the solid particles constituting the smoke of explosives. It must be recollected also that the injury to the air is not confined to the addition of the gases and substances just mentioned; but the proportion of oxygen is diminished by the combustion of candles, by respiration, the decay of timber, and decomposition of some minerals such as iron pyrites. Dr Angus Smith[3] sums up the results of his analyses of the air of Barnsley coal mines as follows:

Percentage by volume
[illegible] 20·26
[illegible] 20·18
[illegible] 20·32
[illegible] 20·63
[illegible] 20·77
[illegible] 20·12
[illegible] 20·14
[illegible] 0·785

He considers a [illegible] per cent. oxygen as normal, and air with proportion [illegible] of 20·5 as impure; and where the percentage below 20·6 he calls the air exceedingly bad. In the [illegible] mine [illegible] only 10·67 per cent. of the samples [illegible] to be normal or nearly so; 24·69 per cent. were decidedly bad, while 64·63 per cent. or nearly two-thirds of the samples were extremely bad. The amount of oxygen in one specimen was as low as 18·52 per cent, whilst the carbonic acid often exceeded 1 per cent and in several instances 2 per cent. He says that twenty years ago the ventilation of British mines was bad, but satisfactory, and even now there is room for improvement.

Having explained the reasons why the air of mines must be constantly renewed, we must now point out how this desirable end is effected.

Two systems are employed,—natural ventilation and artificial ventilation; but, as both systems have been described (COAL, vol. vi. p. 70), little remains to be said here, especially as the ventilating machines in metalliferous mines generally cannot for one moment be compared with the powerful appliances employed in collieries. In vein mining there are generally many more shafts than in collieries, and natural currents are set up which are often considered sufficient for ventilating the mines; nevertheless, the advanced workings, such as the ends, rises and winzes, in fact all workings in the form of a *cul-de-sac*, are likely to require special means of ventilation as soon as they proceed a little distance from the main air current.

The means of ventilating a drift or heading are various. If a natural or artificial draught exists at the mouth of the drift, it may be diverted by an upright partition (*brattice*), or an airway may be constructed along the roof or floor by a horizontal partition of planks (*sollar*) (fig. 89). In this way a sufficient supply is directed at the end or fore breast.

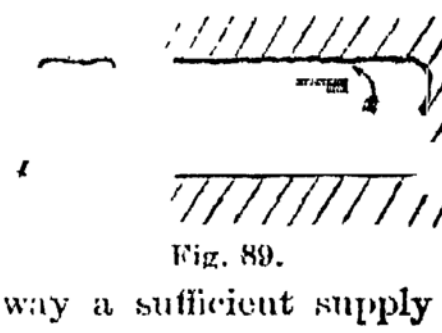

Fig. 89.

The water blast is another simple appliance; it is precisely the same as the well known trompe, and it blows a current of air through square pipes made of board, or better through cylindrical pipes of sheet zinc.

Fig. 90.

The fall of water may be applied by Williams's water-jet, shown in fig. 90. The jet of water acts like an injector and creates a powerful current.

Small fans driven by boys, or better by small water wheels or other machinery, are frequently applied, and the

Harz blower (*duck machine*, Cornwall) (fig. 91) is not uncommon. This is merely an air pump of very simple construction which is worked by the main rod of the pumps, and can be arranged so as to exhaust the foul air or force in fresh air.

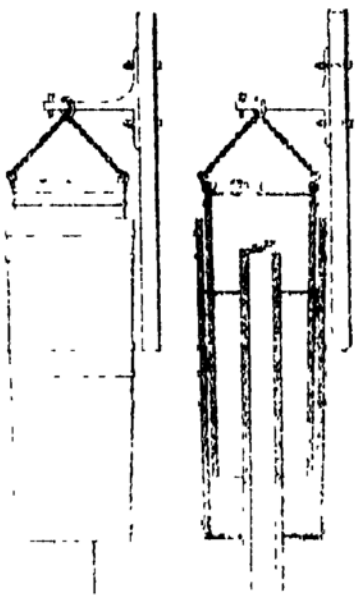

Fig. 91.

In working in blasting ground, boring-machines driven by compressed air are becoming more and more largely used every day, and the exhaust air escaping from the machines is invaluable for ventilation. At the same time, on account of volley firing, the quantities of deleterious gases generated in a short space of time are very considerable, and, in order to get rid of them speedily, the compressed air may be utilized for working a Korting aspirator or the somewhat similar ventilator of Mr Teagite, a jet of compressed air turned into a ventilating pipe, which creates an exhaust (fig. 92[1]). Naturally this ventilator is merely brought into play at the time of blasting, and while the boring machinery is out of use. When compressed air is being supplied on a large scale to a mine for boring and winding machinery, it is often convenient to convey it by a small gas-pipe to working places in which the ventilation is inadequate. Of course, in one sense, it is very uneconomical to compress air to a pressure of 60 or 70 lb to the square inch for ventilating purposes only; but, where compressing machinery is always at work on the mine, it may be better to be a little wasteful of cheap power at the surface than to go to the greater expense of having a man or boy to work a fan underground.

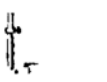

Fig. 92.

Mines are lighted by lamps, torches, candles, and electricity. The subject of safety lamps for fiery mines has already been discussed (see COAL, vol. xi. p. 72), and consequently the question of illuminating mines may be treated in a very summary manner.

Lamps vary very much in shape and size. The Silesian miner has a mere shallow cup of unglazed pottery, the Saxon a small tin or brass lamp in a wooden box lined with tinplate and open in front. In the Harz the miner prefers a heavy flat iron lamp with a hook by which it is stuck into the timber or any crack in the

Fig. 93.

iron lamp is lenticular in shape and also by a hook. In Scotland, and parts of Germany and the United States, a small tin lamp of the shape shown in fig. 93 is very common: the hook enables it to be carried on the hat while climbing ladders, and to be fixed up underground. Olive oil and rape oil are burnt in these lamps; petroleum lamps are employed occasionally.

The miners of England and Wales still cling to the tallow candle; and when surrounded by a lump of clay it can easily and quickly be fixed in the working place or carried upon the hat when climbing. Gas brought down from the surface answers for illuminating large excavations, such as on-setting places and engine rooms.

Up to the present time the electric light has been but little used underground on account of its want of portability, and the smallness of the spaces requiring illumination. Very often a few men only are employed in each working place, and consequently the expense incurred in fixing and shifting the lamps and maintaining them alight would be out of proportion to the value of the work executed. However, an incandescent electric lamp has been invented weighing only 10 lb, which gives the light of three candles for six hours, and it may be reasonably expected that improvements will be made which will render the electric light more available for underground purposes than it is at present. When the area requiring illumination is large, an arc-lamp may be used with advantage.

[1] *Trans. Roy. Geol. Soc. Cornwall*, vol. x. p. 142.

Among the first successful applications of electric lighting to underground excavations may be mentioned that of M. Blavier at the Angers slate quarries.[2] In the year 1879 he fixed two Serrin lamps in one of the large underground chambers with an area of 2400 square yards, and he found that they gave light enough for all the men at work. The total cost, reckoning everything, viz., coal, carbons, repairs, labour, depreciation of plant, and interest on capital, is 50 francs per day; the gas formerly in use cost 54 francs a day and gave much less light. It is evident, however, that the arc light can only be applied with advantage in special cases where a large number of men are concentrated in one working area which can be illuminated from one or two points.

The large chambers in the salt mine at Maros-Ujvár in Hungary have been regularly lighted up by electricity since 1880. The cost is somewhat greater than that of the tallow, oil, or petroleum formerly used, but, on the other hand, the illumination is better, the men can do more work and are more easily supervised, while the air of the mine is not deteriorated by the products of combustion of the lamps.[3]

12. *Means of Descending into and Ascending from Mines.* Where mines are worked by adit levels the men naturally walk in along the ordinary roadway, such mines, however, are exceptional, and the men generally have to climb down and up by ladders, or are raised and lowered by machinery. The means of access to and from workings may be classified as follows: (1) steps and slides, (2) ladders, (3) cages, (4) man-engines.

If a hole or seam inclined at an angle of 30° or 50° from the horizon, steps may be cut in the floor of the deposit if it be firm enough, or wooden steps may be put in with a hand-rail. Even with higher dips steps may be arranged by directing them in a line intermediate between the dip and the strike. In speaking of conveyance underground, reference has already been made to the practice of carrying sulphur ore in Sicily and slate in Germany up to the surface by steps, and steps may be found in other foreign mines and occasionally in Great Britain. They are much less fatiguing than ladders placed so flat that part of the weight of the body rests upon the arms. In some of the Austrian salt mines the men descend by wooden slides inclined at angle varying from 30° to 50°, flattening at the bottom to destroy the velocity gradually; the ascent is effected by steps.

Ladders are very largely used in metal mines all over the world, but they vary a good deal in different countries. The ladder consists of two sides and a series of rungs (*stores*, Cornwall). The sides are usually made of wood and the rungs of wood or iron. The distance between the rungs is important; 10 inches from centre to centre is sufficient, for climbing upon ladders with the rungs 14 inches apart is decidedly more fatiguing. On the Continent wooden rungs are commoner than iron ones, and oak is preferred. Sometimes the wooden staves, instead of being round, are flat, so as to stand more wear, and iron sides may be seen in places where dry rot is very bad. Platforms should be fixed at short intervals, not exceeding 3 or 4 fathoms in perpendicular shafts, so as to prevent falls from having fatal consequences.

In many cases sufficient attention is not paid to the angle of inclination of the ladder. A ladder is climbed with the least fatigue when the person uses his arms simply to steady himself, and is not compelled to pull himself up by them, as on a vertical ladder, or to support much of the weight of his body by them, as happens with a very flat one. The best angle is about 20° from the vertical, and in Belgium the authorities have very wisely decreed that no ladder shall be inclined at an angle of less that 10° from the vertical. Furthermore, of the two arrangements shown in fig. 94,

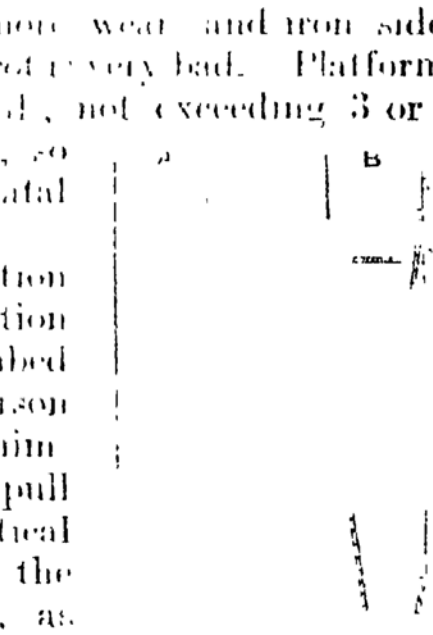

Fig. 94.

[2] M. Blavier, "L'eclairage electrique d'Angers," *Annales des Mines*, ser. 7, vol. xvii., 1880.

[3] *Oesterreichische Zeitschrift für Berg-*, 1882, N. 25, p. 296.

A is better than B, because it not only affords a greater inclination for the ladder, but also renders it less likely that a man will drop through the opening (*manhole*) in the platform (*sollar*) if he loses his hold and falls. These may seem trifling matters; but, leaving aside the question of safety, the economy derived from fixing the ladders at the best inclination is by no means small. To make this apparent we must recollect the depth to and from which men have to climb, viz., 300, 400, and even 500 and it is important, therefore, to avoid every unnecessary expenditure of energy, which, though trifling for one ladder, becomes considerable when repeated a great number of times. When a mine has reached a depth of 900 yards, and *a fortiori* when it exceeds it, mechanical appliances should be introduced for raising and lowering the men, because time and strength are wasted by climbing. Medical men also are agreed that excessive ladder-climbing is injurious to the health of the miner. Therefore, both upon hygienic and financial grounds, one of the first thoughts in working a mine should be the conveyance of the men up and down the shafts by machinery with the least possible fatigue.

In collieries and other mines worked by perpendicular shafts, it has long been customary to raise and lower the men by the ordinary winding machinery already described. In the United Kingdom it is necessary that guides should be used if the shaft exceed 50 yards in depth; safety catches and disengaging hooks (*Coal*, vol. xi. p. 60) are frequently applied for the purpose of preventing accidents. The simplicity of the method of ingress and egress naturally renders it popular, and statistics prove that, where proper precautions are used, it is exceedingly safe.

The first man engine was put up in the Harz in 1833, and one year later a similar machine was fixed in Treuvean mine in Cornwall. Since that time the very useful means of conveying workmen up and down shafts has been reported on in other mining districts, and especially in Belgium and Westphalia.

Two kinds of man engine are in use, the double rod machine and the single rod machine. The double rod or current man engine consists of two reciprocating rods like the main rods of pumps, carrying small platforms upon which the men stand. The stroke is from 6 to 16 feet, and the little platforms are so arranged that they are always opposite each other at the beginning and end of each stroke. Figs. 95 and 96 represent the rods in the two final positions. A man who wishes to descend steps upon platform *b* (fig. 95), the rod B goes down, and A goes up so that *a* (fig. 96) is brought opposite *b*. The man steps across from *b* to *c*, and then the rod A makes a down stroke, B an up-stroke. Platform *c* is now opposite to *a* (fig. 96), and the man again steps across, and so on, constantly stepping from the rod as it comes to its down stroke, the man is gradually conveyed to the bottom of the shaft. By reversing the process, in other words by stepping off on to the opposite platforms as soon as the rod has completed its up stroke to where it is level to the surface, without waiting to be beyond the reach of the next coming platform of stepping sideways. Boards should be fixed up and down the shaft at each platform to indicate the direction of the descent will be opposite to each.

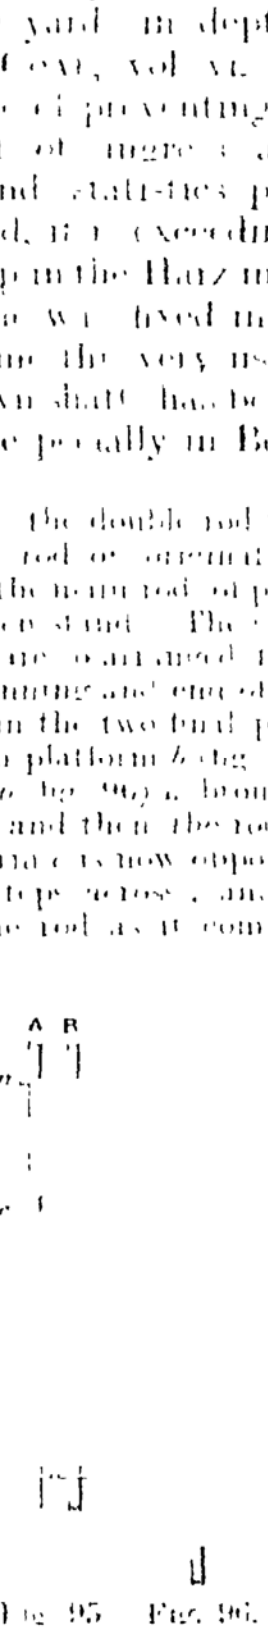

Fig. 95. Fig. 96. Fig. 97.

The single rod engine consists of one rod carrying steps instead of platforms arranged at the proper distance to correspond exactly with them (fig. 97). If a man wishes to go down, he steps on to A when the up stroke is completed; the rod goes down and A is brought down opposite to the fixed platform *b*, on to which he steps off. He then waits on *b* until the rod has finished its up stroke. B is brought opposite *b*; he steps on to B, the rod goes down and he is brought opposite *c*, where he steps off again on to it. By reversing the operation he is gradually lifted to the top of the shaft. The single rod engine may be used by men going up while others are going down, provided that there is sufficient room upon the fixed platforms (*sollars*). The best plan is to have sollars right and left, as shown in the figure, and then the ascending men step off to the left, for instance, while the descending men take the right-hand sollar. The ascending man steps on to the man engine as soon as the descending man steps off, and so the rod may be always carrying men up or down. The usual stroke in Cornwall is 12 feet, and there are from three to five or six strokes a minute. With five strokes the men descend 10 fathoms a minute, or in other words a descent of a depth of 300 fathoms occupies half an hour. The requisite motion is to be obtained from a crank, because in this case the speed is diminished gradually at the dead points, and the danger of an accident in stepping off and on is thereby diminished. Man-engines, however, are sometimes driven by direct-acting engine

Man engine rods are constructed of wood or iron; and at A[illegible] driven by the flat rods replaced by two wire ropes. Like a pump rod the man engine rod requires proper balance bobs and catches, and for the safety of the men a handle is provided at a convenient height above each step.

The man engine has one great advantage over the cage, which consists in the fact that it can be safely applied in inclined and even [illegible] worked both in adopted in many [illegible] for this reason that man-engines have been Careful comparison mines unprovided with vertical shafts. in Prussia [illegible] records safety of travelling have been made accidental d[illegible] cage, man engine, and cages. The average shown by the accompanying table, which [illegible] of five years, 1871 to 1880 —

	Ladders		Cages
Average	3,919	2,491	64,071
Total no.	[illegible]	41	74
Per 100	0·101	0·579	0·115

The table [illegible] the cage is nearly as safe as ladders. [illegible] tance travelled were taken into account, the appar[illegible] ently, because we may fairly assume that [illegible] mate tool by cages are on the whole very much deeper than those in which men ascend and descend by ladders. The men on the appear to be decidedly more dangerous than other [illegible] Here again a distinction requires to be made between the single rod and the double rod machines, and the Prussian statistics include many of the latter. It will be readily understood that a fall in a naked shaft with few fixed platforms is much more likely to be fatal than a fall in the shaft of a single-rod man engine which is closed with the exception of the manhole intervals of 12 feet. The Belgian *warocqueres* are rendered safer than the Harz or Saxon man engines by having a railing round the back of each platform on the rod. Some of the double-rod machines are made with large platforms so that two persons can stand on them, one going up and the other going down, or both travelling in the same direction. The use of double rod man engines has been entirely abandoned in the United Kingdom. The death-rate from accidents on man-engines in Cornwall and Devon during the nine years 1873 to 1881 was 0·17 per 1000 persons using them, whilst the annual death rate per 1000 persons using ladders was slightly higher, viz., 0·19. If the actual distance travelled were taken into account, the scale would turn more decidedly in favour of the man engine.

The cost of raising and lowering men by the man-engine is small. At Dolcoath, a tin mine in Cornwall approaching 400 fathoms in depth (see figs. 62, 63), it is reckoned that 1½d. per man per day covers all expenses, including interest upon the capital expended and depreciation of plant.

13. *Dressing or Mechanical Preparation of Ores.*—In a large number of cases the mineral, as it is raised from the mine, is not ready for sale. It usually requires to be subjected to mechanical processes whereby the good ore is entirely or partly freed from valueless veinstone. These processes, which in a few special instances are aided by calcination in furnaces, are known as the dressing or mechanical preparation of the ores. As a rule the valuable ore is specifically heavier than the veinstone, and most of the separating processes are based upon the fact that the heavy particles of ore will fall in water more quickly than the light particles of veinstone.

The processes of mechanical preparation may be classified as follows: (1) washing and hand-sorting; (2) disintegration, or reduction in size; (3) classification by size or equivalence; (4) concentration.

(1) Sometimes the ore coming from the mine requires simply to be freed from adhering particles of clay in order

o be rendered fit for sale, at other times the washing is ecessary as a preliminary process previous to sorting by and. The operation is performed either by raking the re backwards and forwards upon a grating under a stream f water, or in a box containing water, or, thirdly, by neans of an inclined revolving iron drum worked by hand r any other motive power. The machines used for this urpose, known as washing trommels, are revolving ylinders or truncated cones of sheet iron provided with eeth inside. The ore is fed in at one end, is subjected to he action of a stream of water, and is discharged at the ther end.

The *stuff*, *i.e.*, the mixed ore, veinstone, and country ock, having been cleansed, it is now possible to make a eparation by hand. Women and children are generally mployed for this work, as their labour is cheaper and heir sight sharper than that of men. The stuff is spread ut on a table, and various classes are picked out according o the nature of the products furnished by the mine. Thus in a lead mine we may have (*a*) clean galena, (*b*) ixed ore, *i.e.*, pieces consisting partly of galena and artly of barren veinstone, (*c*) barren veinstone and country ock. This is a most simple case; very frequently we ave to deal with a vein producing ore of two metals, specially in the case of lead and zinc, and then the lassification into various qualities becomes more complicated.

(2) Reduction in size is necessary for two reasons. Even when an ore is sufficiently clean for the smelter the large umps are often crushed by the miner for the sake of obtaining a fair sample of the whole or sometimes a product which is at once fit for the furnace. The chief eason, however, for disintegration lies in the fact that the particles of ore are generally found enclosed in or adhering o particles of barren veinstone.

The disintegration is effected by hand or by machinery. Large blocks of ore and veinstone are broken by men with arge sledge hammers, and the reduction in size is continued very often by women with smaller hammers. Sometimes he blow of the hammer is directed so as to separate the good from the poorer parts, and hand picking accompanies his process, called *cobbing*. Ore may be crushed fine by a flat-headed hammer (*bucking iron*) on an iron plate.

The machines used for reducing ore to smaller sizes are very numerous; here it is impossible to do more than briefly call attention to those most commonly used. These re stone-breakers, stamps, rolls, mills, and centrifugal pulverizers.

The stone-breaker, or rock breaker, is a machine with two jaws, one of which is made to approach the other, and

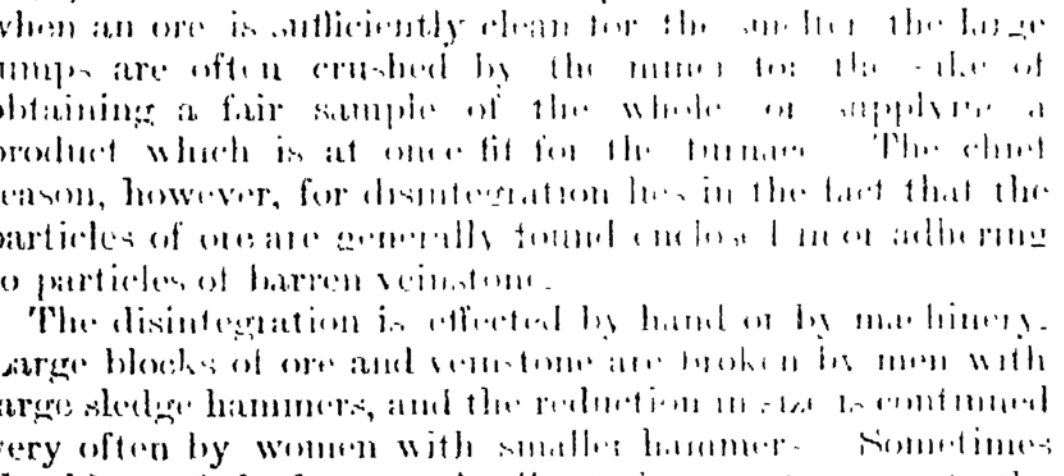

Fig. 98. Blake's Stonebreaker, improved by Marsden.

so crack any stone which lies between them. The best-known stone-breaker is the machine invented by Blake, which has rendered inestimable services to the miner for the last twenty years, and the introduction of which constituted a most important step in advance in the art of ore dressing. Its mode of action is very simple. When the shaft A (fig. 98) revolves, an excentric raises the "pitman" B, and this, by means of the toggle-plates C, C, causes the movable jaw D to approach the fixed jaw by about ¾ inch at the bottom. When the pitman descends the jaw is drawn back by an india rubber spring. The jaws are usually fluted, the ridges of one jaw being opposite the grooves of the other, and they are so constructed that the wearing part are quickly and easily replaced.

Mr Marsden of Leeds has lately introduced a pulverizer constructed on the principle of the stone-breaker, which will reduce large stones to the finest powder in one operation. The moving jaw has an up-and-down as well as the old backward and forwards motion, and the stones are first cracked and then ground by the double action.

Stamps are perhaps and mortars worked by machinery. The construction of the modern California stamp mill with revolving head-gear explained in Globe, vol. x. p. 717, and the description need not be repeated. In Cornwall the older form, with rectangular heads, still prevails.

It is impossible to give any correct average figure representing the work done by a stamping mill, because this varies with the hardness of the stuff treated and the fineness to which it must be reduced. However, it is usual in Cornwall to reckon 1 ton of tin-stuff and in California to 1½ ton of gold quartz stamped per horse-power in twenty four hours.

Stamps are principally used in dressing the ores of gold, silver, and tin, but are occasionally employed for those of copper and lead. The stamps described at vol. x. p. 717 act simply by gravity. Another form, which has met with favour in the Lake Superior district, is the direct acting or Ball stamp, which works like a steam hammer, the blow of the head being assisted by the pressure of steam. At the Calumet and Hecla Mill, Lake Superior, each Ball stamp is capable of crushing 130 tons in twenty four hours. In a third kind of stamps, the heads are lifted by a crank and the power of the up-stroke compresses a cushion of air (pneumatic stamps) or a spring, storing the power which makes the down-stroke strike a heavier blow.

Revolving rolls were introduced in the west of England in the early part of the present century to replace *bucking* by hand. The machine, now often known as the Cornish crusher, consists of two cast iron or steel cylinders which revolve towards each other, whilst at the same time they are kept pressed together by levers or springs. The cylinders or rolls are generally from 18 inches to 2 feet 2 feet 8 inches in diameter and 12 to 22 inches wide.

Stone mills constructed like flour mills are employed in some countries for reducing ores to powder; and the *arrastra*, which consists of heavy stones dragged round upon a stone bed, has rendered good service in grinding amalgamating gold and silver ores, in spite of its being slow and comparatively crude. Edge runners (Chilian mills) also deserve mention.

Iron mills, known as *pans*, with grinding surfaces made of chilled cast iron and arranged so that they can be quickly and easily replaced when worn out, are greatly in vogue in the United States for the treatment of ores of gold and silver. The ore delivered to them is already finely divided, and they are intended, not only still further to reduce the size of the particles, but also and more especially to effect the amalgamation of the precious metals with quicksilver. The pulverizers used in Cornwall for grinding grains of tin ore with a little waste still adhering to them are also iron mills.

The centrifugal pulverizers are machines by which

ieces of ore are thrown with great velocity against bars or rms, or against each other, and so reduced to powder; in ther machines iron balls or iron rollers are whirled by entrifugal force against an iron casing and grind any ineral contained inside it. These pulverizers are much ess used than stone breakers, stamps, and rolls for the dis ntegration of metal.

(3) Classification of crushed ore into sizes is absolutely necessary in some cases and advisable in others, because the success of concentration is dependent upon the fall of the particles in water, as will be presently explained. The classification by size is effected by sieves. Hand sieves and flat sieves placed one above the other have been superseded at most dressing establishments by cylindrical or conical revolving screens known as trommels. These are made of wire web or of perforated sheets of metal, and they are often arranged so as to discharge one into the other, so that the ore from a crushing machine can quickly be separated into classes of various sizes.

With sizes of less than 1 millimetre ($\frac{1}{25}$ inch) trommels are no longer employed and recourse is had to the so-called pulsators or classifiers. These consist of boxes in the shape of inverted cones or pyramids into which the finely crushed ore is brought by means of a current of water; a jet of clean water is often made to rise up in the bottom, the finer and the specifically heavier particles fall and are discharged with a stream of water at or near the bottom, whilst the smaller and specifically lighter particles flow away at the top. The separators do not effect a true classification by size, they merely cause a division by *equivalence*, a term which will be explained immediately.

(4) We now have to deal with the enriching of the ore,

bulk as is economically advantageous. The concentration generally brought about by the fall of the particles in water. Occasionally the fall in an artificial mercury is employed as a collecting agent in the case of gold and silver, and in a few instances magnetism can be applied.

The concentration in water depends upon the difference in specific gravity of the valuable ore and the waste vein stone or rock. A piece of galena with a specific gravity of 7·5 will sink to the bottom more quickly than a similar piece of quartz, the density of which is only 2·6. Nevertheless a large piece of quartz may fall to the bottom more quickly than a small piece of galena. Particles which have equal velocities of fall though differing in size and specific gravity are said to be *equal falling*, or *equivalent*. Even thus a piece of flat quartz of $\frac{1}{4}$ inch in diameter would sink in water exactly as quickly as a piece of galena of $\frac{1}{8}$ inch in diameter, and these two particles would therefore equal falling. Consequently, before we can successfully proceed by water it is necessary to classify the ore in such a manner that equivalence shall not prevent a proper separation of the substances. It is nevertheless true that in the case of the fall of equivalent grains the difference of specific gravity preponderates, and the denser particles fall the least; therefore, by a frequent repetition of the operation of falls, particles which have not been completely separated by a heavy one are separated.

The principal machines for concentrating particles of sizes ranging between 1 inch and $\frac{1}{10}$ inch is the jig or jigger. The hand jigger is a circular round sieve which is charged with the crushed ore and worked up and down in a box full of water. The process is to rationally arrange them selves in layers the heaviest at the bottom and the lightest at the top. On lifting out the sieve the light waste can be skimmed off with a scraper, leaving the concentrated product below ready for the sieve or for further treatment. Similar sieves worked by machinery were for a long time employed in dressing establishments, but the introduction of the improved continuous jiggers has led to their abandonment in all works of any importance. The continuous jigger is one of the most useful dressing machines of the present day. It consists of a box or hutch divided by a partial partition into two compartments; in one is fixed a flat sieve *s* (fig. 99), which carries the ore, and in the other a piston *p* is made to work up and down by means of an excentric. The hutch being full of water, the movement of the piston causes the water to rise up and fall down through the ore, lifting it and letting it fall repeatedly. The effect of these frequent lifts and falls is to cause a separation of the previously sized ore into layers of rich mineral at the bottom, light waste at the top, and particles of ore mixed with waste in the middle.

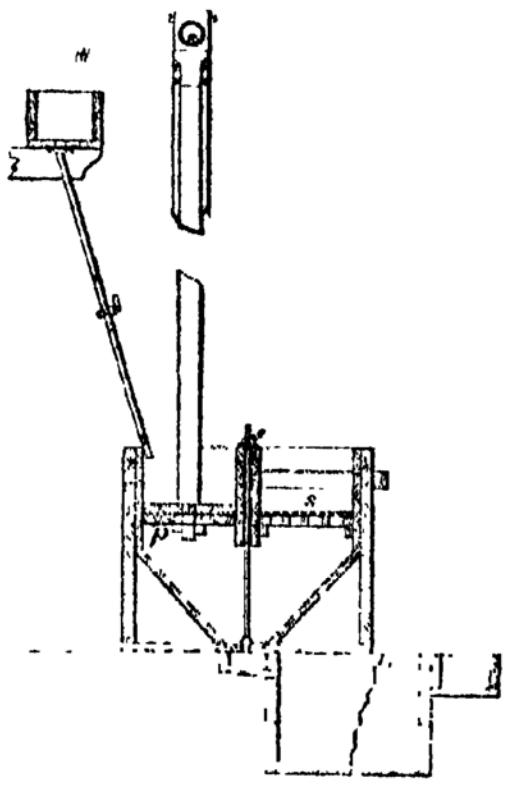

Fig. 99.

The great value of the apparatus is the continuous discharge of the products without stoppage for their removal. Several methods are in vogue viz., the end discharge, the central discharge, and the discharge through the meshes of the sieve. With the first, the enriched product lying at the bottom of the sieve passes out through openings at the end of the jigger, and the amount escaping is governed by an adjustable shutter, by which the size of the [illegible] diminished at pleasure; the middle product can be discharged by openings placed a little higher up, whilst the waste is washed over the top of the end of the jigger at each pulsation. Very often a first sieve simply separates a concentrated product and discharges the poorer product into a second sieve, where a similar separation is effected. With the central discharge, a pipe is brought up through the bottom of the sieve, and the size of the opening for the escape of the concentrated ore is regulated by a cylindrical cap which can be raised or lowered by a screw. The discharge through the case specially adapted for the finer products, the crushed though it is also used in some cases for grains up to $\frac{1}{2}$ inch in diameter. The mesh of the sieve is chosen so that the particles of [illegible] treatment will not pass through, but above the sieve a layer of clean ore is placed which prevents anything but the heaviest particles from being discharged. The pulsations of the water, as before, cause a separation into layers, and the heavy rich particles find their way through the bed and drop into the hutch, whence they can be drawn off through a hole at pleasure. The poorer part passes over a simple sill at the end of the sieve on to a second sieve if necessary. Three or four sieves are occasionally arranged in a row in one machine.

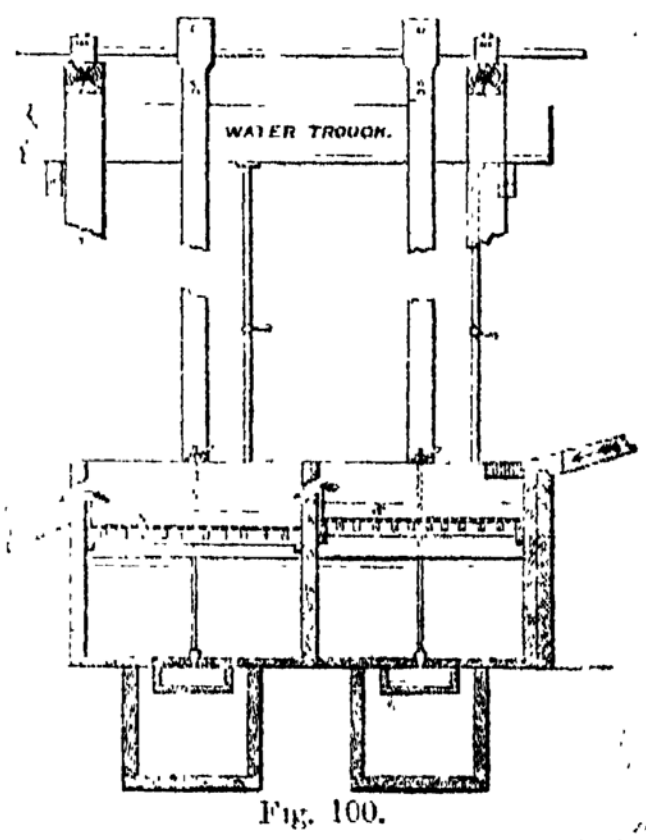

Fig. 100.

Fig. 100 is a section through the two sieves of a Harz sand jig. The pistons act in the manner explained by fig. 99.

The smaller sizes are concentrated by a variety of machines. The action of many of them is based upon the behaviour of particles carried down an inclined plane by a thin stream of water. If the gradient of the plane and the strength of the thin current are properly arranged, the denser particles will be deposited and the specifically lighter ones washed away, although they may be *equal-falling* if allowed to settle in deep water.

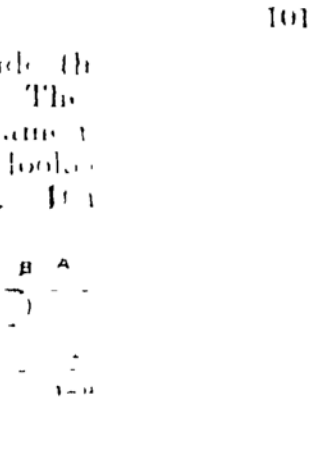
The principal machines for concentrating fine sands and slimes are the frame, rotating frame, percussion frame, side-blow percussion frame, revolving belt and Frue vanner, the hand buddle, the round buddle, and the keeve.

The frame is simply an inclined wooden table upon which a thin deposit is formed by the sheet of ore and-waste-bearing water which is made to flow over it gently. The stream is then stopped and the deposit washed off by hand or automatically, and collected in pits for subsequent retreatment by similar appliances if necessary.

The rotating frame is a round table with a very flat conical surface; the ore for suspension flows on at or near the centre and forms a thin deposit which is richest at the centre and poorest at the bottom, and thus deposit is washed off in two classes by means of jets of water, under which the table as it turns round. Concave rotating tables, fed at the centre, are also employed.

The percussion frame, the *Stossherd* of the German, consists of a table suspended by four chains which receives a succession of slows from a cam in the direction of the stream flowing over the table. Each blow it bumps against a piece of timber before receiving the next blow. These bumps cause the ore to settle, and when a sufficient deposit is formed it is dug off with the lowest part being richer than the middle or the tail.

Rittinger's side-blow percussion frame consists of a square table ABCD (fig. 101), receiving blows and compressed air on the end. A stream of ore and water S is fed on at the corner A; clean water W is supplied by the other head-boards H, H, H, and the table is pushed out by cams in the direction of the arrow, and is driven back by a spring so that the cross-piece E strikes against a jumping-block K. The light particles travel down the table much faster than the heavy ones, and take a comparatively straight course; whereas the heavy and richer particles remain on the table, subject to the influence of the side-blows, for a much longer time, and travelling along a curved path reach the bottom at F. The middle class is discharged at G and the poor waste at K. The exact degree of richness of the products can be regulated by altering the pointers, strips of wood which can be turned so as to divide the where thought most desirable. The machine over the old percussion frame.



101.

The Frue vanner (fig. 102) may be looked of Brunton's simple revolving belt. It rubber cloth, flanged on each side, which revolves slowly in the direction of the arrows, whilst at the same time it is shaken sideways by a crank motion. The ore-y water is fed on at A, clean water at B. The natural path of the particles is down the inclined belt, but the specifica t and are carried upwards. Those that can resist the action of the stream of clean water at B go over the end and are washed off as the belt passes through the tank. The poor stuff falls into the waste launder. The degree of concentration can be regulated by the slope and speed of the belt and the strength of the stream of ore and water. The Frue vanner has the disadvantage that it makes only two classes, rich and poor, without any intermediate product.

The hand buddle is a rectangular wooden box with a sloping bottom. A stream of fine ore and waste suspended in water is fed in at the upper end and gradually forms a deposit on the bed of the buddle. A boy with a broom keeps the top of the sediment smooth, so as to ensure regularity of action. After a thick deposit has accumulated, it is dug out in sections which decrease in richness from the upper end (*head*) to the lower end (*tail*).

Round buddles, like rotating frames, are of two kinds, convex and concave. The convex round buddle (figs. 103[1] and 104) is a circular pit with a truncated cone, or head, of varying size in the centre, and a bottom sloping towards the circumference. The ore-y stream falling over this head runs down gently, depositing the heaviest particles near the top, the lighter ones further down, whilst the lightest of all flow away at C. The surface of the sediment is kept even by revolving brushes D.

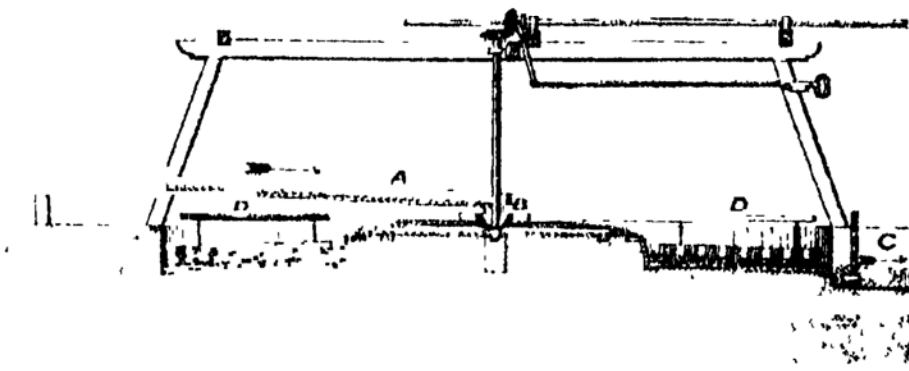


Fig. 103.

a number of hand buddles arranged radially round a centre. The deposit that is formed is dug out in rings of varying richness

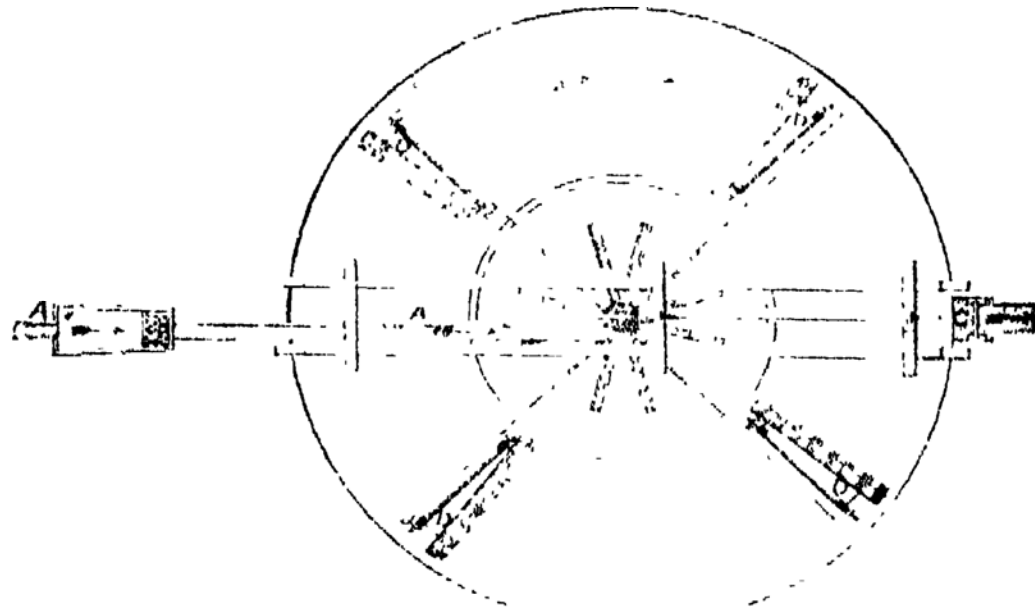

Fig. 104.

The concave buddle is a circular pit with the bottom sloping towards the centre. The stream of ore is fed all round the circumference, and runs inwards to the middle where the lightest particles escape. The rich head is formed near the circumference.

The keeve is a large tub in which the fine stuff is stirred with water and then is allowed to settle from a state of suspension while blows are being struck on the side of the tub. The deposit is afterwards scraped out in layers which increase in richness as they approach the bottom.

The series of processes employed in dressing an ore varies not only according to the nature of the particular mineral to be concentrated, but also according to the size of its particles and the nature of the other minerals with which it is associated.

With gold the reduction in size is usually effected by stone-breakers and stamps and much of the metal is then caught by mercury, whose vapour is concentrated with its accompanying pyrites by inclined tables covered with blankets, or by buddles, and the concentrate is treated by amalgamation or chlorination. See GOLD, vol. x. p. 746.

In the case of silver the ores are frequently pulverized by stamps, and the resultant *pulp* amalgamated in pans or barrels. The ore may also be concentrated by any of the various machines described, and delivered to the smelter. Many of the ores of silver are sent to the smelting works without any concentration by water, as this would cause serious loss.

Lead ore is generally crushed by rolls, often after a preliminary reduction in size by the stone-breaker. The crushed ore is classified by revolving screens down to the size of 1 mm., and the resulting grains concentrated by jigging (*dressing*, or grains of ore and matrix, must be crushed, sized, and jigged. The finer ores are classified by pyramidal boxes and concentrated by frames, rotating tables, and buddles.

Zinc ore is dressed in the same way as lead ores; and, as galena and zinc blende are frequently intimately associated together, it is necessary to separate them by the use of the jig, buddle, and frame.

[1] Henry T. Fergusou, "On the Mechanical Appliances Used for Dressing Tin and Copper Ores in Cornwall," *Proc. Inst. Mech. Engr.*, 1873 pl. 41.

Tin-bearing rock is crushed by the stone-breaker and then stamped fine. The resulting sand and slime may be concentrated by the repeated use of the round buddle, with the kieve for final cleaning; but often the sand only is enriched by the buddle, whilst the very finest particles, constituting an abnormal impalpable mud (*slime*) when mixed with water are treated by frame. When much pyrites is present it is necessary to make a preliminary concentration and roast the enriched product (*calf*) in a furnace. The roasting converts the heavy iron and arsenical pyrites into a light oxide which can be got rid of with the rest of the waste by buddling and framing. The final product from the kieve is clean enough to approach pure tin-stone in the percentage of metal. Alluvial tin-ore is concentrated in *Cornish boxes*, and sometimes by jiggers, after a preliminary treatment in a *puddling machine* (Gould, of which presently). Here there are balls of clay which have to be broken up. When the alluvial ore occurs as a hard conglomerate (*growan*), it has to be stamped.

Copper ores are treated by crushing by rolls and sometimes stamps, sizing by trommels, and then jigging and buddling; but, as some of the ores are very friable and easily carried away by water, hand-picking is employed to a greater extent than with lead and tin ores, and the enrichment by water is not carried so far on account of the inevitable loss that would ensue. The amount of concentration depends upon the distance from the melting works, and the mine-owner has to calculate whether it is best to get a low price for a large quantity of ore, after paying the carriage, or a higher price for a smaller lot (*parcel*) when due allowance has been made for the cost of dressing and loss sustained in that process. Thus, for instance, in Cornwall, the ore containing copper (pyrites) is dressed so as to contain only from 5 to 8 or 9 per cent. of metal, because it can easily be conveyed to Swansea by sea, and because further reduction in bulk would cause greater loss in value than the saving of freight. The loss in dressing is very considerable. P. von Cottinger estimates it at from 30 to 50 per cent., and rubbish facts bear out his conclusion. Heaps of refuse from dressing floors are frequently worked over again with profit, and in the year 1881 no less than 909 tons of "black tin" (*i.e.* concentrated tin ore fit for the smelter), worth £35,283, were extracted from the muddy water allowed to flow away from the dressing floors of some of the principal Cornish tin mines.

The fall in air has been employed instead of the fall in water for underground purposes, and several ingenious air-jets have been contrived and worked upon the principle

[illegible] pound case magnetic attraction may be utilised. Magnetic iron ores separated in this way, and the magnetic product is [illegible] the non-magnetic cassiterite and chlorite, the specific gravity of which is so nearly that under concentration by water practicable. The roasting of the calf and the lode-tin is thus converted into magnetic oxide, which can be extracted by a magnetic separator, as above.

Before concluding the present part of the subject we will briefly enumerate the principal improvements that have been made in metal mining during the last quarter of a century. They are as follow: diamond drill for prospecting; machine drills for driving, sinking, and stoping; use of compressed air for winding underground, stronger explosives, especially the nitro-glycerin compounds dynamite and blasting gelatine, increased use of steel for various purposes; Blake's stone-breaker and continuous jiggers; extended application of hydraulic mining, larger employment of electricity both for blasting purposes and for signalling by telegraph and telephone. It may be reasonably hoped that ere long electricity will render increased services to the miner for lighting the workings and for the transmission of power.

14. *Recent Legislation affecting Mines in the United Kingdom.*[1] In England the person owning the surface of a freehold is *prima facie* entitled to all the minerals underneath, excepting in the case of mines of gold and silver, which belong to the crown. The crown, however, does not claim gold and silver extracted from the ores of the baser metals. The ownership of the minerals can be, and often is, severed from that of the surface, the latter being sold whilst the mineral rights are reserved by the original owner. Local customs, now regulated by Acts of Parliament, are still in force in Derbyshire (High Peak Mining Customs and Mineral Courts Act, 1851, 14 & 15 Vict. c. 94, and the Derbyshire Mining Customs and Mineral Courts Act, 1852, 15 & 16 Vict. c. 136) and in the Forest of Dean (1 & 2 Vict. c. 13, and 21 & 25 Vict. c. 40). The Stannaries Act (32 & 33 Vict. c. 19) regulates the commercial dealings of mining companies in Cornwall and Devon, and provides for their liquidation.

The working of mines in the United Kingdom is controlled by five Acts of Parliament, viz., "The Coal Mines Regulation Act, 1872" (35 & 36 Vict. c. 76), "The Metalliferous Mines Regulation Acts, 1872 and 1877" (35 & 36 Vict. c. 77, and 38 & 39 Vict. c. 39), "The Stratified Ironstone Mines (Gunpowder) Act, 1881" (44 & 45 Vict. c. 26), and "The Slate Mines (Gunpowder) Act, 1882" (45 Vict. c. 3). The last three Acts simply refer to the annual returns, and exemptions from certain restrictions concerning the use of gunpowder.

The Coal Mines Regulation Act applies to mines of coal, stratified ironstone, lead, and fire-clay. The Metalliferous Mines Regulation Act applies to all mines not included under the Coal Mines Act, and therefore controls not only workings for lead, tin, copper, and iron, commonly known as mines, but also the salt-mines, and underground quarries worked for stone, slate, or other earthy minerals. The principal provisions of the Coal Mines Regulation Act have been set forth at vol. vi. p. 78; those of the Metalliferous Mines Regulation Act are similar, but less strict, owing to the almost complete absence of fire-damp. One important difference is that the manager of a mine under the Metalliferous Act need not hold any certificate of competency or service.

Other Acts of Parliament are the "Explosives Act, 1875" (38 Vict. c. 17), regulating the manner in which explosives are stored; the "Elementary Education Acts, 1876 and 1880" (38 & 39 Vict. c. 79, and 43 & 44 Vict. c. 23), regulating the employment of children; the "Factory and Workshop Act, 1878" (41 Vict. c. 16), which applies to the dressing floors of mines under the Metalliferous Mines Regulation Act.

The statute of Elizabeth (43 Eliz. c. 2) which was passed for raising money for the relief of the poor mentions coal mines, but omits other mines; these have been made subject to poor rates by "The Rating Act, 1874" (37 & 38 Vict. c. 54). The "Employers' Liability Act, 1880" (43 & 44 Vict. c. 42), extends and regulates the liability of employers to make compensation for personal injuries suffered by workmen in their service. Finally, if, as sometimes happens, works are put up at a mine for roasting [illegible] ores with [illegible] salt in order to extract the metal by the wet way, the provisions of the "Alkali, &c., Works Regulation Act, 1881" (44 & 45 Vict. c. 37), must be attended to.

It is thus very evident that the laws affecting mines have received most important additions during the last few years.

15. *Accidents in Mines.* Mining is one of the occupations that may decidedly be called hazardous. This fact has been thoroughly impressed upon the public mind by explosions of fire-damp in collieries; but, though accidents of this kind are appalling, owing to the number of victims who perish at one time, fire-damp is by no means the worst enemy with which the miner has to contend. Falls of roof and sides, both in collieries and metal mines are far more fatal in their results. With the risks attending the collier's calling we need not deal, as statistics upon

[1] For information concerning the laws relating to mines in the United Kingdom, see W. Bainbridge, *A Treatise on the Law of Mines and Minerals*, 1878, and Arundel Rogers, *The Law relating to Mines, Minerals, and Quarries in Great Britain and Ireland, with a Summary of the Laws of Foreign States*, 1876.

bject have been already given (see COAL, vol. vi. ; but the figures below relating to metalliferous mines prove that the occupation of the metal mi very little less dangerous.

Mines classed under the Metalliferous Mines Regulation Act in Great Britain and Ireland.

tlavera, nine ye

able I shows that the average accidental mortal employed *underground* in metalliferous mines is During the ten years 1873-82 the coal-producing mines under the Coal Mines Act was 2·95, the e of only 0·20 per 1000 in favour of the metal mi e take the well-known metalliferous district of C on we find a death-rate for the heavy department of 1000, which therefore exceeds that of coal-mine nce to the table shows that more than one-third of t were caused by falls of ground. The other percentage of hs are as follows:—fall of ground in coal-mines 29·7, neons 25·1, on surface 13·1. The accidents to shaft-m all from ladders, cages, and men-engine rods and chains g, overwinding, and other causes, while the miscellaneous s include numerous fatalities connected with hoisting ns. The surface accidents are mostly caused by persons g entangled in machinery, and there have been several fatal xplosions.

te, however, of all the dangers to which miners are exposed, less likely to be the victims of accident than railway ser mong whom the rate of fatal accident varies from 1·5 per passenger traffic lines to 3·5 per 1000 on line-present me goods traffic.

ries concerning accidents in mines are published by many countries; the most minute are those prepared by the nent mining engineers in Prussia. The average annual tes per 1000 persons employed below ground and above from accidents in mines in Prussia during the fifteen years 1881 have been:—coal mines 2·952, lignite mines 1·174, mines 1·446, other mines 1·693, all the mines together 2·176. ing any comparison between the figures and those we have r Great Britain, it is necessary to recollect that the mines he Coal Mines Act include some workings which in Prussia e classed as metalliferous, and that British mines under alliferous Act include underground stone-quarries.

e concluding the subject of accidents, it is necessary to t that successful efforts have been made of late years to their results. In the first place, persons equipped with ss breathing apparatus can now enter mines after explosions, of the noxious and irrespirable gases, and save lives which otherwise be sacrificed.[1] Secondly, by means of the instruc- forded by classes established by the St John Ambulance tion, miners are learning how best to render first aid to the before the arrival of a medical man, and there is no doubt ny valuable lives have been lost in times past for want of owledge. Thirdly, a vast amount of good has been done establishment of Miners' Permanent Relief societies in t districts, which afford aid to persons disabled by accidents the dependent relatives of those who have unfortunately ir lives by any mining fatality.

Useful Minerals produced in Various Parts of the Globe

Britain and Ireland. The mineral produce of the United m for the year 1881 is summed by Mr Robert Hunt[2] as :

	Value.
Gold	
Silver from ore	
Silver from lead	6
Pig-iron	9,261
Tin	859
Copper	
Lead	
Zinc	
Other metals (est	1

has been worked from time immemorial. The output in 1
1[illegible] tons metric of quicksilver.[9]

The cupreous pyrite often known as sulphur ore, is
from the province of Huelva, where vast deposits occur over
country nearly 100 miles long by 20 miles wide. The R
mines are the largest in the district, and are worked on a
cal. The company employs upwards of 10,000 hands,
per cent are engaged in all the Cleveland iron mines,
output is upwards of a million tons per annum. About one
of this, containing 3½ per cent of copper, is exported, manu
manufacture of sulphuric acid and subsequent treatment fo
and silver, while the remaining three-quarters, with 2½ to 2½
of copper, is treated on the spot. The ore contains rather
1 oz. of silver to the ton, and a few grains of gold. These are p
extracted from the burnt ore by Claudet's process, and som
the importance of the copper and silver will be gained by
to the following figures.[10] During the year 1881 there were
from cupreous pyrites imported into the United Kingdom
principally from Spain and Portugal, 14,000 tons of copper, 258
of silver, and 1490 oz. of gold. The total value of the si
gold was £64,195.

The total output of iron ore in 1880 was 3,565,338 metri
more than two-thirds, viz., 2,683,627 tons, being obtained
celebrated mines near Bilbao in the province of Biscay. I
France, Belgium, and Germany are all glad to draw sup

workings for lead and silver appear to have
the greatest vigour between 600 B.C. and the Christian
and were finally abandoned in the 1st century of the Christian
Huge piles of slag which had accumulated from the old
ing works were found to be well worth being re-worked for
and lead, and operations were commenced in 1864. Five
later the old heaps of mine refuse began to be treated, and at
n 1875 a French company resumed working the mine. A
company employing some 3000 persons is now producing
lly from the old mine heaps no less than 8000 to 9000 tons
lead, yielding 45 oz. of silver to the ton, whilst the mines of
mpagnie française des mines du Laurium made an output in
of 36,664 tons (metric) of roasted calamine, with 50 to 60 per
of zinc, in addition to lead ore and mixed ore. Cordella cal-
s that during the three hundred years the Laurium mines were
d by the ancients the total amount of lead produced was
,000 tons, with 22½ million troy oz. of silver. Besides this the
nts left behind two million tons of lead slag containing on an
ge 10·67 per cent. of lead, 109 million tons of mine refuse
½ to 18 per cent. of lead, and excavations to the extent of 51
n cubic yards with lead ore still in sight. They did not
the calamine deposits.[1] Next in importance to lead, silver
ine comes bay-salt, and after that emery. The island of
s furnished 3300 metric tons of emery in 1877, valued at
00.

rica.—Algeria is rich in iron, and three-fourths of the value
total mineral output are due to ores of that metal. In
the iron mines produced 614,000 metric tons of ore, Mokta
lid mine, near Bona, alone yielding about 300,000 tons.
a also possesses mines of copper, lead, zinc, and antimony.
e name "Gold Coast" applied to part of the shore of Africa,
es its productiveness of the precious metal, and it is probable
very important supplies of gold will one day be derived from
ns districts of the Dark Continent.
pe Colony possesses rich copper mines in the Namaqualand
on, which in 1882 produced ore and metal worth £331,546;
ver, the most valuable and remarkable mineral deposits of
a at the present time are the diamond mines. The first
onds were obtained from recent gravel in the bed of the Vaal
and it was afterwards discovered that the precious stones
be obtained from the so-called dry diggings. The most rich
nt of these, the Colesberg Kopje, now known as the Kimberley
produced in 1881 diamonds weighing 900,000 carats, worth
5,000. Three other neighbouring mines are Old De Beer's,
yielded 300,000 carats in 1881, worth £600,000, Du Toit's
and Bultfontein. The value of the diamonds raised in South
a since 1870 amounts to forty millions sterling,[2] and the
erley mine alone was estimated in 1877 to have already pro-
d ten million pounds worth of diamonds, extracted from 4
on tons of diamantiferous rock.

dia.—For many centuries India was regarded as p
fabulous mineral wealth, and a strong basis for this rep
found in the existence of traces of mining on a very exten
No doubt in early days India did supply what then appea
very large quantities of metals, and a country that produ
and precious stones is apt to be endowed by the popular m
boundless riches. The actual amounts of mineral raised
at the present day are comparatively small. Gold exists
siderable areas, but it remains to be proved that the gold
the Wynaad and Mysore can be profitably worked by Brit
prise. Diamonds occur and are worked in alluvial

est interest. It consists of native sulphur, gypsum, and
e in a decomposed andesitic lava close to an extinct geyser
ere hot sulphur water still issues. The top of the bank was
t worked for sulphur, and then for sulphur and cinnabar,
ent account mining is carried on in stratified sandstone
e copper mixed with cinnabar and underlying the lava
The most marvellous silver mines in the world are those
Comstock lode in Nevada. A horizontal section of part
t of which is shown on Plate IV., copied from the excellent
Mr J. D. Hague.[2] The strike is nearly
and north and south, the dip about 16° to the east. "The vein
of the Comstock consists of crushed and decomposed
rock, clay, and quartz." Up to January 1, 1880, the
ock had yielded in fifty years about $345,000,000 worth
ion. The total length of its drifts and galleries is about
The number of men employed in the mines in January
was 2800, earning an average of $4 a day. At the same
340 men were at work in the amalgamating mills.[3] The
f the Comstock lode is a true fissure vein. On the 2700 feet level
Yellow Jacket mine Mr Hague found the temperature of the
to be 104°, that of the water 96°. In the water in the Yellow
shaft at a depth of 3000 feet the temperature of 170° Fahr.[4]

During the last few years the Comstock lode has been fal
in productiveness. In 1876 the total yield of the Comstoc
was $or 572,981 (gold, $18,002,906, silver, $20,570,078).
the census year ending May 31 1880, the product of the
Comstock district, including outlying veins, was $6,922,330
$3,109,156; silver, $3,813,174), showing a decline of $31,65
or 82·06 per cent., since 1876.[5]

Though the extraction of silver from its ores may be re
as the business of the metallurgist rather than of the min
must not forget to mention that it is to the necessities of the
ment of the Nevada ores that we owe the system of pan ama
tion first developed in that State and practised since in Colo

Another district in Nevada which cannot be passed
silence is that which contains the Eureka and Richmond mines,
are celebrated, not only for the silver they have produced, b
for the important trial in which the issue hinged upon the
tion of the term vein or lode (p. 111). The bullion produced
Eureka district from ore raised and treated during the censu
ended May 31, 1880, was gold, 62,893 oz.; and silver, 2,0
oz., worth altogether $3,934,621.[6]

The history of Leadville in Colorado seems like a romance
we read of the rapid development of the mines, the creatio
large and important town, the erection of smelting works a
building of railways, under very adverse conditions, in the h
the Rocky Mountains, all within the space of four or five yea
affords additional proof that the miner is the true pion
civilization. The main facts concerning the Leadville depos
admirably summed up by Mr S. F. Emmons, from whose r
we borrow, not only the following facts, but also the geo
section across the district (Plate IV.).

The principal deposits of the region are found at or ne
junction of the porphyry with the Blue limestone, which
lowest member of the Carboniferous formation. This bed is
150 or 200 feet thick, and consists of dark blue dolomitic lime
At the top there are concretions of black chert. The por
occurs in intrusive sheets which generally follow the beddin
almost invariably a white porphyry is found overlying the
limestone. This porphyry is of Secondary age; it is a white
gneous-looking rock, composed of quartz and felspar o
granular texture, in which the porphyritic ingredients, wh
accidental rather than essential, are small rectangular crys
white felspar, occasional double pyramids of quartz, and fresh
gonal plates of biotite or black mica. Along the plane of c
with the porphyry the limestone has been transformed, by a
of gradual replacement, into a vein consisting of argent
galena, cerussite, and enargyrite mixed with the hydrous ox
iron and manganese, chert, granular cavernous quartz, clay,
spar, and "Chinese tale," a silicate and sulphate of alumina.
vein seems to have been formed by aqueous solutions, whic
up their contents from the neighbouring eruptive rocks and b
about the alteration of the limestone as they percolated down
through it. In Carbonate Hill, a gradual passage may be ob
from dolomite into earthy oxides of iron and manganese. The
of workable ore are extremely irregular in shape, size, and di
tion. They are often 30 to 40 feet thick vertically, and occasi
80 feet, but only over a small area. The rich ore bodies are co
est in the upper part of the ore bearing stratum. At Fry
the blue limestone is almost entirely replaced by vein mater

In the census year ended May 31, 1880, Lake County, Col
which includes the Leadville district, produced 28,226 gross
lead with 28·30 oz. of gold and 8,853,946 oz. of silver, of
value of $15,032,464.[8]

The most important copper mines of the United States are
on Lake Superior, where the native metal occurs "in veins, i
masses, or scattered more or less uniformly in certain beds
are either amygdaloid or conglomerates."[9] The principal c
producing districts are in Michigan, where the Portage Lak
trict in Houghton county, contains the famous Calumet and
mine, which alone produced 15,857 tons of copper in 1880, or
half the entire output of the United States. The deposit
whence this vast amount of copper was obtained is a bed o
conglomerate generally called a vein, dipping about 38° north
It has been worked for a depth of 2750 feet on the inclin
and the rock stamped yielded 1½ per cent. of copper.

In conclusion, we will point out that the value of the m
industry in the United States exceeds that of any other coun
the world, Mr Porter estimating it for 1879–1880 at 360 m
dollars, and that of Great Britain at 325 millions.[10] Germany

l rank, followed by France and Russia. The United States 33 per cent [1] of the gold yield of the whole world, 50 per the silver, 22 per cent. of the pig iron,[2] 29 per cent. of the d about 25 per cent. of the lead

o has been renowned for its gold and silver mines ever since nards first took possession of it, and its production is still siderable. Indeed, after the United States, it still produces silver than any other country in the world. The average output of silver during the twenty five years 1851 to 1875 ated by Dr Adolf Soetbeer at 501,520 kilogrammes or 235 oz ;[3] whilst the average annual output of gold during e period was 1785 kilogrammes, or 57,389 oz Tin ore n considerable quantities in Mexico, and is likely to be on a large scale as soon as the tin district is opened up by y.

l America possesses numerous gold mine

America.—Venezuela produces gold, copper, and a little The copper is found at Aroa near the north coast and the the province of Guiana, which is now producing upwards of oz. annually. It is highly probable that the existence of l was known to the Indians, who reported it to Sir Walter , and so led him to undertake his unfortunate expedition in f "El Dorado." French Guiana contains workable deposits and yielded 72,168 oz. in 1880.

ham of the Andes forms a long belt of mineral-producing . Beginning with the United States of Colombia we have ry rich in gold,—the State of Antiquoia being especially l in this respect. The annual yield of all the States is about oz. Colombia has mines of rock salt, yielding 12,000 tons and the emerald mine at Muzo has long been famous. Peru ned for its silver mines, the best known are those of Cerro , situated at an elevation of 14,000 feet above the sea-level into Bolivia, we must notice the silver mines of Potosi, lth of which is proverbial Chili is best known as the l copper-producing country of South America but its silver re not unimportant, and beds of nitrate of soda are largely h.

most remarkable gold mines of Brazil lie in the province of Geraes, whilst diamonds are obtained in that of Matto In the Argentine Republic gold, silver, and copper mine ked, especially in the provinces on the eastern flanks of the

otal annual output of the precious metals in South America ated to be upwards of 300,000 oz. of gold, and 2,000,000 oz. r. In 1877 Chili exported 35,198 metric tons of metallic in addition to ore and regulus

alia.—Australia is remarkably rich in minerals, especially e Gold, vol. x. p. 744), tin, and copper, and its coal depo-its ly to be largely utilized in the future.

nsland, though a young colony, has already made itself for gold and tin, and it also possesses vast resources of coal pper, in addition to the ores of other metals. The quantity sent by escort from the different gold fields was 204,388 oz. , in addition to what was carried by private hands. Tin ore t worked in 1872 near the border of the colony with New Wales, and large quantities of stream tin have been obtained ery shallow alluvial diggings near Stanthorpe. Lake gold, the tin ore is not confined to one district; it occurs and is w at the North Palmer diggings; a little to the south is Western, rich in tin ore, and so is Herberton to the north-e the other side of the Dividing range.

In 1881 New South Wales[4] produced minerals and metals £2,373,191, viz., 149,627 oz. of gold, 1,775,221 tons of coal tons of tin, 5193 tons of copper, 6560 tons of iron, besides oil-shale, and antimony. In addition to the facts concern occurrence of gold already mentioned (*loc. cit.*), it is interest note that auriferous conglomerates containing the precious m payable quantities have been discovered and worked in this in rocks of the age of the Coal Measures.[5] The most import district is that of Vegetable Creek in New England, whic 1872 to 1880 produced 20,988 tons of tin ore The accompa map (fig. 105[6]) shows the recent alluvium which has hitherto

(C. I

ISTRY. Ever since the introduction of monarchical tion into England the sovereign has always been vided by a select body of confidential advisers to he crown in the government of the country. At ol could a king of England act, according to law, t advice in the public concern of the kingdom, stitution of the crown of England and the meth of the privy council are coeval. At the era of rman Conquest the Long council, or as it is now the privy council, was composed of certain chief n, of the aristocracy and great officers of state, y summoned by the crown, with whom the sove natually advised in matters of state and government. e earlier stages of English constitutional history ng's councillors, as confidential servants of the h, were present at every meeting of parliament in to advise upon matters judicial in the House of but in the reign of Richard II. the privy coun solved its judicial connexion with the peers and l an independent jurisdiction of its own. It was reign of Henry VI. that the king's council first l the name of privy council, and it was also during nority of this sovereign that a select council was ly emerging from out of the larger body of the ouncil, which ultimately resulted in the institution modern cabinet. Since the Revolution of 1688, and elopment of the system of parliamentary govern- the privy council has dwindled into comparative ficance when contrasted with its original authority sition. The power once swayed by the privy council exercised by that unrecognized select committee of uncil which we call the cabinet. The practice of ing a few confidential advisers instead of the whole ouncil had been resorted to by English monarchs very early period, but the first mention of the term council in contradistinction to privy council occurs ign of Charles I., when the burden of state affairs usted to the committee of state which Clarendon s anxiously called the "cabinet council." At first nent by cabinet was as unpopular as it was irregular he formation of the first parliamentary ministry by s III. the ministers of the king occupied no ted position in the House of Commons; it was a moot point whether they were entitled to sit at the lower chamber, and they were seldom of one in the administration of matters of importance. the Revolution of 1688 there were ministers, but istry in the modern sense of the word; colleague d again to cohere in the council chamber, and it uncommon thing to see minister opposing one in parliament upon measure that ought to have upported by a united cabinet. As the exchange overnment by prerogative to government by parlia- onsequent upon the Revolution of 1688, developed, House of Commons became more and more the and force of the state, the advantage of having rs in the legislature to explain and defend the es and policy of the executive Government began gradually to be appreciated. The public authority crown being only exercised in acts of administration other word, through the medium of ministers, it absolutely necessary that the advisers of the sov who were responsible for every public act of the cr well as for the general policy they had been called administer, should have seats in both Houses of Parli The presence of ministers in the legislature was the consequence of the substitution of government by ment for the order of things that had existed before Still nearly a century had to elapse before unanimity in the cabinet was recognized as a maxim. From the first parliamentary ministry of W III. until the rise of the second Pitt divisions in the were constantly occurring, and a prime minister ha to fear from the intrigues of his own colleagues tha the tactics of the opposition. In 1812 an attem made to form a ministry consisting of men of political principles, who were invited to accept offi avowedly as a coalition Government, but with an the Whig leaders that their friends should be all majority of one in the cabinet. This offer was d on the plea that to construct a cabinet on "a sys counteraction was inconsistent with the prosecution uniform and beneficial course of policy." From tha it has been an established principle that all cabinets be formed on some basis of political union agreed u the members composing the same when they accep together. It is now also distinctly understood th members of a cabinet are jointly and severally resp for each other's acts, and that any attempt to se between a particular minister and his colleagues i matters is unfair and unconstitutional.

The leading members of an administration constitu CABINET (*q.v.*) The members of an administratio are sworn of the council, but who are not cabinet ters, are the lord-lieutenant of Ireland, the vice-pr of the council for education, the judge advocate g and the chief officers of the royal household. Th ordinate members of an administration who are ne the cabinet, and who are seldom raised to the distinc privy councillors, are the junior lords of the treasu joint secretaries to the treasury, the paymaster gener junior lords of the admiralty, the parliamentary secretaries of state, and the law officers of the crown.

During the present century the power of ministe been greatly extended, and their duties more dis marked out. Owing to the development of the sys parliamentary government, much of the authority formerly belonged to English sovereigns has been del to the hands of responsible ministers. As now interp the leading principles of the British constitution a personal irresponsibility of the sovereign, the respons of ministers, and the inquisitorial power of parliamen the head of affairs is the prime minister, and the diff between theory and practice is curiously exemplif the post he fills. The office is full of anomalies. Li cabinet council the prime minister is unknown to

e constitution, for legally and according to the of the constitution no one privy councillor has as ny superiority over another, yet practically the r is the pivot on which the whole administration He is the medium of intercourse between the and the sovereign; he has to be cognizant of tters of real importance that take place in the t departments so as to exercise a controlling e in the cabinet; he is virtually responsible for sposal of the entire patronage of the crown; he his colleagues, and by his resignation of office s the ministry. Yet, though entrusted with this and wielding an almost absolute authority, he ecory but the equal of the colleagues he appoints ose opposition he can silence by the threat of dis olu The prime minister is nominated by the sovereign ered,' said Sir Robert Peel on his resignation of no opinion as to the choice of a successor That ost the only act which is the personal act of the gn; it is for the sovereign to determine in whom nfidence shall be placed.' Yet this selection by the is practically limited. No prime minister could n the government of the country for any length of no did not possess the confidence of the House of ons; and royal favour, if it were ever unadvisedly d, would ultimately have to yield to a regard for olic interests. As a general rule the prime minister he office of first lord of the treasury, either alone or nexion with that of chancellor of the exchequer. 1806 the premiership was occasionally held in ion with different other offices, a secretaryship of he privy seal, and the like, but it is now almost bly associated with the post of first lord of the y. With the exception of the premier, who e duties re general than departmental, the work of the other rs of the administration is exemplified by the title offices to which they are called. The lord chancellor, ition to the jurisdiction which he exercises in his l capacity, is prolocutor of the House of Lords by ption, the keeper of the sovereign's conscience, the l guardian of all infants, idiots, and lunatics, and to elongs the appointment of all the justices of the hroughout the kingdom. In former times the lord llor was frequently prime minister, the earl of don in the reign of Charles II., however, was the ho occupied that position. The lord president of ncil, who is always a member of the Upper House, es over the department of the privy council, exercises ral superintendence over the education department, s to frame minutes of council upon subjects which belong to any other department of state. Subte to his department are separate establishments in n to public health, the cattle plague and quarantine ost of lord privy seal is one of great trust, though ies are not very onerous, since they simply comit lying the privy seal once or twice a week to a r of patents. Ever since the days of Henry VIII. ivy seal has been the warrant of the legality of from the crown and the authority of the lord llor for affixing the great seal. The lord privy seal ays a member of the cabinet. As his official duties ght he is at liberty to afford assistance to the istration in other ways, and he has often to attend tters which require the investigation of a member Government.

secretaries of state are among the most important members ministry, and within the present century their number has creased and their duties more specially consolidated. The English monarchs were always attended by a learned ecclesi nown at first as their clerk, and afterwards as secretary nducted the royal correspondence; but it was not until the end of the reign of Queen Elizabeth that these functionari called secretaries of state. Upon the direction of public passing from the privy council to the cabinet after 1688, th taries of state began to assume those high duties which now their office one of the most influential of an administration. the reign of Henry VIII. there was generally only one secr state, but at the end of his reign a second principal secret appointed. Owing to the increase of business consequent u union of Scotland, a third secretary, in 1708, was created vacancy occurring in the office in 1746 the third secretaryship dispensed with until 1768, when it was again instituted charge of the increasing colonial business. However, in 1 office was soon abolished, and the charge of the colonies ferred to the home secretary; but owing to the war with F 1794 a third secretary was once more appointed to superint business of the war department, and seven years later the business was attached to that department. In lieu of a fourt tary of state for the exclusive charge of the war department 1858 a fifth secretaryship for India were created. There a four now five principal secretaries of state, four of whom, wi political under secretaries, as they sit in the House of Co One of these secretaries of state is always a member of the H Lord. The secretaries of state are the only authorized c through which the royal pleasure is signified to any part body politic, and the countersignature of one of them is ne to give validity to the instruments thus, while the p immunity of the sovereign, correlative responsible advice t acts provided who is to answer for whatever course the his pursued. The secretaries of state constitute but one of are coordinate in rank and equal in authority. Each is co in general to execute any part of the duties of the secretary the division of duties being a mere matter of arrangement duties are of the deepest importance to the welfare of the The home secretary controls all matters relating to the affairs of the country. He is responsible for the preservation public peace and for the security of life and property thr the kingdom, he exercises extensive powers over the c military authorities of the country, and has a direct con power over the administration of justice and police in the m boroughs, over the police in and around London, and o county constabulary, and he is especially responsible for t exercise of the royal prerogative in the reprieve or pardon of offenders or the commutation of their sentence. The foreig secretary, as his name implies, is the official organ of the crow communication between Great Britain and foreign pow negotiates all treaties or alliances with foreign states, British subjects resident abroad on demand afford protection requires, they may, in case of the failure of ordinary means of enforcement. The s of state for the colonies has to superintend the government various colonial possessions of the British crown, to appo governor over the different dependencies of the crown, an tion or disallows the enactments of the colonial legislatures latter powers by of late years been much curtailed owing establishment of responsible government in most of the c still it is the duty of the secretary of the colonies to secure pe the colonial governments and to offer such instructions as expedient to assist the deliberations of the colonial council promote the welfare of colonial subjects. Until the year direction of military affairs was practically divided betw commander-in-chief at the head of the board of ordna secretary at war, and the secretary of state for war and the Upon the declaration of hostilities between Russia the duties of war minister were separated from those of s secretary, and a secretary of state for war appointed, in who the supreme and responsible authority over the whole business of the country connected therewith is vested by the various orders in council are placed. By orders of the commander-in-chief subject to the approval of the secretary of state for war. The the commander-in-chief exercises command, discipline and p army and the direct superintendence of the *personnel* of th with the exception of those duties everything connected w improvement of the army in peace or war its *matériel* admiralty, the business of which is transacted by the board of the war minist subordinate powers of the commander-in-chief, the secretary British secretaries of state in many instances. The secretary for war is responsible for the crown and not of parliament a is responsible to parliament for the advice he may give sovereign, or act for in the execution of the royal autho prerogative that he is superior to the officer commanding The principle of the constitutional army act that enlistment and honour come to it from the crown but be gone expense equally unquestioned that for all pecuniary purpose is liable to depend on parliament. By the constitution th exercises its authority only through responsible advisers, a it follows that the secretary of state for war is supreme authority in the army, including the officer commanding From 1784 to 1858 the territories belonging to the British

Indies were governed by a department of state called the control in conjunction with the court of directors of the dia Company. In 1858 this double government was d, and the entire administration of the British empire in as assumed by the crown, and all the powers formerly exer- the East India Company and the board of control were ed to a single principal secretary of state. The secretary for is responsible for everything connected with the Indian ment at home and abroad, the whole of the Indian revenues , and the governor-general of India is subject to ion from him in his capacity, not to act a check upon of his otherwise arbitrary administrative powers, this by the aid of a council of state for India, consisting of en, of which however, but the president. The members ncil for India cannot sit in the House of Commons. ature of the other members of the ministry can be briefly . The chancellor of the exchequer at present exercises all s which formerly devolved upon the treasury board; he entire control of all matters relating to the receipt and ment of public money. He frames the annual estimate of the quired to defray the expenditure of government in every of the public service; and it is his duty to lay before the the annual statement of the estimated expenses of govern- of the way and means by which it is proposed to defray harges, including the imposition or remission of taxes. The of the admiralty (since the abolition of the office of lord ral), with the aid of the naval lords who are called the the admiralty, conducts the administration of the entire ce of the empire both at home and abroad, and is re- parliament for all its political proceedings. The admiralty executive board, it is however, subject on certain matters mber of men required for the naval service, the distribution et, the strength of foreign squadrons, &c., to the control binet. The president of the board of trade takes cognizance atters relating to trade and commerce, and has to protect mmercial interests of the United Kingdom; until 1864 it was ssary for the president to have a seat in the cabinet, but date he has always been a cabinet minister in order to his advice on commercial matters a due consideration, in office of vice-president of the board was abolished. The or of the duchy of Lancaster exercises jurisdiction over all of equity relating to land held of the crown in right of the f Lancaster, the office is, however, practically a sinecure, nually filled by a leading statesman whose time is at the t the Government for the consideration of such important s as do not come within the province of other departments. the public works and buildings of Great Britain were for time placed under the control of a responsible minister of n, and were assigned to the charge of the commissioners of d forests; but in 1851 the department of public works was d from the woods and forests and erected into a board under e of the office of her majesty's works and public buildings. commissioner of works is the head of the board and in his placed the custody of the royal palaces and parks and of all buildings not specially assigned to the care of other depart- Since the establishment of his office the first commissioner uently had a seat in the cabinet. The duties of the post eneral of the president of the local government board, and nor members of the administration are so obvious from the the offices they hold as not to call for any special mention. ime minister is responsible for the distribution of the chief of government between the two Houses of Parliament the development of the House of Commons within the entury it is now considered advisable that a larger propor- abinet ministers should have seats in that chamber than now the case. In the first cabinet of George III. only one cabinet was in the House of Commons and thirteen in the Lords. In 17[illegible] Mr Pitt was the sole cabinet minister in mons. In 1801 four cabinet ministers were in the Commons the Lords. In 1804 Mr Pitt and Lord Castlereagh were abinet of twelve, the only ministers in the Commons. In invisible numerals "All the Talents"), of a cabinet of eleven, ere in the Lords and four in the Commons. In 1809 of oval cabinet were peers and four commoners. In 1812, Liverpool cabinet ten were peers and only two commoners , out of a cabinet of fourteen, six were commoners; and in t of a cabinet of fifteen, nine were peers. Since the Reform 1832, however, the cabinet members of Government have ore equally apportioned between the two Houses.

MINK. The genus *Putorius*, belonging to the family *Mustelidæ* or Weasel-like animals (see MAMMALIA, vol. p. 140), contains a few species called Minks, distinguished from the rest by slight structural modifications, and especially by semiaquatic habits. They form the subgenus *Lutreola* of Wagner, the genus *Vison* of Gray. As in members of the genus, the dental formula is $i \frac{3}{3}$, c $m \frac{1}{2}$; total 34. They are distinguished from the Polecats, Stoats, and Weasels, which constitute the remainder group, by the facial part of the skull being narrower more approaching in form that of the Martens, by the molar teeth (especially the first of the upper jaw) larger, by the toes being partially webbed, and by absence of hair in the intervals between the naked pads the soles of the feet. The two best-known species, alike in size, form, colour, and habits that although they wide y separated geographically some zoologists consider their specific distinction, are *P. lutreola*, the *Nörz* or *Nerz* (Marsh Otter) of eastern Europe, and *P. vison* Mink of North America. The former inhabits Poland, and the greater part of Russia, though not east of the Ural mountains. Formerly it extended ward into central Germany, but it is now very rare extinct, in that country. The latter is found in which suit it habitat throughout the whole of America. Another form, *P. sibiricus*, from eastern of which much less is known, appears to connect the Mink with the Polecats.

The name mink has been adopted from the Swedish *mank* to the European animal. Captain John Smith, in his *H* at p. 27, speaks of "Martins, Powlecats, and Minkes," showing that the animal must at that time h distinguished by a vernacular appellation from its congene later authors. Law (1709) and Pennant (1784), if written "Minx." For the following description, chiefly tak the American form though almost equally applicable to Europe we are mainly indebted to Elliott Coues's *Fur Animals of North America*, 1877.

In size it much resembles the English Polecat,—the length head and body being usually from 15 to 18 inches, that of to the end of the hair about 9 inches. The female is consi smaller than the male. The tail is bushy, but tapering at The ears are small, low, rounded, and scarcely project bey adjacent fur. The pelage consists of a dense, soft, matted u mixed with long, full, lustrous hairs on all parts of the b tail. The gloss is greatest on the upper parts; on the bristly hairs predominate. Northern specimens have the fi most glistening pelage; in those from southern regions the difference between the under and over fur, and the whole coarser and harsher. In colour, different specimens presen considerable range of variation, but the animal is ordinarily dark brown, scarcely or not paler below than on the gener parts, but the back is usually the darkest, and the tail black. The under jaw, from the chin about as far back angle of the mouth, is generally white. In the European M upper lip is also white, but, as this occasionally occurs in A specimens, it fails as an absolutely distinguishing character. the white on the chin, there are often other irregular white on the under parts of the body. In very rare instances th tipped with white. The fur, like that of most of the anima group to which it belongs, is an important article of comm

The principal characteristic of the Mink in comparison congeners is its amphibious mode of life. It is to the wat the other Weasels are to the land, or Martens to the trees, essentially aquatic in its habits as the Otter, Beaver, or M and spending perhaps more of its time in the water than it land. It swims with most of the body submerged, and di perfect ease, remaining long without coming to the su breathe. It makes its nest in burrows in the banks of breeding once a year about the month of April, and produc of six young at a birth. Its food consists of frogs, fish, fre molluscs and crustaceans, as well as mice, rats, musk-rats, and small birds. In common with the other animals of the it has a very peculiar and disagreeable effluvium, which, a to Coues, is more powerful, penetrating, and lasting than any animal of the country except the Skunk. It also posse courage, ferocity, and tenacity of life of its allies. Whe young, however, it can be readily tamed, and lately Min been extensively bred in captivity in America both for the their fur and for the purpose of using them in like manner a in England, to clear buildings of rats. (W. H

MINNEAPOLIS, the county seat of Hennepin Minnesota, United States, and in 1880 the first the State as regards population, lies on both banks

Mississippi, at the falls of St Anthony, 14 miles by river above St Paul. The east side was first settled, under the name of St Anthony, which was incorporated as a city in 1860. The west side settlement, named Minneapolis, was incorporated as a city in 1867, and soon surpassed St Anthony in population. In 1872 the two cities were united under the name of Minneapolis. The chief industries are the manufacture of flour and of lumber, for which the falls supply abundant water-power. The Mississippi here flows over a limestone bed resting upon a friable white sandstone; hence erosion is rapid, and the river banks show that the falls have receded from a position at the mouth of the Minnesota river. In 1851 90 feet of the limestone gave way at once, and, as the rock bed extended but 1200 feet above the present site of the falls, the destruction of the water-power was threatened. This has been averted by the construction of an apron, or inclined plane, of timber, with heavy crib-work at the bottom, and the building of a concrete wall in the bed of sandstone behind the falls and underneath the channel of the river. For this work the United States Government appropriated $550,000 and the citizens of Minneapolis contributed $331,500. The city has twenty-seven flour mills, which can produce 29,272 barrels a day. The total product for the year ended September 1, 1882, was 2,301,667 barrels. The shipments of lumber for 1880 were 161,620,000 feet. The population in 1870 was 18,079, and in 1880, 46,887.

MINNESANGER. See GERMANY, vol. x. p. 625.

MINNESOTA, one of the north-western States of the American Union, extending from 43° 30′ N. lat. to the British Possessions (about 49° N. lat.), and from Wisconsin and Lake Superior on the east to Dakota on the west, between the meridians of 89° 39′ and 97° 5′ W. long. Its area, including half of the lakes, straits, and rivers along its boundaries, except Rainy Lake and Lake of the Woods, amounts to 82,365 square miles.

The surface of Minnesota is diversified by few elevations of any great height. In general it is an undulating plain, breaking in some sections into rolling prairie, and traversed by belts of timber. It has an average elevation above sea-level of about 1000 feet. The watershed of the north (which determines the course of the three great continental river systems) and that of the west are not ridges or hills, but elevations whose inclination is almost insensible. The southern and central portions of the State are chiefly rolling prairie, the upper part of which is crossed from N.W. to S.E. by the forest belt known as the Big Woods, a stretch of deciduous forest trees with an area of about 5000 square miles. North of the 47th parallel the great Minnesota pine belt reaches from Lake Superior to the confines of the Red River valley, including the region of the headwaters of the Mississippi and its upper tributaries, as well as those of the Superior streams. North of the pine region there is but a stunted growth of tamarack and dwarf pine. In the north-east are found the rugged elevations of the granite uplift of the shores of Lake Superior, rising to a considerable height; while in the north-west the surface slopes away to the level prairie reaches of the Red River valley. The surface elevation of the State varies from 800 to 2000 feet above sea-level. A short line of hills in the north-east reaches the latter altitude, while only the valleys of the Red River, the Mississippi, and the Minnesota fall below the former.

Geology and Soil.—The geology has not yet been mapped out with the precision attained in other States. The great central zone, from Lake Superior to the south-western extremity of the State, is occupied by granitic and metamorphic rocks, succeeded, in the south-east, by narrower bands of later formation. Within the great Azoic area lies the central watershed of the continent, from which the St Lawrence system sends its waters towards the A[tlantic], the Mississippi towards the Gulf of Mexico, and t[he] River of the North to Hudson's Bay. These pri[mary] rocks carry back the geologic history of Minnesota [to] Silurian times. They form in the north-east, [in the] neighbourhood of Lake Superior, an extremely rou[gh] hilly country, but as they reach the central and [south-] western portions of the State they for the mos[t] disappear beneath the surface drift. The central [is] succeeded, on the south and east, by a stretch of sa[nd-] partially the true red Potsdam and partially a simi[lar] lighter coloured stratum, which some have prop[osed] designate the St Croix Sandstone. Isolated beds [of] stone are found in various parts of the State. The [south-] western corner, stretching east from the Red River [Valley] is believed to be Cretaceous, but the great de[posits] drift and alluvium disturbed by no large rivers, p[resent] a positive conclusion. The Lower Magnesian lim[estone] underlies the extreme south-eastern portion of the [State] and extends along the west side of the Mississi[ppi] point a little below St Paul; thence it takes a [course] almost semicircular, and finally passes out of the S[tate] the south-western boundary. The Trenton lim[estone] occupies a large field in the south and south-e[ast] comes to the surface in long irregular bands, and a[lmost] of it underlies the cities of Minneapolis and S[t Paul] with the adjacent districts. The Galena limesto[ne], Maquoketa shales, the Niagara limestone, and th[e beds] of the Devonian age in turn prevail in the other [parts] of the south and east, while the existence of the S[t Peter] sandstone would scarcely be known but for its outc[rops] along the bluffs of the Mississippi, and at the [famous] waterfall of Minnehaha. From these various for[mations] numerous kinds of stone valuable for building purp[oses] obtained. The grey granite of St Cloud is extreme[ly] [hard]. The Lower Magnesian limestone [yields] especially handsome building stones, the pink li[mestone] known as Kasota stone, and the cream-coloured s[tone] Red Wing, both easily worked, and hardening by e[xposure] to atmospheric changes. Naturally, from its [position] underneath the principal cities of the State, the [Lower] limestone is the most widely used. Sand suita[ble for] glass-making, and argillaceous deposits abound[ing in] clays which make up so large a portion of t[he] surface drift of the State are almost wholly of [Quaternary] origin. Overlying the deposits of sand, gravel, b[owlder] and clay is, in most portions of the State, a [dark] loam, very finely divided, rich in organic matte[r], brown or black in colour, and of the greatest [fertility]. It is this soil which has given to the State its rep[utation] for productiveness. Its depth varies from 2 to 5 [feet] various parts of the State and it has been descr[ibed] Dr Owen as "excellent in quality, rich as well in [organic] matter as in those mineral salts which give rapidit[y of] growth of plants, while it has that durability which [adapts] it to sustain a long succession of crops."

Rivers and Lakes.—The State holds a unique place in [the] water system of the continent. The Mississippi, which [rises] near the centre of the State in Lake Itasca, and [flows] [south-]eastward [across] the State limits a great river, ha[ving] [a width] of 200 feet deep. It drains with its tribu[taries] [the] central portions and a large area of the [western] portion of the [State]. It is navigable as far as St Pe[ter] Minneapolis, the falls of St Anthony afford unrivalled [water-]power for manufacturing. Of the many affluents of t[he] Mississippi the most important is the Minnesota, whic[h], course of about 440 miles flows into the main stream [at] Snelling, 3 miles above St Paul. The source of the Mi[ssissippi] but 1 mile from Lake Traverse, the origin of the Red Ri[ver of the] North, and it is navigable during the high water season [for] 238 miles. Its principal tributaries are the Blue Earth, [Cottonwood], Redwood, Lac qui Parle, and Pomme de Terre. The [Red River] system drains the north-western part of the State, and

MINNESOTA

pass into Hudson Bay, as also do those from the drained by streams flowing to the Rainy Lake river and s along the northern boundary line. East of this lies the ributary to Lake Superior and the St Lawrence system. upon is an area within the State estimated at 9000 square It principal rivers is the St Louis. There are altogether 00 miles of navigable water in Minnesota.

mber of lakes is estimated at seventeen hundred. They are of all t are found chiefly in the northern two thirds of the State. e are divided geologically into glacial or drift lakes,

upwards of

lacustrine basins scooped out by the action of glaciers or relative position of different geological formations. By ers, number give evidence of glacial action in their origin ered over the region most deeply covered by the surface s are peculiarly prevalent in the same district, formerly centre of the Laurentide area of North America. With ce of the ice sheet which once overspread Minnesota a ndless lakes came into existence, and the gentle activity ges, precluding rapid erosive action, has tended to give ce to the depressions constantly there forming. The ers have their sources within the Most of the lakes are characterized by picturesque spots in their sur s. Forest and timber lines which are seldom more water, abounding in various kinds of fish, present ides the sanitary advantages afforded by the lake places for recreation and delightful summer resort they climate to one's taste, temperate, the extreme cold pervaded by northern latitude. The fact that many of are gradually diverted to permit the replacement by agricul- cultivations. The Lake of the Woods, Lake of Superior, lying ot in part in Minnesota are as follow: Lake of the of Spruce miles; Red, 342; Mille Lacs, 198; Leech, 104 46; Winnibigoshish, 72; and Vermilion 63.

and Forests. The flora and fauna present no marked from those of other States on the same latitude. In a of the birds of Minnesota, two hundred and eighty-one e commercial or winter birds, fifty-two species have been , twenty-three of them being permanent residents.

The State lies so far north as to have a low mean temperature and so far inland as to have the character- tal climate. Its elevation above sea level gives an agree- fection to the atmosphere, and makes the prevalence of damp weather unknown. Between June and January an annual variation from the summer heat of southern he winter cold of Montreal. The winters usually com- in November and continue till near the end of March ormal of intense continental cold but is subject to consider- ation. A study of the comparative dryness of the atmo- attained by even the extensive cold. The snowfall ively light during most of the winter, but a prime e precipitation becomes copious, and there are frequently nowfall in February and March. The change from winter ver is rapid, vegetation sometimes seeming to leap into full e growth within the space of a few weeks. The summer some days of intense heat, but, with comparatively rare e, the nights are delightfully cool. Hot days and cool make the ideal weather for a wheat crop, and the ent of animal production in luxuriant growth the vegetable h belong to the middle States. The South-eastern part of Minnesota has an average temperature for the hottest week ed from 85 to 90°, and for the coldest week in winter ven below zero. The mean annual average for all ty of latitude, at sea level, is 40°. Observations at St Paul, over a period of more than thirty-five years, show the ean temperature of spring, 42°.9; summer, 70°.6; r, 47°.1; and winter, 11°.6. The average annual ll is 30 inches. While this is not large, it is ample the purposes of vegetable growth. The average evapo- ration during the spring and autumn months, or in ter part of the year the precipitation, which ches, is sufficient to about 12° for the sum- the annual available growth is done 70 per cent. of the 75 per cent. of the rainfall, and 76 per cent. ring the prevailing winds are from the south- The number of snow-fall on 150 days, and in 16. The extremes of cold which mitigate the actual of the climate, and which for short periods produce a large amount ure on the atmosphere, are those which render a climate l in the highest degree. Minnesota has been for many favourite resort for invalids. The curative properties of its are especially marked in the case of pulmonary complaints.

Agriculture. The leading industry of the State is agriculture. aracter of the surface soil varies in different parts of the h the character of the underlying strata. The fertile land about three fourths of the entire area of the State. The drift soil proper of the south and centre, including the Minn valley and the greater part of that of the Mississippi, contains and calcareous matter, and is interspersed with alluvial bottoms. The limestone soil, in which there is a large calca element, lies chiefly on the western slope of the Mississippi. Red River valley consists of an argillaceous mould, rich in or deposits. Around Lake Superior, wherever arable land is found, it is marked by a rich trap soil. North of the central f area, and in the neighbourhood of the sources of the Mississip much swampy land, susceptible of easy drainage, with a large of sand and other drift detritus, unfavourable to production. and potatoes flourish, and the uplands, which support hard rubers, are suited to general agriculture. To the extreme n the latter, while indicating mineral wealth, is utterly unfit, ex on over broad cultivated areas, for purposes of tillage.

Wheat has hitherto been the staple product of the State and climate are conducive to ensure a large average yield, while superior quality of the grain has given it a wide reputation. other cereals are also cultivated with success. The tenden diversity agriculture, especially in the southern part of the S has been stimulated by several partial failures of the wheat the local ravages and the competition of the farther north-

The area of the State includes 39,791,265 acres surve 19,968,575 acres not surveyed and 2,709,000 acres of lake su The total sale of public and railroad lands in 1879 and 1880 wer ta from 1,000,000 to 1,500,000. It is estimated that the aggrega lands yet unsold consist of three-fourths of which may be profi cultivated, namely 30,000,000 acres, exclusive of the lands be me to the State. White Earth Indian reservation has thirt lower hills of prairie and timber land, and Red Lake reserv contains 3,200,000 acres.

Forestry. A special census bulletin estimates the amoun merchantable white pine standing May 31, 1880, as amounting to 100,000,000 feet. The entire cut for the census year was 340,000,000 feet. Of hardwood forest 3,840,000 acres re capable of yielding 5,000,000 cords of wood.

Every encouragement is afforded both by the railway co tion and the State, to tree-planting on the prairies. A qu section to any one who will plant and keep in good from 10 acres of timber for eight years. In 1880 there were pl 25,331 acres of trees, exclusive of those bordering highways the windbreak along the railroad lines.

Manufactures. The manufactures of Minnesota are yet in infancy. The abundant water power of the State, its proxim the coal belt of lower Lake superior transportation facilities, an large demand for manufactured commodities are, however, ra developing the branch of industry. The most important indus are the manufacture of flour and that of lumber. The former relative profitableness is stated to depend on wheat yield and abun water power. It received its great stimulus from the inve and adoption of the middlings purifying process, which pro the high grade of flour, and to which the hard spring whe Minnesota is especially adapted. Among other manufactu industries actively prosecuted are the making of brick, pot stoneware, and agricultural implements, and also meat-packin

Commerce. The geographical position of Minnesota gives i for its commercial interests. Two continental waterways term within the State. The Mississippi affords continuous navig to European ports during eight months of the year. From D numerous lines of vessels traverse the chain of great lakes, ing from port the products of the west to the eastern seaboard. The great trans-continental railway lines are connected more or directly with the railroad system of the State. Twelve lines of way from every part of Minnesota converge at the contiguous of St Paul and Minneapolis, and three great trunk lines from centre to Chicago secure the advantages of a lively competitio

Education. The common school system is supported by grant, a local tax, and a State tax. The superintendent of instruction is appointed by the governor. County superinten are chosen by popular vote. Common school districts have be of three members each. Six directors are appointed for indepen district. The permanent fund in 1881 was $4,850,000, and current fund $707,8.5. The State university, located at Mi polis, is governed by a board of regents, consisting of the gov of the State, the superintendent of public instruction, the pres of the university, and six others; both sexes are admitted, the sexes. The State supports three normal schools. F two academies and six colleges are sustained by denomination private enterprise.

Administration. — The departments of Government are, as i the States, the legislative, the executive, and the judicial. State contains seventy-eight counties, of which some are subject to change of boundary. From these are elected by dis forty-seven senators and one hundred and three members o House of Representatives. The State officers are a gove lieutenant-governor, secretary of state, treasurer, and atto general, all elected by the people. The term of office is two y

ernor has power to veto separate items of a money bill. The y is elective, and the term of office seven years. The State ents for citizenship are residence in the United States , in the State four months, and in the election district preceding an election. Women are allowed to vote for fficers and upon questions relating to the management of and are also eligible to such offices. No county can con- e than 400 square miles. The legislature meets biennially, ssions may be called, but no session can exceed sixty days h. Under the last apportionment the State is entitled to esentatives in the national Congress.

nnual valuation of property for 1882, as equalized by the ard, gives the personal property as $79,219,11- the real 242,938,170. This represents a total actual value of not le 50,000,000.

Minnesota was still a Territory. But after it had adopted constitution, an amendment was added to the constitution ing the issue of a large amount of bonds in aid of railway- tion. Shortly afterwards, the companies having failed to on contracts and defaulted payment, the State foreclosed gage on the land, franchises, etc., of the roads, and turned ver to other companies. By another amendment to the tion, the payment of the bonds was made contingent upon it of a popular vote. Several proposals having failed to his sanction, the necessity for it was removed, and a

of the supreme court declaring unconstitu- ad. The legislature immediately proceeded to frame an nt proposed by the bondholders, the over 00 worth of new bonds were declared payment of the principal and interest th fied November 1882, by the cession of 500,000 acres of land in lieu of the nent fund, the deficit to be paid out of . These bonds include all the State A tax of 3 per cent. was imposed on all oads within the State, which, after deducting n for educational, penal, and charitable *ution*. The population of the State was 1,2,023 in 1860, 439,706 in 1870, and 361,624 females in 1880. According whites had been born in the State oreign inhabitants of the State, 47,770 c ntries, and 68,277 from the United States, while 77,505 acknowledged the German. The increase of population in the State alone was 75 per cent. The metropolis, capital, and Minneapolis were in 1870 pectively, in 1880; Winona had to, 98 ; ty.—Missionary efforts and the trading en to venture as far into the wilderness of what is now the State of Minn s of its natural features and native ittings. The "Relations" of 1670-71 las. In 1678 a company was formed to with the Du Luth was leader of this expedition, and for ke Superior to the Mississippi by canoe. But

count is that of Louis Hennepin, a R visited the falls of St Anthony, and gave them their name, at of his patron saint. For a century only a few adventu- wild region were a few missionaries and a number of fur who found the profit of the journey to more than counter its perils and hardships. To the latter class belongs Perrot ched the Mississippi by way of the Fox and Wisconsin riv d founded at Lake Pepin the first trading-post in the State. Sueur, a Canadian, who ascended the river from its and established another post above Lake Pepin. Captain ver, the explorer of the country of the upper Mississippi, he falls of St Anthony in 1766, being the first British trad ho reached the spot. On March 30, 1805, Upper Louisiana nized, consisting of Arkansas, Missouri, Iowa, and a large of Minnesota. From this time onward the progress of explo as rapid, and settlement followed in its train. The first xtensive exploration of any large part of what is now ta was made between 1817 and 1823, by Major S. H. Long, nited States engineer corps, in command of a Government on. About the same time the Red River received its first Thomas Douglas, earl of Selkirk, an Englishman of character, went, in 1817, to what is now Winnipeg, by York river. Having been struck with the agricultural ties of the region about the Red River of the North, he a colony of Swiss farmers to settle there. These were dis- d in the country, and unused to the severity of the climate, they finally removed to the vicinity of St Paul and con to the earliest development of the agricultural in- of the State. In 1821 Colonel Snelling built, at the of the Minnesota and Mississippi rivers, a stronghold e named Fort St Anthony. The name was changed to Fort Snelling in his honour, in 1824, and the fort is still an im post as a base of supplies for the newer north-west. T steamboat made its appearance at the head of navigation The settlement of St Paul, one of the oldest towns as wel capital, is commonly dated from 1846, at which time there w shanties on its site. Population now began to arrive in co increasing numbers, and on March 3, 1849, a bill passed Con organizing the Territory. It was proposed at one time to Itasca, but the name Minnesota, meaning, "sky tinted and originally applied to the river bearing that title, wa retained. The western boundary of the territory was fix Missouri river. The population was but 4907, the large had but a few hundred inhabitants, and a large part of th the State still belonged to the Indians. But progress now carried. Upon admission was adopted in 1857, and on May 1 Minnesota was admitted as a State, with a population, ac to the first Territorial census, of 150,037.

One of the first acts of the new State was the issue of f rail bonds noticed above. Soon after came the civil war two months of Lincoln's first call for troops the first Mi regiment, over one thousand strong, was mustered into serv Year of 1862 ten regiments had been called for, and furnish all the States supplied to the Union 25,052 men, one seventh of its entire population. At the outbreak of the

In the meantime there occurred, in 1862, the horrible knowing the Sioux nation. Settlements were cut off, settlers murdered, and even a strong post like Fort Ridg attacked. The outbreak, which swept over a large portion of the several severe encounters were fought, and it was not u State had a thoroughly equipped military force ready for p pose that the Indians began to flock in to give themselves u the time over 760 persons had been murdered, 200 chiefly taken captive, eighteen counties were devastated, and 4,000 were homeless. The property loss was more than $5,000

During the civil and internal disturbances the material prosperity of the State was unabated. Notwithstanding the ha of the civil war, not the least severe the census of 1865 showed a population of 250,099. Railroad construction began to actually carried forward, and in 1870 300 miles were made, a mile were in operation, a road to Lake Superior was com and the Northern Pacific was actively under way. In 1873 to some extent in Texas, over the devastation of locusts d the crops of the south-western counties. The effects relieved by the State, and never to a second the county has experienced.

MINNOW (*Leuciscus phoxinus* or *Phoxinus laevis*), the smallest British cyprinoid readily distinguished by its very small scales, 97 round and in rivers, streams, lake, railway swimming in shoals and shifting its in search of food, which consists of every kind of w and animal substance. It ranges from southern to Scandinavia, and from Ireland into north eastern in the Alps it attains to a height above the sea Cyprinoid viz. to nearly 8000 feet. In natural co between 2 and 3 inches, but in suitable localities p in Germany, it is known to reach a length from inche . The colour varies with age and season, a dark pot or olive-brown above the side always p but the males at some seasons assume a copper-red or purple on the lower parts of the head and The minnow is a very hardy fish, and can also be intr with facility and with great advantage into pond- n there is otherwise a scarcity of food for more v to the pike, trout, perch, and eels.

MINO DI GIOVANNI (1431–1486), called da F was born at Poppi, in the Casentino, in 1431. property at Fiesole whence his usual name account of him is very inaccurate and full of contrad Mino was a friend and fellow worker both with Settignano and Matteo Civitale, all three being ab same age. There is considerable similarity in their showing mutual influence. Mino's sculpture is rem for its gem-like finish and extreme delicacy of de well as for its spirituality and strong devotional No other sculptor portrayed the virginal purity Madonna or the soft infant beauty of the Divine Ch greater tenderness and refinement. Of Mino's works, the finest are in the duomo of Fiesole, the alt

mb of Bishop Sabinata, executed about 1164. In
lia of Florence are some of Mino's most important
re an altar-piece, and the tombs of Bernardo
, 1166, and the Margrave Hugo, 1181—all sculp-
n white marble, with beautiful life-sized recumbent
and standard angels. The pulpit in Prato
d, signed in 1473, is very delicately sculptured,
relief of great minuteness, but somewhat weakly
Soon after the completion of this work Mino
went of some years to Rome, where he executed
fine pieces of sculpture, such as the tomb of Pope
(now in the crypt of St Peter's), the tomb of
Tornabuoni in S. Maria Sopra Minerva, and a
ul little marble tabernacle for the holy oils in
in Trastevere. There can be little doubt that he
the sculptor of several of the very lovely monu
in S. Maria del Popolo, especially those in the
of Bishop Gonnel and Archbishop Rocca, 1482,
marble reredos, also in the sacristy, given by Pope
ler VI. Some of Mino's portrait busts and delicate
bas-reliefs are preserved in the Bargello at Florence;
full of life and expression, though without the
realism of Verrocchio and other sculptors of his

OS, a legendary king of Crete, in whom both
al and religious elements are united. The historical
lies in the fact that an early civilization and mari
ower had its seat in Crete. The Phœnician inter
played a great part in developing this island state,
nos is sometimes called a Phœnician. The name Minoa
found where Phœnician influence was strongest,
Megara. The laws and constitution which existed
very early time in Crete were attributed to Minos,
n they were revealed by Zeus. After his death he
the judge of the dead, he is one of the forms
d by the old conception of the first man, who is
eath king and god among the dead. It is therefore
probable that the name Minos is the Greek form of
mal *Manu*, i.e., "endowed with thinking," which
n the Hindu Manu and the Germanic Mann. As
ther heroized forms of the god of the dead, there
a terrible and a wise and beneficent side in the
r of Minos. Cretan legends described him as the
nt man of the forests and mountains, the lover of
mphs, though his love means death to them. His
localized in the far west, in the land of sunset;
was shown at Camicus near Agrigentum, attached
ple of Aphrodite. He pursued Daedalus thither,
daughter of Cocalus, the king of Agrigentum,
ed by pouring boiling water over him in the bath,
ed with the sun dying in the sea. Minos, the
the dead according to the primal rule, the sun god,
ns over the dead when he dies on the earth,
ted with the moon goddess, who had an oracle
um at Thebes (cf. Europa). The union of the sun
e moon, the bull and the cow, gave rise to many
and ugly legends. Pasiphaë loved the bull of Minos,
ed by the contrivance of Daedalus, and gave birth to
inotaur, half bull and half man. The Minotaur is
those monstrous forms which were suggested to the
fancy by the ghastly and all too common in Oriental
t was shut up in the LABYRINTH (*q.v.*), which was
ted by the skilled artist Daedalus. Now a son of
named Androgeus had been killed by the Athenians,
nos as a punishment required that seven Athenian
youths and seven maidens should be sent every nint
and given up to the Minotaur to be devoured. Wh
sacrifice took place for the third time Theseus came
of the hostages, and slew the Minotaur with the
Ariadne. Throughout these legends we see the
relation of Minos to the Phœnician sun-god Melkart
perceive the way in which different places where Pho
influence can be traced, Athens, Sicily, &c., are b
together in religious myths.

MINOTAUR. See MINOS.

MINSK, a western government of Russia, is bo
by Vilna, Vitebsk, and Moghileff on the N. and E
by Tchernigoff, Kieff, Volhynia, and Grodno on
and W., and has an area of 35,175 square miles
surface undulating and hilly in the north-west, w
narrow plateau and a range of hills of the Tertiary
tion runs to the north-east, separating the basin
Niemen, which flows into the Baltic, from that
Dnieper, which sends its waters into the Black Sea
range, which averages from 800 to 1000 feet, culmin
Lysaya Gora (1129 feet). The remainder of the p
is flat, 150 to 650 feet above the sea-level, covere
sands and clays of the glacial and post-glacial periods
broad shallow depressions, drained by the Berezina a
Pripet, cross the province from north to south an
west to east; and these as well as the triangular
between them, are covered with immense marshes
occupying 200 to 600 square miles), numberless poo
small lakes, peat bogs, downs, and moving sands,
as with dense forests. This country, and especia
south-western part is usually known under the n
Polyesie ("The Woods"). Altogether, marshes f
15 per cent. and marshy forests no less than 55 pe
of the entire area of the province (60 to 71 per c
several districts). The forests, however, consist
grown trees in the higher districts of the nor
only, those which occupy the marshy ground consis
small and stunted pine, birch, and aspen. The cli
the Polyesie is harsh and extremely unhealthy; m
and an endemic disease of the bulbs of the hair
plica Polonica) are the plagues of these tracts, t
being intensified by the dreadful poverty of the
tion. Communication is very difficult. The railwa
Poland to Moscow lies, so far as Minsk is concerned
advantage of the plateau above mentioned; but stil
to cross the broad marshy depression of the Berezi
successful attempt was recently made to drain the
of the Polyesie by a system of canals, and mor
1,500,000 acres have thus been rendered suitable for
and agriculture. Two great tributaries of the Dnie
Berezina and the Pripet, both navigable, with num
subtributaries, many of which are also navigable,
natural outlets for the marshes of the province
Dnieper flows along its south-eastern border for 160
and the Niemen on the north-western for 130 miles
affluent of the Baltic, the Duna (Dwina), and the Vis
connected by three canals with tributaries of the I
The population of the province (1,183,200 in 187
be estimated at about 1,350,000, mostly White R
(67 per cent.), there are also Poles (about 11 per
especially in the western districts, Jews (more t
per cent.) Little Russians (5 per cent.), and Russian
cent.). About 70,000 are considered to be Lithu
there are also 1000 Tartars, whose presence can be
to the raids of their ancestors on Lithuania in th
century, and about 2000 German agriculturists who
in last century.

The chief occupation of the inhabitants is agriculture, w
however, very unproductive in the lowlands; in the Pol
peasants rarely have pure bread to eat. Only 23·8 per cen

nder crops, the average yield being 1,600,000 quarters of
d 1,170,000 quarters of potatoes. Cattle breeding is very
tly developed, the meadows being marshy throughout the
s. Hunting and bee-keeping are sources of income in the
, and fishing gives occupation to about twenty thousand
The chief source of income for the inhabitants of the low
the timber trade. Timber is floated down the rivers, and
h, various products of bark, potash, charcoal, and numerous
imber-ware (wooden dishes, &c.) are manufactured in village
t extent; and shipbuilding is carried on along the Dnieper,
and Niemen. Shipping is also an important source of
owing to the traffic on the canal and rivers of the province
560 boats and 1120 rafts with 1,70,000 cwts. of cargo left
s of the Berezina and Pripet; and the traffic on the Dnieper
nen was nearly as great. The industrial arts are almost
undeveloped. There are, however, several distilleries and
s; and woollen stuffs, candles, tobacco and beer are manu
to a limited extent. Corn is exported from the western
, but imported to the same amount into the southern parts,
f export trade is in produce of forest industries, re pre
crossed by two important railways, one of which
with Moscow, and the other Libau and Vi
s of Little Russia; the great highways from aw to
crosses the province in the south, and its pos homesh
ezina is protected by the fortress
s divided into nine districts, of which th
43,500 inhabitants), Bobruisk (30,850), Bor
place where Napoleon I. crossed the Berez
oscow, Igumen (2200), Mozyr (4700), Ne (9000),
8,000), Ryechitsa (4300), and Slutsk (17,200). The pro
well provided with secondary school, but primary educ
especially in the Polyesie, remains very backward. The
ountry now occupied by the province of Minsk was, as far
ical records extend, an abode of Slavonians. Part portion
ch was occupied by the Krivichi became part of the Polotsk
lity and so of "White Russia," the other portion, occu
the Dregovichi and Drevlians, became part of the "Black
; whilst the south western portion of it was occupied by
s or Lithuanians. During the 12th, 13th, and 14th
was divided among several principalities, which were in
ed with the great principality of Lithuania and later were
to Poland. Russia took possession of the country in
In 1812 it was invaded by the army of Napoleon I.
sk, the capital of the above province, is situated
Svisloch, a tributary of the Berezina, at the
n of the Moscow and Warsaw and the Libau
harkoff railways, 165 miles by rail west from
v. It has 13,500 inhabitants, of whom one third
ws of the poorest class: the others are White
ns, Poles, and Tartars (about 700). The manufac
re few and insignificant. Since the introduction of
s the commercial importance of the place, which
y was slight, has begun to increase.
t is mentioned in Russian annals in the 11th century under
e of Myen'sk or Menesk. In 1066 and 1096 it was held
rst by Izyaslav and afterwards by Vladimir. It changed
any times until the 13th century, when it became a Lithu
f. In the 15th century it became part of Poland, but while
t was ravaged by Tartars, and in 1505 by Russians. In the
ature it was taken several times by Swedes and Russians
nnexed it in 1793. Napoleon I. took it in 1812.

STREL. The "minstrels," according to Bishop
"were an order of men in the Middle Ages who
the arts of poetry and music, and sang verses to the
their own composing, who appear to have accom-
their songs with mimicry and action, and to have
ed such various means of diverting as were much
d in those rude times, and supplied the want of more
entertainments." This conception of the "minstrel"
n generally accepted in England ever since Percy
hed his *Reliques of Ancient Poetry*, which he gave to
rld as the products of the genius of these anonymous
r poets and harpers. The name has been fixed in
guage by the usage of romantic poets and novelists;
"last minstrel" and Moore's "minstrel boy" were
els in Percy's sense of the word. The imagination
cinated by this romantic figure, and the laborious
ured antiquary Ritson argued in vain that nobody
Bishop Percy had ever applied the word minstrel to
order of men, that no such order of men ever did
exist in mediaval England, and that the historical l
"minstrels," so-called, were a much less gifted and r
able class, being really instrumental musicians,
retainers or strollers.

The dispute between Ritson and Percy was partly
pute about a word, and partly a dispute about fa
facts; and there can be little doubt that Ritson was su
tially right in both respects. The romantic bisho
ferred to the mediaval English minstrel the social
and brilliant gifts of the Anglo Saxon *gleeman* or *sc*
the French *troubadour* in the flourishing period of Pro
poetry. That the gleemen sang to the harp verses of the
composing, that some of them travelled from court t
as honoured guests, while others were important at
court officials, and all received costly presents, is
attested historical fact. The household bard at He
the poem of *Beowulf*, a man who bore many things in
and found skilfully linked words to express them, w
of King Hrothgar's thanes, the gleeman of the *Tra*
Sonf had visited all the tribal chiefs of Europe, and re
many precious gifts, rings and bracelets of gold,
incidents in these poems may not be historic, bu
furnish indubitable testimony to the social position
gleeman in those days; a successful gleeman was as
honoured as a modern poet laureate, and as richly re
as a fashionable *prima donna*. Further, the strollin
man of a humbler class seems to have been a recog
non combatant: this much we may infer from the
about Alfred and Anlaff having penetrated an e
camp in the disguise of gleemen, whether the story
true or not, for otherwise they would not have
invented. The position of poets and singers in P
from the 11th to the 13th century is still clearer
classification of them by King Alphonso of Castile n
by which time honourable designation were getting
may help to determine the exact position of the
"minstrel." There was first the lowest class, the
who strolled among the common people, singing
songs, playing on instruments, showing feats of sk
strength, exhibiting learned dogs and goats, and so
then the *joglars* or *joculatores*, who played, sang,
conjured, men of very subtle powers of entertainme
performed at the houses of the nobility, and were li
remunerated, then the *trobadors*, or *inventors*, wh
function it was to compose verses, whether or not th
sufficient executive faculty to sing or recite them.

If we compare these distinctions with Percy's de
of the minstrel, we see that his minstrel would have
sponded with the *poeta* who also wrote his own son
recitations. Now in the palmy days of Provenç
there were many professional joglars, such as
Daniel or Peirol, who stood high among the most h
troubadours, and visited on terms of social equali
nobles and princes. But long before English bec
court language the troubadour had disappeared, and
division of function had been developed. In Ch
times the poet of society no longer sang his verses
or recited in person to his patrons with feats of legerd
the *jongleur* (teller of *gests*) discharged the
social duty, diversified with witty stories and th
position of the *poeta* had very much sunk. But
perfectly right in saying that no English poet of an
position was a professional reciter to the harp of v
his own composing. The Provençal joglar, travellin
court to court, combined our modern function
society journalist, entertainer, and musician. Bu
the time when the word "minstrel" came to be ap
him the English joglar was rapidly sinking or had
sunk to the social position of the modern strolling
hawk, travelling showman, or music hall singer.

instrel had had a separate history before it became
mons (as in the *Catholicon Anglicum* of 1483) with
lator, *histrio*, *scurra*, and other names for strolling
mers. Derived from the Low Latin *ministralis*, it
ferally applied to those retainers whose business it

the organization of the coinage was Athelstan, who
laws for the regulation of the mint, and appointed
whose title and duties are then first recorded. Th
officers connected with the coinage of whom men
found before the time are the "moneyer," who ap
have been alone to provide for the manufacture of th
but it is probable that even then there existed some
who had authority over them. In early Saxon and N
time the number of moneyers was considerable,
being established in almost every important town, a
be expected at a period when communication b
distant places was extremely difficult. They appear
been the officers who actually performed the w
making the coin, the mint-master in later times cont
with them, at high rates, for the work. They were
sible for the purity and perfection of the coins pro
as appears from the fact that it was they who
punished for treason on the case of any deficiency in
or fineness. They had pre-emptive rights in the c
and in modern time (even so late as 1850) claimed
corporate privileges. But it is clear, on the au
of Ruding, that they never were a "corporation" s
from other officers of the mint.[1] The number of
was greatly reduced after the Norman Conques
continued to be considerable until the reign of Ric
when the work of coining for the whole kingdom w
centrated in the mint in the Tower of London. O
provincial mint (Winchester) remained till a later d

No important reorganization of the coinage took
in 1279 under Edward I., the regulations then fra
the manufacture and issue of the coins forming th
of the act still in force. The principal officers under
regulations were master, warden, comptroller, king's
master, king's clerk, and counter. The office of co
was one of great importance at a time when there
a multiplicity of mints, since he had the sole charg
the dies used not only at the mint in the Tower of L
but also in the provinces. He chose the engrave
presented them to the barons of the exchequer in
that they might take the oath of fidelity; he superin
their work, and was generally answerable for the per
of the dies before they were issued for use in the
mint of the country. The office, which was here
ceased to exist when the provincial mints were supp

actual operations of coining in early times were few
ber and simple in character. The metal forming
y were melted together in the proportion necessary
g them to the required standard, and the alloy thus
d was cast into bars, which were reduced by
ring to the requisite thickness. They were then
h shears into pieces more or less regular in size and
roughly annealed, and finally impressed with the
ed device by a blow with a hammer.
last-named appears to have been the only part of
ess which was performed with any great amount of
The blank piece was placed by the hand upon a die
to a block of wood having a large heavy base to
he oscillation caused by the blow, the die on which
graved the device for the reverse of the coin was
ated upon the upper side of the blank, and held by
of a holder, round which was placed a roll of lead to
the hand of the operator while heavy blows were
with a hammer by an assistant workman. One of the
earliest improvements in coining was the introducti
tool in shape resembling a pair of tongs, the two die
placed one at the extremity of each leg. The neces
necessity of readjusting the dies between successive
of the hammer, and ensured greater accuracy in the
sion. It was long before the system of coining by ha
superseded by the coining press or mill, which, even
its introduction, was only very slowly adopted
attempts were made to introduce machinery for
before it was brought into active use the objection
to its great expense. The mill and screw were
introduced into the mint under Charles II., when
improvements were also made in the preliminary oper
steam power was first applied in 1810, when the s
screw press was introduced. In 1839 Uhlhorn's invent
lever press, which still remains in use.
The subject of the decoration of coins is one being
of time both from an artistic and an historical point o
becomes very important when it is remembered th
the impression of the coin with the authorized
which make it legally current. The artistic merit
degree of the early Greek coins are well known and
that the dies from which the coins were struck must
been engraved with much skill and care. The form
coins before being stamped were at first merely
natural rounded nugget of gold, or of the silver o
known as *electrum*. Such coined nugget of gold
to be found among the hill tribes of India
nugget were afterwards replaced by roughly ha
made like ball bullets, a term which rendered it
impart high relief to the obverse and comparative
relief to the reverse of the coins. The early Britis
had for their prototype the gold "staters" of Ph
Macedon, but the design of this beautifully mo
was so roughly imitated by a succession of Britis
that ultimately the wreath round the head of the
alone survived, and that was scarcely recognizable

standard gold, according to the trial of the same of 22 carats fine gold and 2 carats alloy, and the pound weight troy and twelve ounces troy thereof should be coined into one thousand two hundred and forty nine million and two hundred and sixty one thousand and one hundred and fifty two five hundred and twenty four million two hundred and eighty eighth quarter quarter sovereigns contained in 20 lb weight troy of standard gold, according to the trial of the same of 22 carats fine gold and 2 carats alloy, and the pound weight troy and twelve ounces troy thereof should be coined into two thousand four hundred and eighty

ad to be the weight of coin which could be manu
d in a day when the operations of coining were
ned by the head. The journey weight of gold is
troy, equal to 701 sovereigns or 1402 half-
ons. The journey weight of silver is 60 lb
from each journey weight a coin is taken and
of its pyx or chest for the annual trial. Thus
the trial of the gold mark company under
the crown in the presence of the queen's
or who administers the oath to the jury and
proceedings. The coin selected for trial
compared with pieces cut from trial plates of standard
which are in the keeping of the warden of the
the pieces being arrayed against the coin-
examination. If the coin are found to be of the
fineness and weight, within certain limits, a verdict
effect is drawn up by the jurors and presented to
a jury.

on account of the impossibility of ensuring an abso
exact admixture of metals in coinage, it has been
ecessary at all times to allow to the mint master
n margin, or "remedy" within which coins may
weight and fineness from the fixed standard and
considered of the current standard. The remedy
es for English gold coin is now fixed at 2 parts
000. The great importance of maintaining the
d of fineness for gold will be evident when it
hat the variation of $\frac{1}{10}$ of a millionth or thousandth
above or below the standard causes a gain or loss
00 in every million sterling. Gold coin would
hin the remedy of fineness permitted by law if
unt of precious metal contained in them varied
116 to 918·6 parts in 1000, and, although this
cannot be considered to be more than would
ecessarily and unavoidably occur even from the exact
d, still, in the case of gold, but a very small part of
medy of fineness is actually used, the coin seldom
below 916·3 parts of gold in 1000 or rising above
while the mean composition of each million of
ined from the mint is often of the precise legal
d, 916·66. The remedy of fineness for silver coin
appears to have been always greater than that for
n, it is 4 parts per 1000. The remedy of weight
l is 1·6 per 1000 parts, that for silver 1·17, and
bronze 2·0. Extreme care is taken to prevent the
om the mint of any coin that exceed these permitted
ns in weight and fineness, each piece being weighed
dy, and all that are found to be above or below the
d being returned to the melting-pot.

the real value of the gold coin at the same n
inal value, it is of the first importance that gold
hall not be below the standard weight should not be
to circulate, otherwise bullion or base coin might be
e profitable to counterfeit. After a certain
of wear coin ceases to pass current from hand to hand
ceases to be legally current. By the Coinage
ment Act 1870 a remedy of 1/2 grain for every sovereign or half-sovereign
was allowed to him in payment which is
the case with the person tendering it bearing
, but, as experience proved that this regard of the
ion, the law was practically without effect. The
awal of light coin from circulation was formerly
lished solely by the Bank of England, the mint
ions making provision for the receipt of gold tendered
ange only in the form of coin. The bank undertook
buy the light gold from the public at the rate of
. 6½d. an ounce, a price which, when compared with
t value of £3 17s. 10½d., meant a loss of no less
l an ounce on the seller. This loss was occasioned
by the circumstance that the bank, being obliged before sending the light gold to the mint for recoi
nage, assay, and cast it into bars, found it neces
deduct the sum of 2½d. an ounce from the rate of £
9d. an ounce at which it was allowed by statute to p
gold for coinage, in order to cover the expense o
operations and the loss incident to them. The loss
in price, added to that from deficient weight, occ
constant disregard of the law requiring all light coi
cut or defaced, and consequently a large amount
gold continued to be circulated. After the passing
Coinage Act in 1870, accordingly, fresh regulation
made, by which the mint authorities undertook to
light gold coin for recoinage, returning to the impor
full mint value of £3, 17s. 10½d. an ounce, thus reduc
loss to that arising from deficiency of weight only.
Bank of England was enabled by these regulations
its price for light gold to the rate of £3, 17s. 9d., th
rate at which it is bound to purchase ingots of st
gold, greater inducements were offered to the public
to light gold for recoinage, and its withdrawa
circulation was in consequence greatly facilitated.
evident, however, that, as the deficiency in weigh
entail some loss on the holders of light gold coin, th
be disposed to keep it in circulation as long as po
consequently only a small proportion of the ligh
received by bankers finds its way to the Bank of E
and thence to the mint for recoinage. The result o
careful experiments made by the late Mr Stanley
and published by him in the *Journal of the Statistical*
(vol. xxxi. p. 126), showed that a sovereign beco
light to be legally uncurrent at the end of eighteen
The last state measure taken for the withdrawal o
gold coin from circulation was the issue of a roy
proclamation in 1842 calling attention to the law
regulations relating to light gold coin, and inst
those persons whose duty it was to enforce them
that they were carried out. From the beginning o
1842 to the end of March 1845 £14,000,000 i
gold coin was withdrawn from circulation and re
This amount was estimated to represent 95 per cent
whole of the light gold then in circulation. In o
facilitate this withdrawal the Treasury had in Jun
entered into arrangements with the Bank of Engl
which the bank was enabled to purchase light g
on behalf of the Government, at the full mint value of £
10½d. an ounce. Light coin, however, continue
out into the bank for some time after it had reve
at original rate of payment for light gold, viz., £3, 17
an ounce. The expense to the state of this with
including the expenses of recoinage, was £67,816.
important withdrawal of worn gold coin has occurre
that time, it is evident that a large amount of ligh
must be at the present time in circulation, and th
loss on weight must be considerably greater than
the coins withdrawn in 1842, the oldest of which w
more than twenty-five years old, the first issue having
place in 1817. It has been proved by experiment t
average loss of weight in worn sovereigns and half-sov
now in circulation is about 5d. in each sovereign, a
the deficiency in fineness of a large proportion of t
amount to about £100 per million. This deficienc
from the trial plate of 1829, which determined the st
of a portion of the coins still in circulation, being
below the legal standard. Taking the gold circula
£100,000,000, of which at least 50 per cent. is ligh
estimated that the amount to be recoined cannot
than £50,000,000, on which the loss from defici
gold, both in weight and fineness, must be reckoned a
£650,000, independent of the expenses of recoinage

In the case of the silver coinage, the loss consequen

wal and recoinage of silver money is now covered
seigniorage arising from the difference between the
l the nominal value of the coins. Before the adop-
gold as the sole standard of value, the conditions
ng the withdrawal and recoinage of silver were much
e as they were for gold. In the period between the reign
rles II. and the accession of William III. the
on of the silver coinage became so unsatisfactory as
nd the attention of parliament. A recommendation
t the suggestion of Sir Isaac Newton for a recoinage
r was at first strenuously opposed, but was finally
l. In the course of the discussion the question of
the standard of weight and fineness arose, and this
ut change would probably have been made but for
resentations of Locke, who warmly took up the
n and convinced the Government of the desirability
serving the established standard. In the great
ge of silver, the loss arising from clipped and defaced
s borne by the public, the money being raised by
of a special tax on glass windows. The silver
l at this time amounted to £7,000,000, and the
sed to cover loss and the expenses of coinage to
,000. The work of this recoinage was so great that
ouncers of the mint in London were found to be
l to the pressure put upon them, and therefore
ere either revived or established for the first time
ew of the large provincial towns. In addition to
n furnaces were erected behind the Treasury at
all to melt down the old pieces. By these means
oration of the silver coinage was completed within
r. The new silver coins then issued were the first
had milled edges, the milling having been introduced
r to prevent clipping.

ode in which the silver currency is distributed throughout
dom is explained by the late Mr George Forbes, cashier of
k of England, as follows:

bankers in the Kingdom have a banker who is by agreement in
Every London banker has an account with the Bank of
l. In the Bank of England there is a department devoted
sale and receipt of silver coin. If in a district there is a
y of silver currency, the bankers of the district run the first
t out. They at once write to their London agent, who
their account with the Bank of England and obtains what
required, which they send to the country bankers. On the
nd, if there is a surplus of silver in a district it accumulates
ollers of the local bankers who send it up to their London
and they send it into the Bank of England. If there is a
demand for silver currency, the stock which the Bank of
l endeavours to keep on hand becomes unduly diminished.
mediate notice of the fact is conveyed to the mint authorities,
ceed with all convenient speed to coin a supply of florins,
s, sixpences, or of all of these coins, as the nature of the
may require.

l bullion for coinage is supplied to the mint almost
y by the Bank of England, the bank being bound
to purchase at the rate of £3, 17s. 9d. an ounce
old bullion of the legal standard which the public
ring for sale. Private individuals are permitted to
ullion to the mint, and to receive back the full
t (at £3, 17s. 10½d. an ounce) converted into coin,
any charge for loss or manufacture; but, as they are
to considerable delay, all "importations" of bullion
converted into coin in the order in which they are
t to the mint, the public practically prefer to sell
ullion to the bank, and receive its value without
In order to be accepted by the bank, the bullion
e cast into ingots and assayed, a guarantee being
by certain recognized assayers that the gold is of a
standard fineness. This is known as the "trade
." When the bank requires gold to be struck, due
is sent to the deputy master, and on a fixed day
llion is conveyed to the mint and delivered into his
y. It arrives in the form of ingots, each weighing
about 200 ounces, the aggregate value of each consignment being about £14,000. When the ingots arrive at the mint a small sample is taken from each and assayed, the result being sent to the authorities of the bank in order that it may be compared with that of the bank assay. If the bank authorities find that the two assays agree, within certain limits, as to weight and fineness, the ingots are immediately sent to the operative department of the mint to be converted into coin. The mint assayers use the basis for calculating the amount of copper, the alloy metal, that must be melted with the gold in order to produce the standard prescribed by law. The case of silver is somewhat different, the bullion being purchased by the bank department at its market value, which varies from year to year. During the ten years ending 1881 the average price of silver bullion sank gradually from 60½d. to 52d. per ounce. The silver bullion arrives at the mint in the form of bars, each of which weighs about 1000 ounces, the value of each bar or set of ingots varying considerably. The ingots, both of gold and silver, are weighed on a balance capable of turning with 1 grain when loaded with 1200 ounces.

The operations of coining have undergone some important changes with the introduction of new machinery and the increased extent of the Royal Mint, since the reconstruction of the operative department in 1881.[1] The plan (fig. 1) shows the present arrangement of the operative department.

The operations employed in the manufacture of gold and silver coin are as follow. (Incidental operations are printed in smaller type.)

I. Assaying the bullion.

II. Melting the metal.

(*a*) Addition of the exact amount of copper necessary to the prescribed alloy, by pouring the metal into moulds so as to form bars, and cleaning these bars to remove rough edges and hollow ends, (*b*) recovery of the metal from crucibles and "sweepings."

III. Assaying portions of metal cut from certain bars to ascertain whether sufficient accuracy has been attained in the standard fineness.

IV. Rolling the bars into strips or "fillets."

Annealing the fillets in some cases.

V. Adjusting the fillets by a final rolling and in some cases by the use of the drawbench.

Testing the fillets to ascertain whether they are sufficiently accurate for the coins.

VI. Cutting out discs or blanks from the fillets.

Adjusting the blanks to standard weight in one mint by hand.

VII. Edge rolling the blanks to produce a raised rim, and annealing the blanks and in some cases "blanching" or "pickling" them in dilute acid.

VIII. Coining, or stamping the devices on the blanks by means of engraved steel dies.

Milling the edges of the blanks or in some cases impressing the inscription, or ornament upon them.

IX. Weighing each coin, usually by the aid of automatic machinery.

X. Weighing and weighing pieces taken from the finished coin before it is issued to the public.

The foregoing list will make it clear that the operations of coining consist chiefly in the mechanical production of accurately adjusted disks of metal the purity of

[1] The coins are now annealed in the manner already described, and are washed in Sprengel's Acid Mixture and Gorse.

[2] In order to provide a stock of silver coin about the time of the accession of the present sovereign, when the want of the mint, there was a great demand for coin, and the stock of bronze coin was nearly exhausted, the Act 44 Vict. c. 2 was passed in 1881. The governor of the Bank of England had pointed out that the stock of gold coin held by the bank was also very small, and that no inconvenience would arise if the bank were relieved from coining sovereigns and half-sovereigns for a period of six months or a year or even more.'

[illegible] gold and

Subjoined are the details of the operations involved in the conversion of bullion into coin at the British mint.

After being assayed and weighed in the manner already described the bullion is taken to the melting house, where the details of treatment for silver and gold respectively differ somewhat. (The subsequent operations are nearly identical for both metals.) The silver melting house (see fig. 1) contains eight furnaces, of the kind shown at A in fig. 2, the part of the furnace containing the crucible being below the hole B, B. Crucibles of cast iron were formerly employed, but these were replaced in 1853 by wrought iron pots, which have since 1870 been in turn abandoned in favour of crucibles made of a mixture of clay and graphite, each crucible being capable of containing about 3000 oz. Such crucibles are very generally adopted throughout the Indian and Continental mints, but the form and dimensions given to them vary. The fuel employed in England is coke, about 75 lb of which are required to melt 3000 oz. of standard silver. Sufficient draught is afforded by the flue C and by a chimney about 35 feet high which communicates with it. The silver and copper are melted together

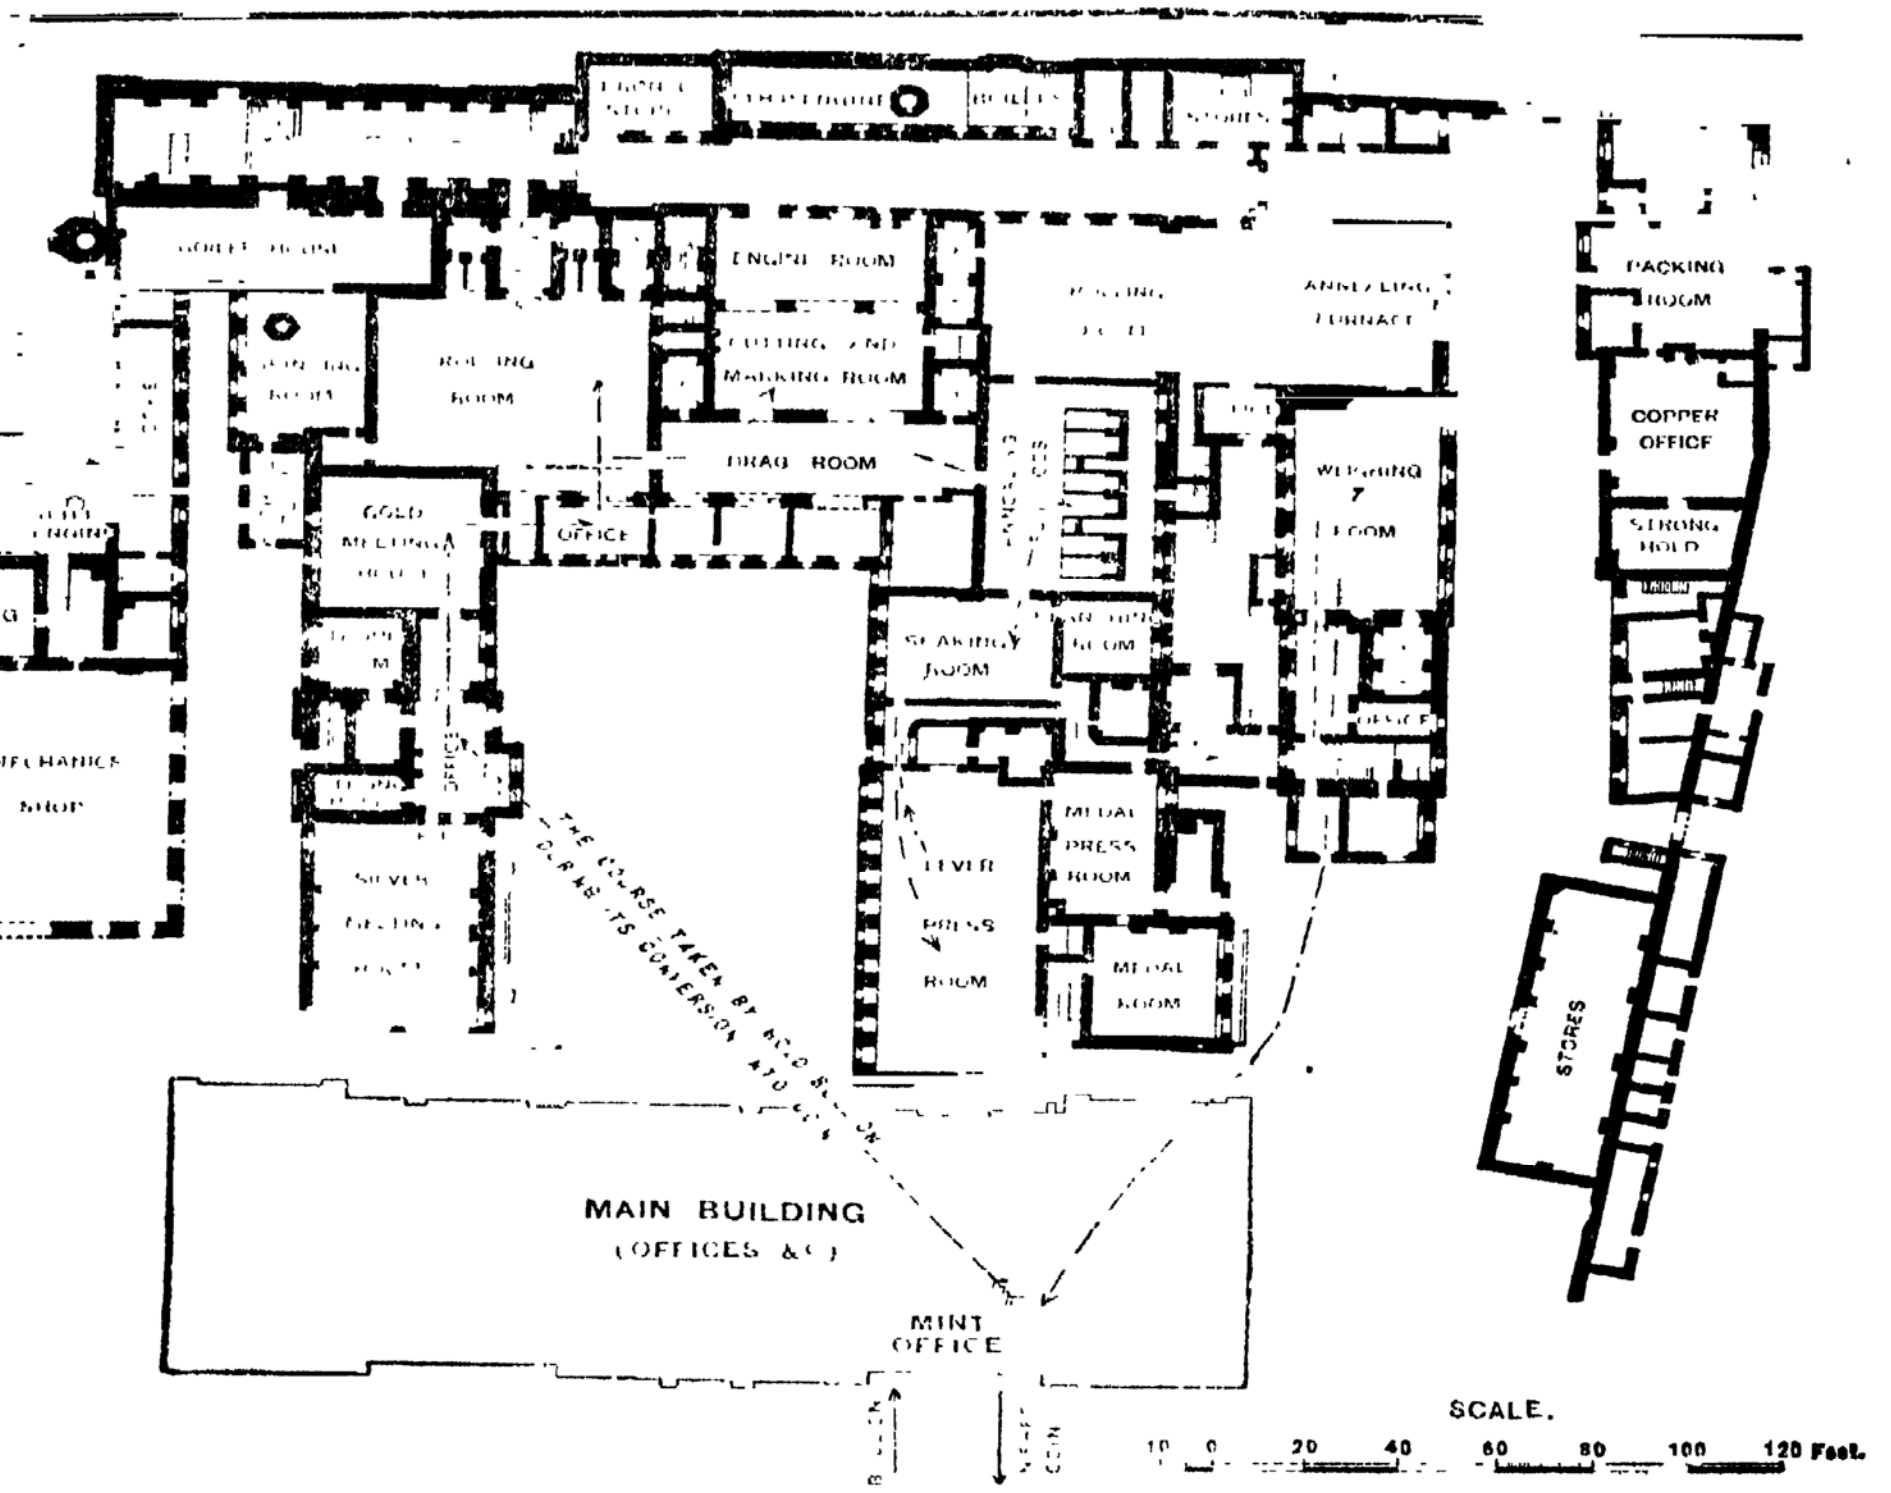

Fig. 1.—Royal Mint, Tower Hill, London. Plan showing the Operative Department as rearranged in 1881–82.

[illegible] poured into moulds it is stirred with an [illegible] end. The surface of the molten metal is [illegible] charcoal to prevent oxidation of the copper [illegible] ot is then removed from the furnace [illegible] tongs W and placed in a cradle M [illegible] by means of a handle D. By the interven- [illegible] G, H, and K acting on a rack the [illegible] the fulcrum formed by a spindle, [illegible] may be poured into the moulds [illegible] running on rail Q, Q. The moulds [illegible] enough to enable bars to [illegible] inches long. The width of the bars according to [illegible] from ¼ to ⅝ inches. [illegible] metal has [illegible] moulds it is removed and [illegible] trimmed by the aid of a revolving circular file, then [illegible] cut off and returned to the melting pot. Portions of [illegible] then cut from each of the ends and sent to the assay [illegible]. The bars are weighed before they pass to the subsequent operations of coinage, in order that the amount of metal remaining in the crucibles or carried into the flue may be ascertained. [illegible] is melted in a similar way, but the crucibles are smaller and contain only 1200 oz. Their contents are poured by hand into moulds, one end of the tongs by which the crucible is grasped being supported by a chain and suspended from the roof. In many Continental mints it is very generally the practice to leave the crucible containing the precious metals in the furnace and to pour the contents into the moulds by the aid of small ladles of wrought iron lined with clay.

It has been pointed out in GOLD (vol. x. p. 751) that minute quantities of certain metals render standard gold extremely brittle and unfit for coinage. If either the gold bullion or the copper used as an alloying metal should be impure, brittle bars will be the result. Should this prove to be the case, the bars are re-

[illegible] A new form of furnace devised by M. A. Piat of Paris has recently been introduced. In these furnaces the portion which contains the crucible may be detached from the flue, so as to admit of the molten metal being poured into moulds without removing the crucible from the incandescent fuel. Four of such furnaces have been fitted up in the gold melting-house, but have not as yet been used for gold melting, in the melting of silver and bronze, however, they are known to effect considerable economy in labour, fuel, and crucibles.

melted and chlorine gas is passed through the molten mass in the manner described in GOLD, vol. x. p. 750.

The engine-room (shown in fig. 1) contains three 60 horse-power vertical condensing engines, which are provided with Corliss valves, and are specially devised for meeting the constantly varying strain to which they are subjected by the machinery, the whole of which they are capable of driving. The central engine acts directly on either or both of the rolling rooms placed on each side of the engine-house. There is, however, an additional 20 horse-power compound beam engine usually employed, in connexion with the pumps of a deep artesian well.

Into one or other of these rooms the bars which have been cast in the melting-house are brought, and are rolled into strips the thickness of which depends on the kind of coins to be produced. Gold is rolled in one room and silver or bronze in the other; the details of manipulation involved in the conversion of gold or bronze bars into coin, however, do not differ materially, and coining of sovereigns will therefore be taken as typical.

Each room contains six pairs of rolls, the diameter of which varies from 10 to 14 inches. Smaller diameters are employed in most European mints, but on the other hand the use of very large rolls of the largest diameter has often been suggested, and there appears to be good ground for the belief that the rigidity of such rolls would enable strips or fillets of more uniform thickness to be

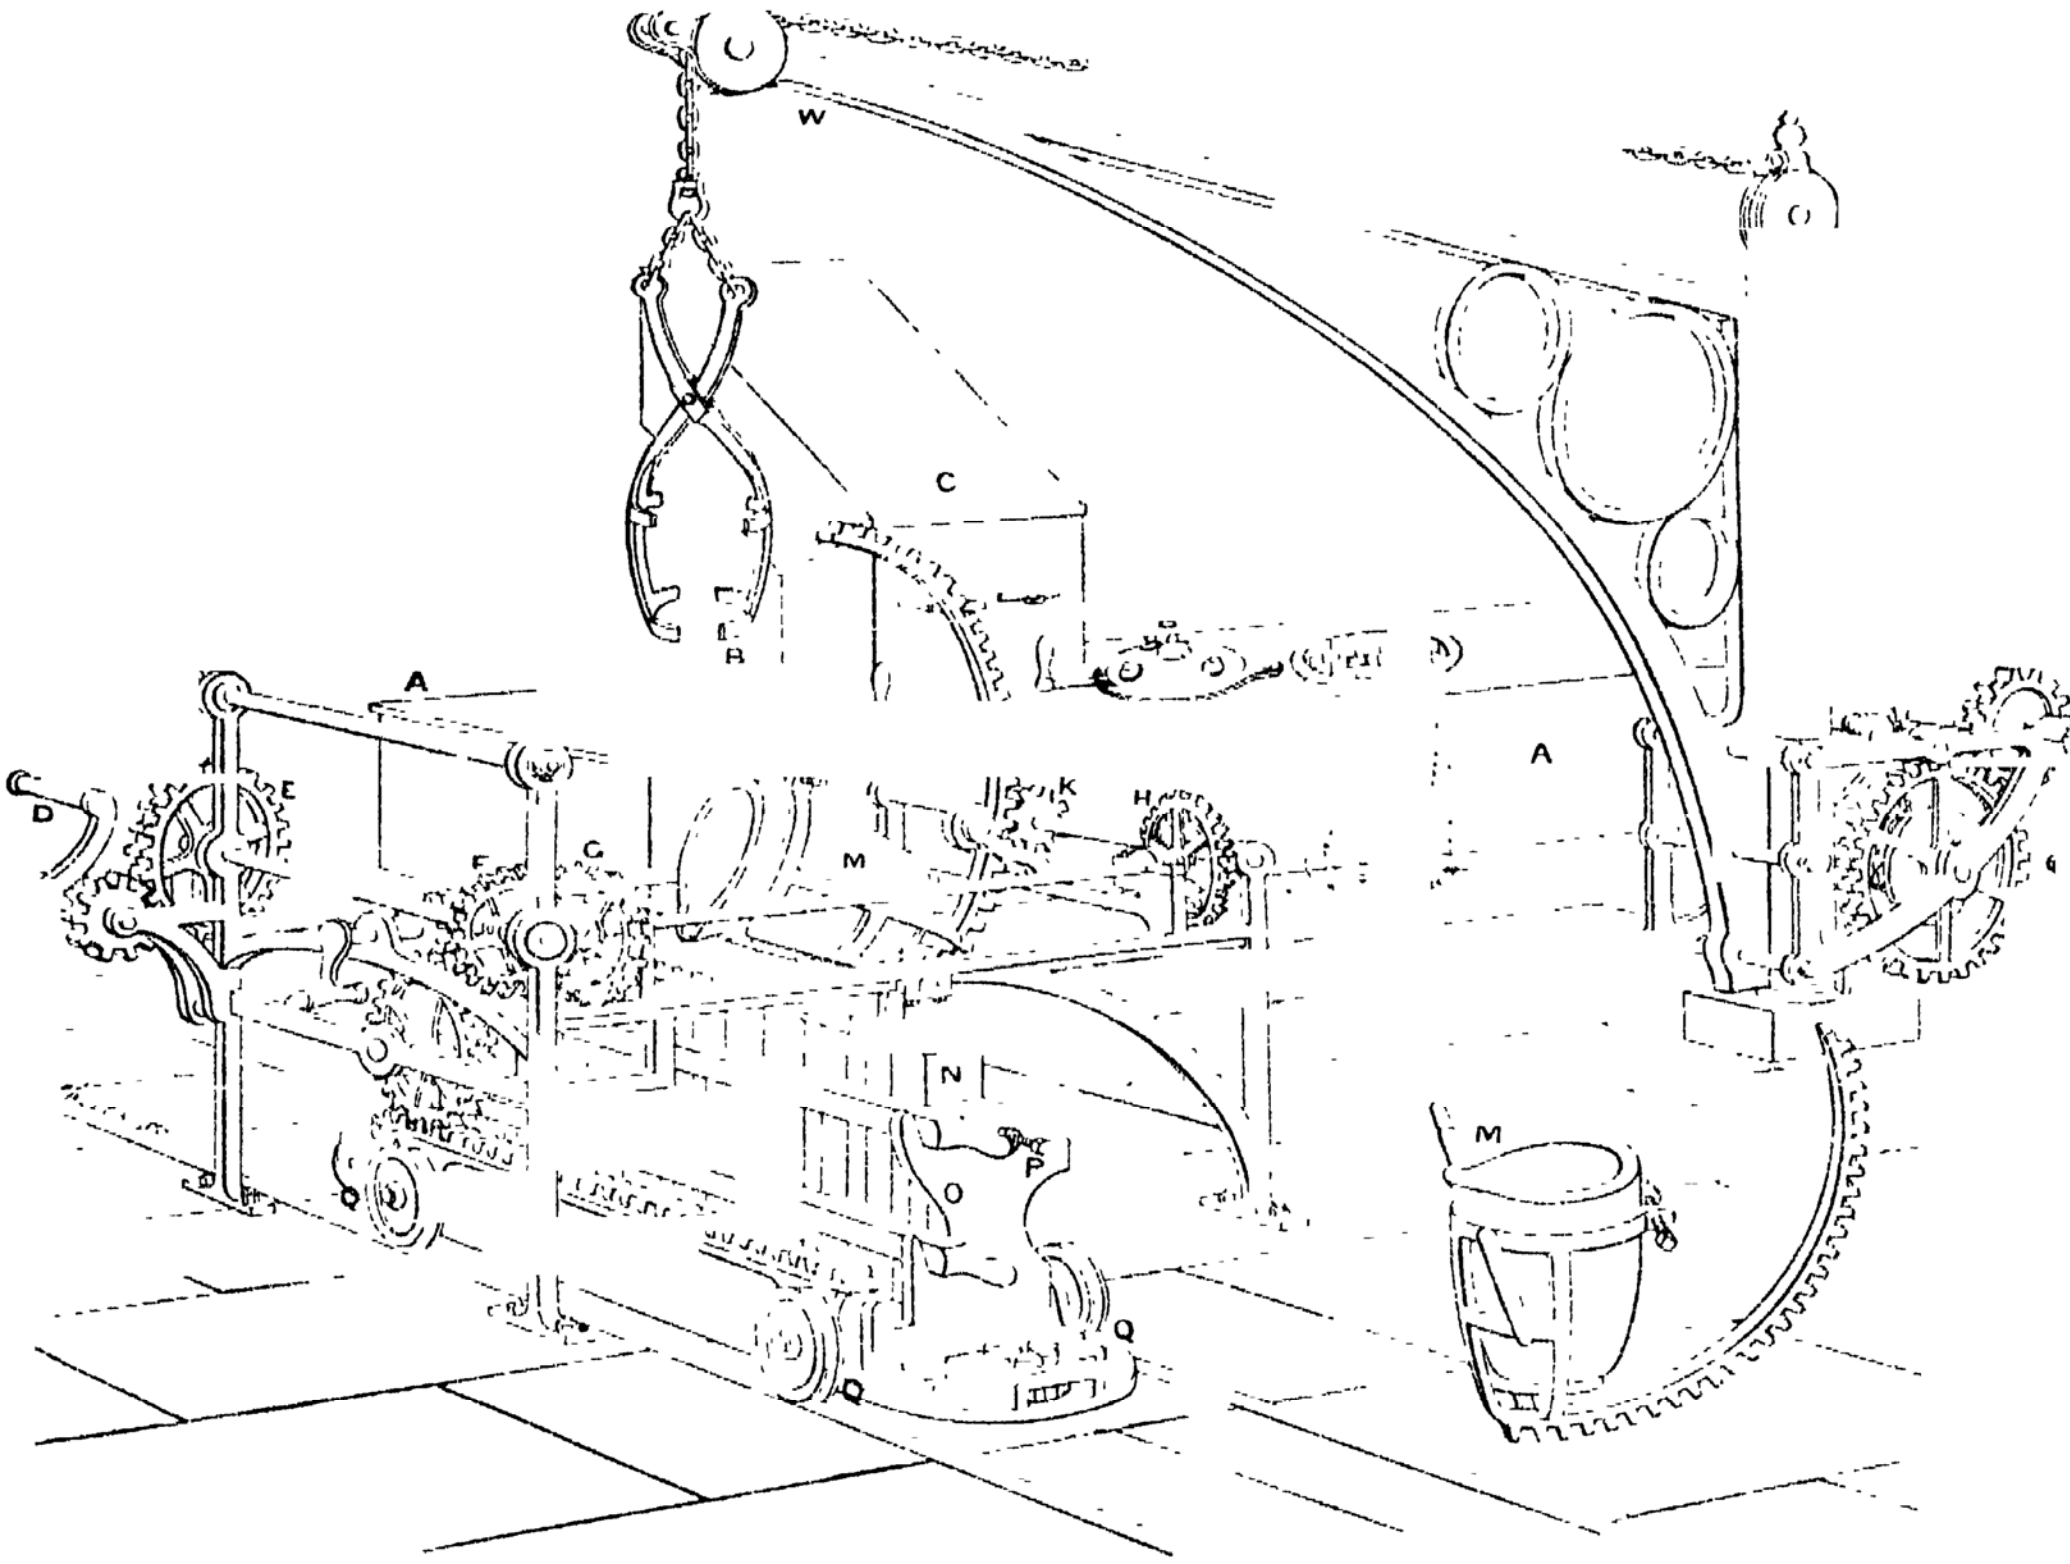

FIG. 2.—Furnace Apparatus.

produced than is the case at present. The iron frame CC (fig. 3) is firmly bolted to the stone D, which rests on a solid foundation EE. This frame supports the two rolls A, B, the lower of which B revolves, but is not, like the upper, capable of adjustment in a vertical plane. The upper roll is centred in bearings, and may be raised or lowered by means of screws connected with toothed wheels F, F, which are turned by a handle G, both wheels being moved simultaneously by worms on the rod H. The bearings of the upper roll are connected by vertical rods with weights below the level of the floor;

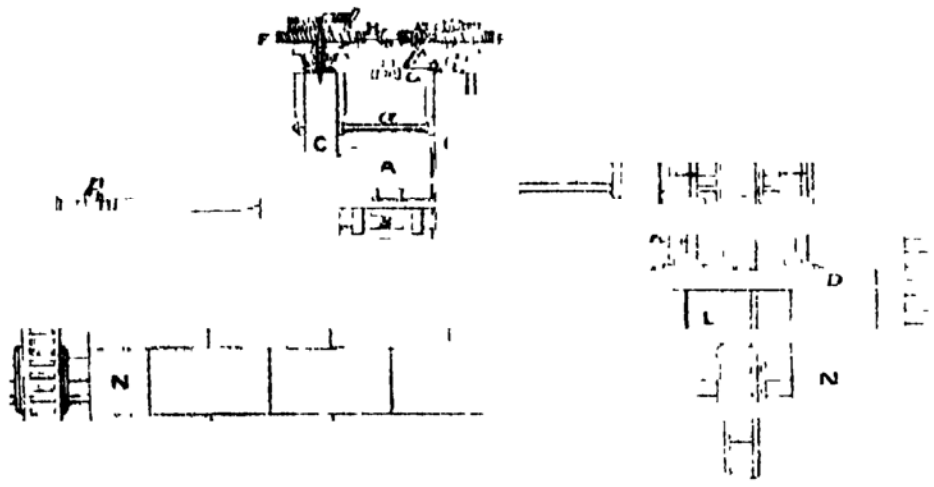

FIG. 3.—Rolls.

and, as it moves with the screws it can thus be readily adjusted to lie exactly parallel with the lower roll, at a distance from it to admit the bar which is to be reduced to a strip. The rolls are turned by the shaft NN, the main wheel and the gearing K, L, O, P. The collets by which the upper roll is connected with the gearing by the shaft I are not rigid, therefore with the shaft Q of the lower roll, but admit of the adjustment of the roll. The portion of the roll used to determine the guide a little wider than the bar. The rolls throughout the department are driven at the rate of about 52 revolutions per minute. The iron frame CC is braced by rods [illegible] and beams the driving gear are shown at [illegible].

The metal [illegible] sovereign bars, the standard weight of which is [illegible] ounces, are annealed in batches of about [illegible] in order to be passed through the rolls under precisely the same condition of adjustment. The bars are only [illegible] with a few repeated passes through the rolls, but are [illegible] reduced by [illegible] on the first stage of the [illegible]

[illegible] are [illegible] shown in the [illegible] are [illegible] the rolls are [illegible] by the pair of [illegible] down roll [illegible] which the fillets are first treated. The upper [illegible] also revolves. The necessary [illegible] is given to the [illegible] introduced, by slightly turning the upper roll by means of a [illegible] lever.

will be evident that the rough classification of the fillets rding to their thickness, to which reference has already been e, renders it easy to compensate for slight irregularities in thick- caused by rolling, by employing cutters of a slightly larger eter than the standard size for fillets which are too thin.

he fillets after the removal of the disks present the perforated arance shown in fig. 9. The residual metal, called "scissel," h amounts to from 25 to 30 per cent of the metal operated upon, turned to the melting house in bundles weighing 180 oz. It be mentioned here that all attempts to cut disks or blanks for age from the ends of rods or cylinders, and thus to avoid the uction of scissel, have hitherto failed.

he next operation to which the blanks are submitted varies in rent mints. In some, each blank is weighed by hand or by matic machinery, and each blank that is too heavy is adjusted r to an exact weight or to within the remedy prescribed by

On the Continent it is very generally the practice to adjust ks by the aid of a file, or by a machine that removes a fine ing of metal from the surface of the blank. In mints where hanical adjustment is adopted there is a tendency to produce o heavy" blanks in the rolling and cutting departments, as it is ossible to adjust blanks which are too light.[1]

In the London mint finished coin alone is weighed, so that t blanks after leaving the cutting room pass directly to an edge-rollin machine, which thickens the edge of each blank so as to form a ri intended to protect the impression on the finished coin. T operation of edge-rolling is called "marking," and the method conducting it varies considerably in different mints.

In the Royal Mint the blanks are made to pass in quick succe sion, at the rate of six hundred a minute, between a circular groo in the face of a revolving steel disk and a groove in a fixed blo placed parallel to the face of the revolving disk. The groove the block exactly corresponds to that on the disk; and, as t distance between the block and the disk is slightly less th the diameter of the blank submitted to the operation, the result that before the blank escapes from the machine its edge has be thickened. The operation may be varied by admitting the blan between a groove in the periphery of a revolving wheel and a groo in a segmented block, placed at a distance from the wheel rath less than the diameter of the blank. The wheel and block may either vertical or horizontal.

In some cases the edges of the blanks, at the same time that th are thickened, receive the impression of a legend, or inscription, an ornamental device. When this is the case the blank is roll

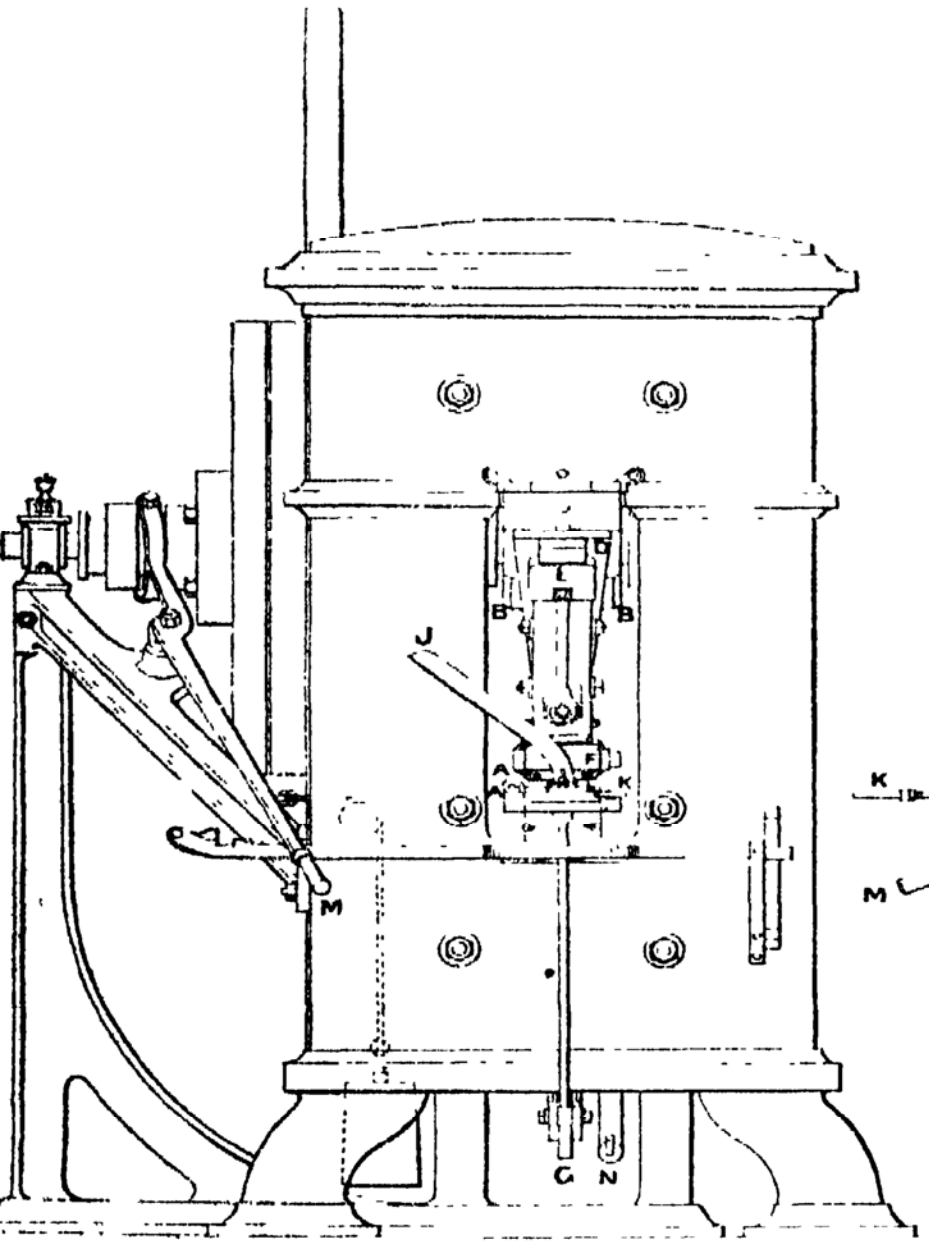

Fig. 10.

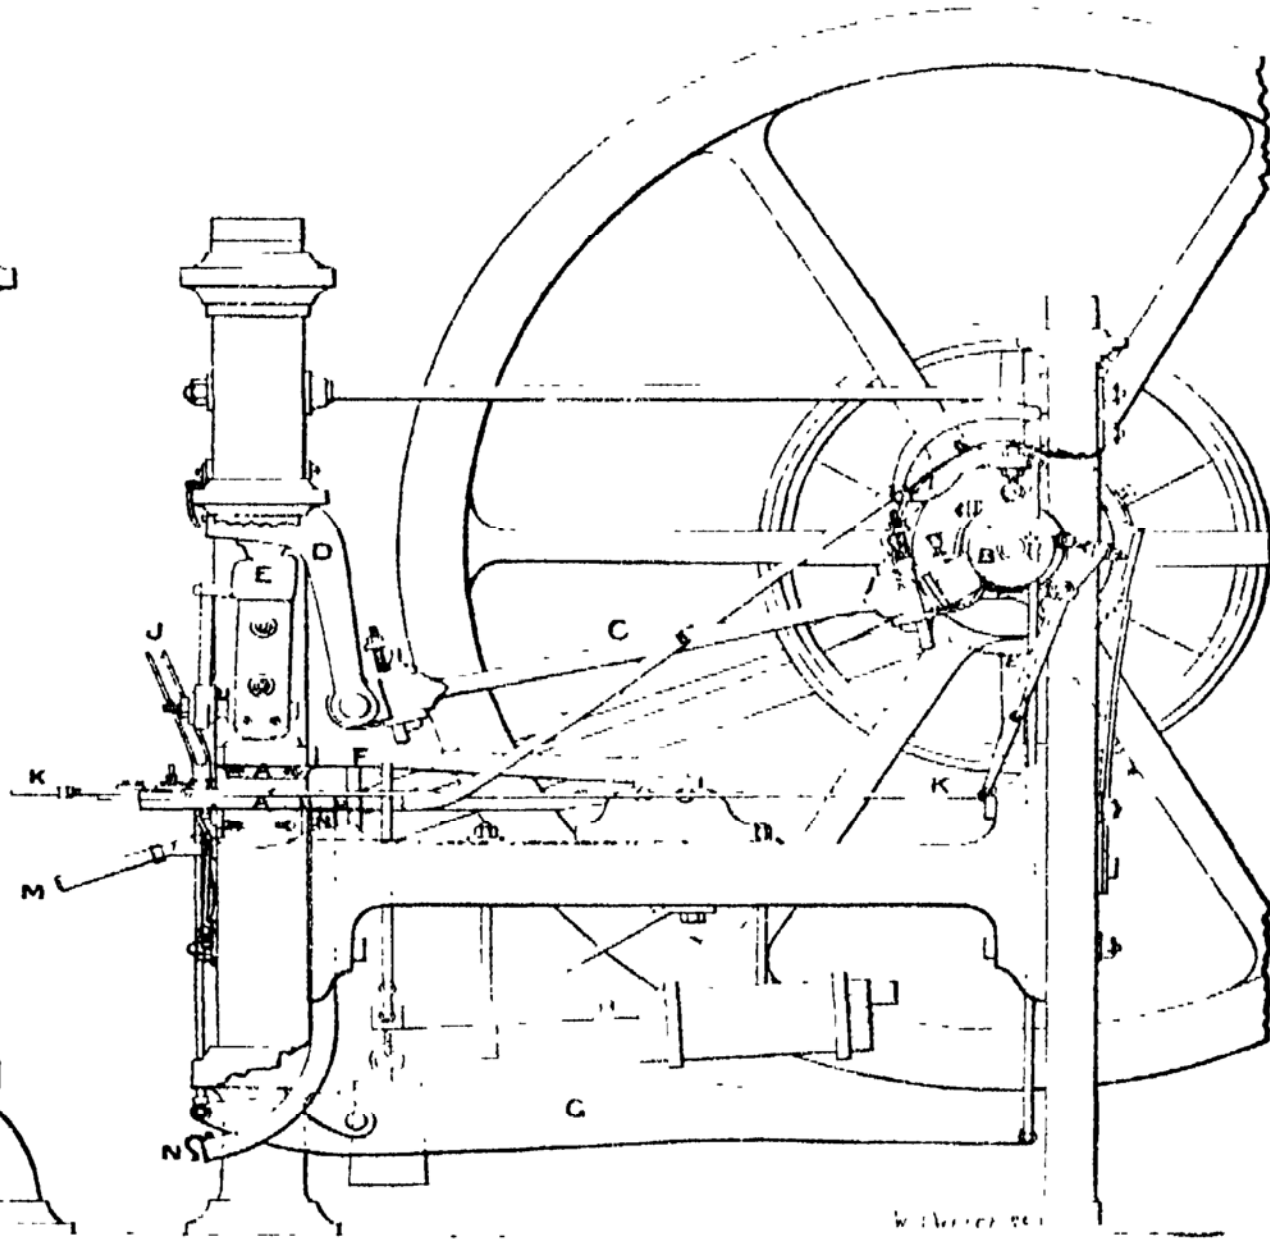

Fig. 11.

een two planes, one of which is fixed and bears
e the other has a reciprocating motion imparted to it, or the
of the blank receives the impression, which may be either raised or sunk, from a collar surrounding the blank in the coining press, will be afterwards explained.

Before passing to the coining press the blanks either of gold silver are annealed. In many mints the object of the heating not only to soften the blanks before they receive the impression, b also to produce a film of oxide of copper on their surface. This attained in various ways. In England gold blanks are placed cylindrical crucibles of plumbago and covered with a layer of ch coal heated in a reverberatory furnace, and when the blanks re cherry red they are cooled by plunging them in water. T thin film of oxide of copper thus formed on the surface of the g or silver blanks is readily soluble in dilute sulphuric acid, and t removal of a small portion of the alloying metal in this way co stitutes "blanching" or "pickling" the coin. The method conducting the operation varies somewhat in different mint mainly, however, in the strength of the acid used, which varies fr 3 to 5 of the hydrometer of Baumé. The solution is sometim heated to 96° to 98° C., while in other cases the blanks are int duced into the solution while at a red heat. The latter method however, objectionable, as a dense layer of pure metal is found at t surface of the blank which is apt to protect the underlying oxide copper from the action of the acid. The blanks are afterwa washed in pure water and dried either in sawdust or in copp vessels heated by steam jackets. The object of the process is

[1] A description of a machine used for the adjustment of blanks will be found in *Dingler's Polytechnisches Journal* (1882, ccxlv. 61, pl. 6), and some years ago J. M. Napier devised for the Indian mints a beautiful machine which first obtains how much it is necessary to cut from each blank in order to reduce it to standard weight, and then removes the necessary amount of metal and more. The initial cost of such machinery, however, is considerable. In 1849 Mereck, director of the mint in Paris, endeavoured to substitute a chemical or mechanical treatment by submitting the heavy gold blanks to aqua regia which it was anticipated would bring them within the prescribed limits of accuracy. The results were not satisfactory, and the attempt was abandoned. In 1870 the present chemist of the mint, Professor W. Chandler Roberts, showed that gold alloyed with copper might be removed from heavy blanks with singular regularity by means of a suitable solvent aided by a battery. The blanks are arranged in a frame of wood and submitted to the action of a solution of cyanide of potassium, the heavy blanks forming the dissolving pole of the battery. The process was not used in the London mint, as it became evident that it could not favourably replace the present system, under which finished coins alone are weighed and the manufacture of good coin only is paid for. It was, however, introduced into the Bombay mint in 1870 by the late Mr L. G. Hines, who increased its usefulness by transferring the metal dissolved from the heavy blanks to blanks which are too light, the latter being by this means raised to the prescribed weight. The process has now fairly taken its place as an ordinary operation of coining, and its importance to the mints where it is used may be judged from the fact that in the Indian mints no less than 1300 tons of silver are converted into coin in one year (1879), so that the saving effected by its use must be considerable.

improve the appearance of the finished coin by removing all traces of impurity from the surface of the blank. It has, however, been abandoned in the British mint except in the case of some of the smaller silver coins, mainly because the soft superficial layer of metal wears away with undue rapidity. Certain precautions suggested in 1869 by Mr Hill, the superintendent of the operative department, for avoiding oxidation or tarnishing of the metal during coinage rendered the abolition of the process possible.

The blanks receive the impression which constitutes them coins from one of the dies. Each is placed in the lower of two dies, and the upper brought forcibly down upon it. The lateral escape of the metal prevented by a collar which surrounds the blank while being struck. This collar may be either plain or of it the latter is the case any device or ornament it be imparted to the edge of the blank.

The presses used in various mints may be divided into three the screw press worked by atmospheric pressure, the eccentric press, and the lever press. The first of these (see *Engineering*, 8th ed., vol. xvii. p. 92) has now been abandoned. In the eccentric press the power is applied to a shaft bearing an eccentric which acts by means of a connecting rod upon a vertical shaft bearing the die which has brought down on the blank. This form of press is used in the mint at Constantinople where the atmospheric screw press is also still retained. Of the third type, the lever press, there are two modifications, devised respectively by Thonnelier and by Uhlhorn. The details of the Uhlhorn press have been improved by Messrs R. Heaton & Sons of Birmingham, and, their superiority to the old vacuum screw press having been demonstrated by careful experiment, they have been finally adopted in the newly arranged mint which contains fourteen of them. This press is shown in figs. 10 and 11. It is driven from below the floor of the press-room by bands which pass over fast and loose pulleys on the same shaft that bears the fly wheel. The loose pulley, however, is only used when it is necessary to stop the machine entirely, as the fly wheel is permitted to revolve without imparting motion to the shaft. A lever M, worked from the front of the machine, does cause the fly wheel to be connected with the driving wheel by means of two pins. The dies are placed in the front part of the machine, fig. 10. The lower one is firmly fixed to the bed, while the upper is held at A by the upper of two jaws F and A', or levers, the fulcra of which are so close together as almost to coincide, the lower jaw A' bearing the collar which encircles the blank while it is being converted into a coin, the upper jaw F, V, governed by the weighted lever H shown below the bed of the machine, has a tendency to rise a sufficient distance to admit the blank between the upper and lower dies. A crank B on the shaft bearing the fly wheel is connected by a rod C with the bent lever D, and this bent lever, acting through the toggle joint and a piece of metal E connected with the jaw that bears the

Fig. 12.

upper and lower of the two lower jaw to be depressed on the lower die, to next blank in position 60 to 120 a minute blanks to be converted advance of each blank the "driver on" by the backward and forward movement of which is also regulated by an eccentric on the crank shaft. The details of this part of the machine are shown in plan, fig. 12.

and thus squeezes the blank between the V-cam on the crank shaft acting on the shown below the bed of the machine causes the collar which surrounded the blank to leave the finished coin freely resting once it is driven down the shoot N by the Coins are produced at rates varying from a minute giving the best results. The coins are placed on the slide J, and the coin is regulated by the rod called

The last operation before the finished coin is returned to the mint office for issue to the public is the weighing each gold or silver piece separately. This is effected in the American and in most Continental mints by hand, but in England automatic balances of construction are employed. They were originally dev separating worn pieces from those of current weight, but they employed to distinguish between "light," "heavy," and pieces, the latter alone being permitted to pass into circula the newly arranged department thirty such machines are Each is driven from overhead shafting by means of gut li driving pulleys derive their motion from a small atm engine, which is found to give more satisfactory results tha be the case if the steam-engine were employed directly balance is worked by a cone pulley A (fig. 13) by a passing round it from the loose pulleys B, the necess sion being imparted to the line by means of a spring tension of the line is, however, but slight, for if the the balance is arrested by accident the cord slides over pulley A without turning it. It will be obvious that t the cone pulley enables the machine to be driven with degrees of speed. The toothed wheel D is mounted on the which bears the driving pulley A, but it acts only thr intervention of a friction wheel, which is so lightly screwe the driving wheel that it would cease to act if the machin be accidentally detained. The wheel D sets in motion th E, E', E''. The cam E, acting on the curved extremity of the frame G, causes the lever H to bring forward one of a serie arranged in the hopper I until it rests on the plate J of th beam, of which beam a portion is shown in an enlarged above the balance, while the plate that receives the coin is al in a separate drawing to the left of the machine. Anothe then comes into play, and enables the forceps, shown at L, the rod M to which the balance plate J is attached. The serves to keep the rod steady while the coin is being place plate J. A rod shown at N is then raised by the cam O, extremity of the rod being kept steady by a pin sliding in the bottom plate of the balance and its upper end by a p works into the central support of the balance beam. At of this rod N, and at right angles to it, there is a metallic the ends of which pass through stirrups in the pendants from the opposite ends of the beam. The elevation of this tal rod by the cam O simultaneously releases both ends of t and the coin placed on the beam plate has then, for the f a direct influence on the beam. If the coin is "too li counterpoise R in the cage at the end of the rod P will coin, and the revolution of the machine then causes part o K to permit a spring to close the forceps L and to hold the M firm. An indicating finger T then falls, and by me horizontal lever UU', which fits into one of three inverted the bottom of the shoot V, determines over which of thr W, W', W'' in the bottom plate of the balance this shoot sh In the meantime the advance of the slide H brings the n forward, and displaces the coin which has hitherto oce beam plate J, forcing the coin down the shoot V, and thence the orifice W into a receptacle external to the balance, de the reception of "light coin." If this next piece should heavy" it will not only raise the counterpoise R but will al a little wire S, which would otherwise remain undistu support. This little wire represents the "working rem the particular denomination of coin in question, which, f is less by $\frac{1}{100}$th of a grain than the remedy permitted by l undue weight of the "heavy coin" will depress the right balance beam and its pendant M to the lowest possible p the indicating finger T will, in this case, determine tha UU' shall occupy the lowest step of the shoot V, which w quently stand over the orifice W'' in the bottom plate of th which communicates with the receptacle for the "heavy and the heavy coin on the beam plate will be driven shoot by the next coin in succession. If the coin which brought forward by the slide H should be a "good" one it is within the working "remedy," its action will be a It may be slightly heavier than the counterpoise, but not su heavy to lift both the counterpoise and the remedy w balance beam consequently remains approximately horizo the indicating finger T will cause the rod UU' to strike t step of the shoot V, which will then stand over the central in the bed plate which communicates with a receptacle for coins, into which the coin will find its way, as soon as it from the beam plate by the next coin of the series. I evident that this excellent appliance both weighs and cla coin. About twenty-three coins are passed through it in

In order to show the importance of extreme accuracy in it may be pointed out that, although by the Coinage Act of "remedy" or allowed variation above or below the standa of a sovereign is only $\frac{1}{4}$th of a grain, yet in a million s sovereigns the difference between the least and the greate the law allows would be no less than £3244.

The manufacture of coin is not the only work performed in the Royal Mint. All medals issued

and navy, as well as those given by the Royal and the university of London and some others, uck in the mint, and their preparation forms a rable part of the work of the die department. 874 the clasps and bars for the medals have also anufactured in the mint, whence they have been completely mounted. Another operation, not with the coinage, which is performed in the mint is the assay of the "diet" or metal scraped from t and silver plate manufactured at Sheffield and Birmi under the direction of the warden of the stan wrought plate for those towns. By Act of Parlia is directed that this shall be brought once in each the mint to be assayed by the "king's assay m under the supervision of an officer appointed by th of the Treasury.

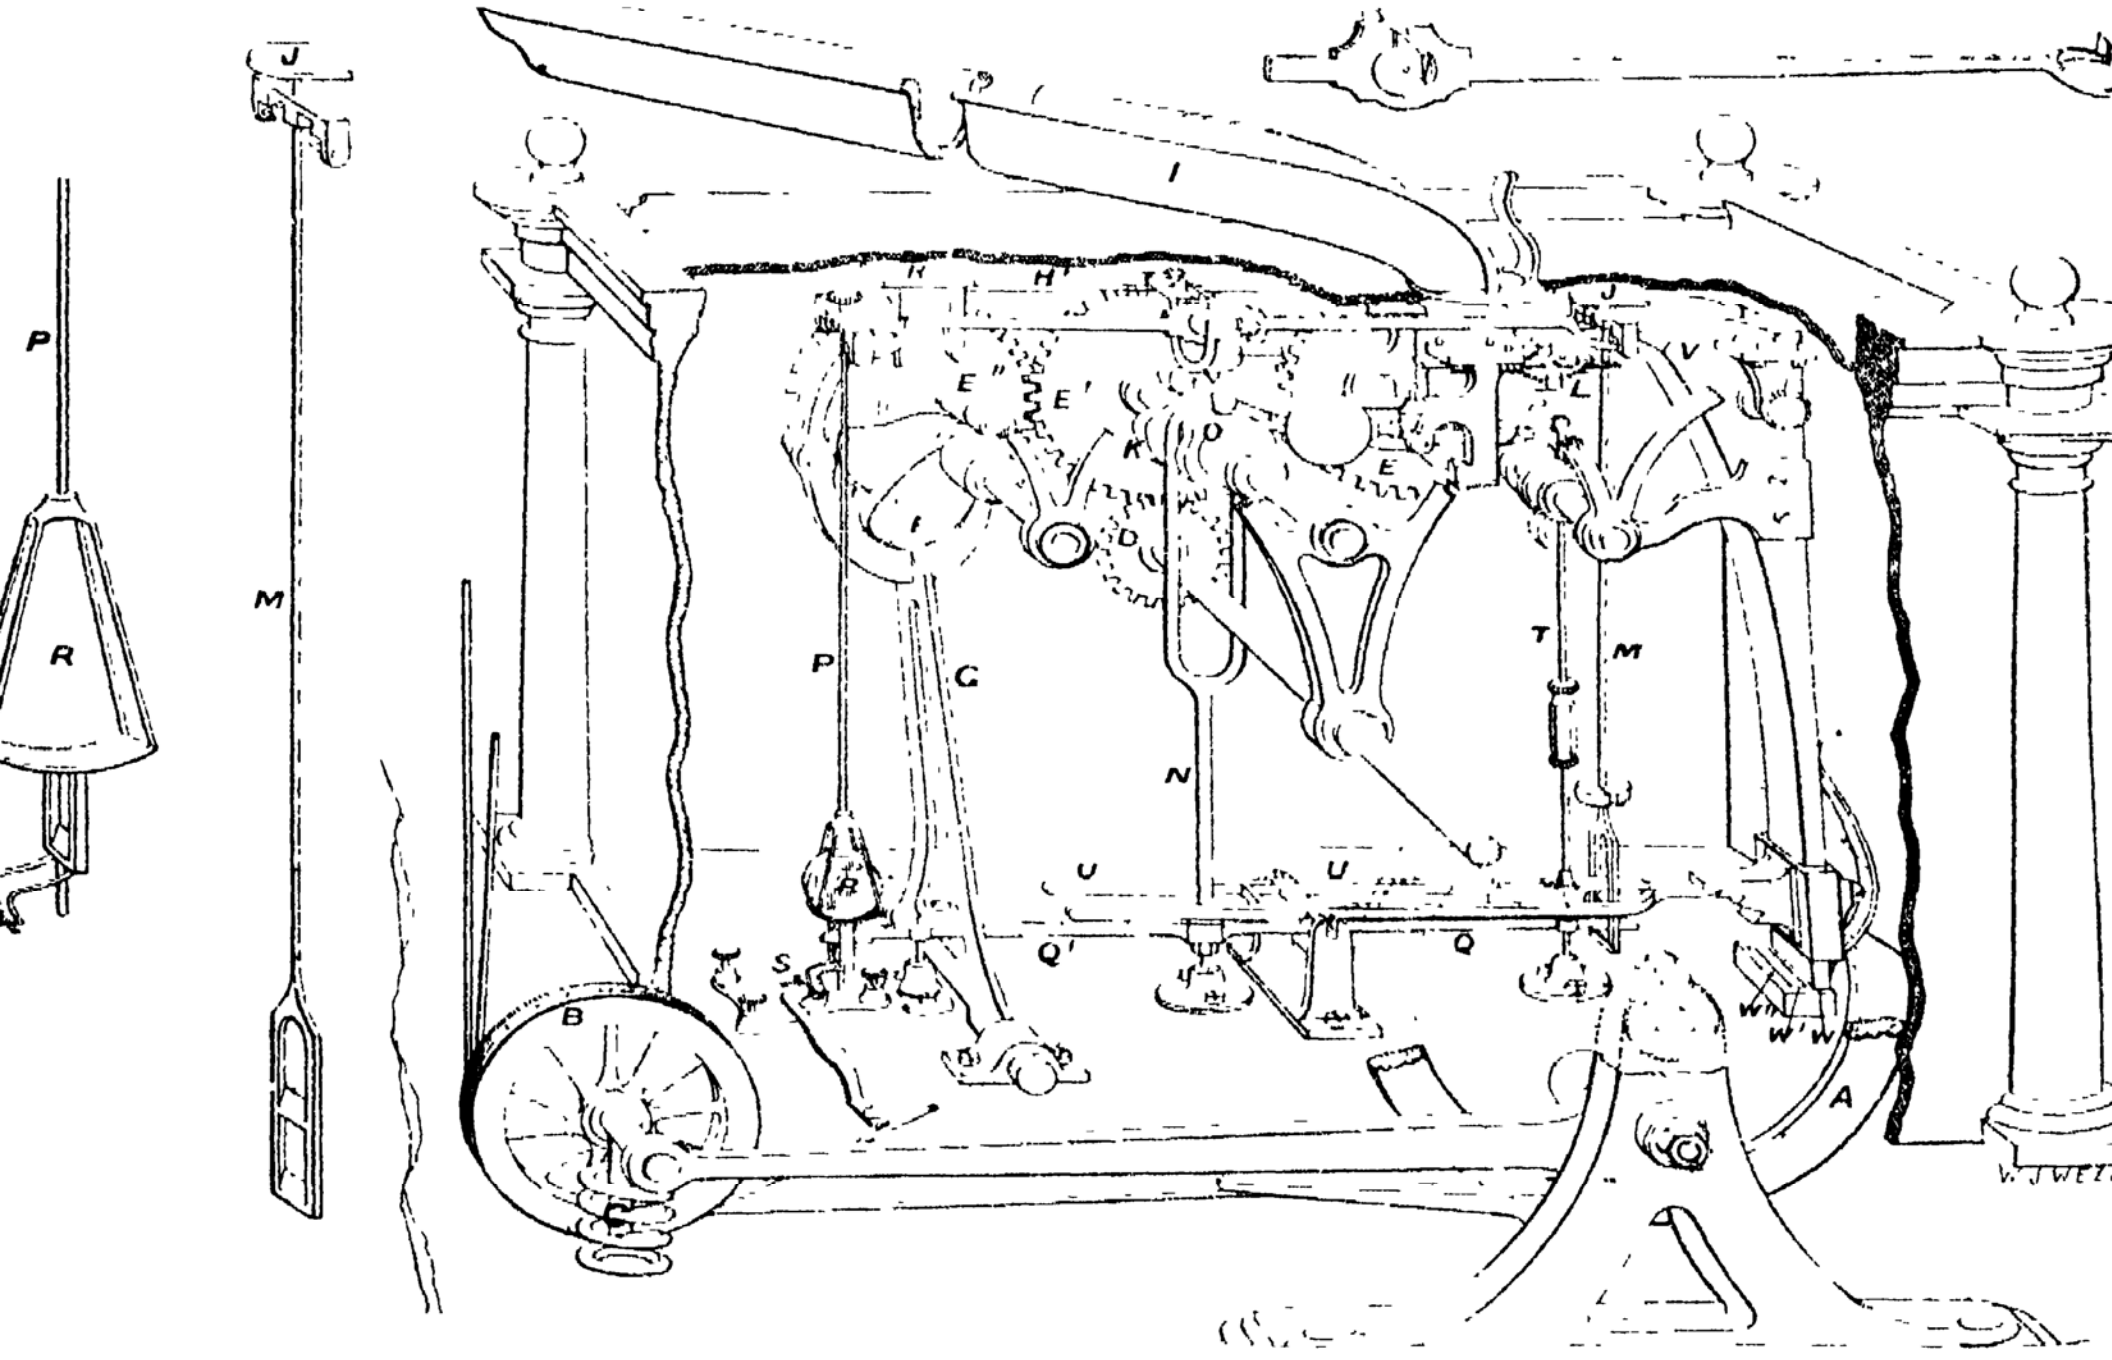

FIG. 13.—Automatic Balance.

gold coin in circulation in Great Britain is esti- at £100,000,000. It may be well to add the ng table, which gives the value of the gold and coinages of four of the most important foreign es, in two recent years :

value of the gold coinage of the American mints the fiscal year ending June 1882 amounted to 3,447·50, being greater than that of any previous their history. (W. C. R.—R. A. H.)

T, botanically *Mentha*, a genus of labiate plants, sing about twenty species of perennial herbs, widely ted throughout the temperate and sub-tropical s of the globe. All the species are furnished with stems, opposite, aromatic leaves, and creeping roots. wers are arranged in axillary cymes, which either parate whorls or are crowded together into a terminal The corolla is usually small, and of a pale purple or pinkish colour; it has four nearly equal lobes, and two long and two short stamens. Great diffic experienced by botanists in discriminating the sp this genus by reason of the occurrence of a large of intermediate forms, nearly three hundred of whi been named and described. Many of these variet permanent in consequence of being propagated by s

In Britain nine of the recognized species are i ous. *Mentha viridis*, L., or Spearmint, grows in meadows, and is the species commonly used for c purposes; it is distinguished by its smooth, sessile and lax tapering flower-spikes. *Mentha sylvestris* Horsemint, chiefly differs from the above in its habit and hairy leaves, which are silky beneath, an denser flower spikes. This plant is supposed to be t of Scripture, as it is extensively cultivated in the E is much used in cookery: it was one of the bitte with which the paschal lamb was eaten. *M. rotu* resembles the last in size and habit, but is readily guished by its rounded wrinkled leaves, which are beneath, and by its lanceolate bracts. The last two usually grow on damp waste ground near roadside *aquatica*, or Capitate Mint, grows in ditches and side of streams, and is easily recognized by its r flower-spikes and stalked hairy leaves. *M. Pipe* Peppermint, has stalked smooth leaves and an obtuse terminal spike of flowers; it is extensively

or its volatile oil. *M. pratensis* belongs to a group
ts which, unlike the foregoing, have the flowers
ed in axillary whorls and never in terminal spikes;
rwise bears some resemblance in foliage and habit
viridis. *M. sativa*, the Whorled Hairy Mint, grows
mp road-sides and *M. arvensis* in cornfields: they
tinguished from *M. pratensis* by their hairy stalked
which in *M. arvensis* are all equally large, but in
ter are much smaller toward the apex of the stem.
Pulegium, commonly known as Pennyroyal, more rarely
mint, has small oval obtuse leaves and flowers in
whorls, and is remarkable for its creeping habit
cular odour. It differs from all the mints above
ed in the throat of the calyx being closed with hairs.
t with in damp places on grassy commons, and forms
known domestic remedy for female disorders.
he plants of the genus *Mentha* abound in a volatile
ich is contained in small receptacles having the
ance of resinous dots in the leaves and stems. The
f the oil is similar in several species, but is not dis-
, the same odour occurring in varieties of distinct
while plants which cannot be distinguished by any
al character possess the same odour. Thus the
nint flavour is found in *M. Piperita*, in *M. incana*,
Chinese and Japanese varieties of *M. arvensis*. Other
f the last named species growing in Ceylon and Java
e flavour of the common garden mint, *M. crispa*,
e same odour is found to a greater or less degree
sylvestris, *M. rotundifolia*, and *M. canadensis*. A
ot scent is met with in a variety of *M. aquatica* and
s of other species. Most of the mints may be found
som in August.
name mint is also applied to plants of other genera,
la punctata being called Horsemint, *Pycnanthemum*
um, Mountain Mint, and *Nepeta Cataria*, Catmint.

TO, Sir Gilbert Elliot, First Earl of (1751
was descended from an old border family, the
of Minto, and was born at Edinburgh, April 23,
His father, Sir Gilbert Elliot, was a member of the
stration of Pitt and Grenville, and is spoken of by
Walpole as "one of the ablest men in the House of
ons." Young Elliot was educated by a private tutor,
hom at the age of twelve he went to Paris, where
Hume, who was then secretary of the embassy,
ook, from friendship to his father, the special charge
rintending his studies. After spending the winters
5 and 1767 at Edinburgh University, Elliot entered
. On quitting the university he became a member
oln's Inn, and was in 1771 called to the bar. He
parliament in 1776, the year of his father's death,
eh he gave a general support to Lord North's
tration, he from the beginning occupied an inde-
t position, and in 1782 supported the address of the
on to carry on an offensive war with America. From
me he became a declared follower of Fox and
with the latter of whom he gradually came to be
ns of the closest intimacy. He was created Baron Minto
7, and after filling several diplomatic posts with great
became in 1807 governor-general of India. The
ter and events of his rule in India are described
xii. p. 805). He was created Earl of Minto and
nt Melgund in 1813. He returned to England in
and died on June 21 of that year.

Life and Letters of Sir Gilbert Elliot, first Earl of Minto,
1 to 1806, 1874, and *Life and Letters*, 1807–14, 1880. See
RABEAU.

UCIUS FELIX, Marcus, one of the earliest, if not
liest, of the Latin apologists for Christianity. Of
sonal history nothing is known, and even the date
h he wrote can be only approximately ascertained.
Jerome (*De Vir. Ill.*, 58) speaks of him as "
insignis causidicus," but in this he is probabl
improving on the expression of Lactantius (*Inst. Di*
who speaks of him as "non ignobilis inter causidico
He is now exclusively known by his *Octavius*, a d
on Christianity between the pagan Cæcilius Natal
the Christian Octavius Januarius, a provincial s
the friend and fellow-student of the author. The
pleasantly and graphically laid on the beach at Ost
holiday afternoon, and the discussion is represe
arising out of the homage paid by Cæcilius, in pas
the image of Serapis. His arguments for paganism
proceed partly upon agnostic grounds, partly up
inexpediency of disturbing long-established religious
partly upon the known want of culture in Christia
alleged indecency of their worship, and the i
absurdity of their doctrines, are taken up seria
Octavius, with the result that the assailant is con
postponing, however, the discussion of some things
sary for perfect instruction to a future occasion. T
of the dialogue, modelled on the *De Natura Deor*
De Divinatione of Cicero, shows much care and abili
its style is on the whole both vigorous and elega
times not exempt from something of the affectation
age. If the doctrines of the Divine unity, the resur
and future rewards and punishments be left out of a
the work has less the character of an exposi
Christianity than of a philosophical and ethical
against the absurdities of crass polytheism. Chri
and the other metaphysics of distinctively C
theology are entirely passed over, and the ca
Scriptures are not quoted, hardly even alluded to.

The *Octavius* is admittedly earlier than Cyprian's *De*
Vanitate, which borrows from it; how much earlier can
mined only by settling the relation in which it stands to Ter
Apologeticum. The argument for the priority of Minu
been most exhaustively set forth by Ebert ("Tertullians
niss zu Minucius Felix" in vol. v. of the philologico-h
series in *Abhandl. d. Königl. Sachs. Gesellsch. der Wissen*
1868), who has been followed by Teuffel (*Röm. Lit.*, sec. 36
Celsus' Wahres Wort, 1873), Kuhn, and other scholar
opposite view is ably maintained by Professor Salmon ("M
Felix" in Smith's *Dict. Christ. Biogr.*, 1882). The *Octa*
first printed (Rome, 1543) as the eighth book of Arnobi
Gentes, Baldinus (Heidelberg, 1560) first assigned it to it
author. There have been numerous subsequent editions,
being that of Halm in the *Corp. Scriptor. Eccl. Lat.* (Vienn
See Kuhn's monograph, *Der Octavius des Minucius Felix* (

MINUET (Fr. *Menuet*, from [*pas*] *menus*), a very
ful kind of dance, consisting of a coupee, a high st
a balance. Its invention is universally ascribed
inhabitants of Poitou. The melody begins with th
beat, and contains three crotchets in a bar. The m
made up of two strains, which, from being repea
called *reposes*, each consisting of eight or more ba
very rarely of an odd number. Walther speaks of a
in Lully's opera of *Roland*, each strain of which c
ten bars, the sectional number being five,—a circum
which renders it very difficult to be danced; but
system of phrasing was remarkably irregular.
instrumental composers have introduced into the
phonies and quartetts, &c., minuets of rapid mo
and tuneful character, followed by supplementary
(called trios) in a different style. Some of these c
tions bear but very slight resemblance to the older
and many of them begin with the third beat in t
The finest minuets we possess are those in Handel's
and Mozart's *Don Giovanni*.

MIRABEAU, Honoré Gabriel Riqueti, Com
(1749–1791), one of the greatest statesmen and

[1] This name occurs in six inscriptions of the years 211–217
Constantine (Cirta), North Africa (*C. I. L.*, vol. viii.).

has ever produced, was born at Bignon, near
rs, on March 9, 1749. M. de Loménie has shown
e family of Riquet or Riqueti came originally from the
own of Digne, that they won wealth and municipal
s as merchants at Marseilles, and that in 1570 Jean
i bought the chateau and estate of Mirabeau, which
to that time belonged to the great Provençal family
as, and took the title of esquire a few years later.
5 Honoré Riqueti obtained the title of Marquis de
au, and his son Jean Antoine brought honour to it.
ved with distinction through all the later campaigns
reign of Louis XIV., and especially distinguished
in 1705 at the battle of Cassano, where he was so
y wounded in the neck that he had ever after to wear
stock; yet he never rose above the rank of colonel,
to his eccentric habit of speaking unpleasant truths
superiors. On retiring from the service he married
ise de Castellane, a remarkable woman who long
d him, and he left at his death, in 1737, three sons
or, Marquis de Mirabeau (see next article), Jean
e, Bailli de Mirabeau, and Comte Louis Alexandre de
au. The great Mirabeau was the elder surviving
the marquis. When but three years old he had
lent attack of confluent small pox which left his
r ever disfigured, and contributed not a little to
his father's dislike to him. His early education
onducted by Lachabeaussière, father of the better
man of letters, after which, being like his father
randfather destined for the army, then the only
ion open to young men of family, he was entered
nsion militaire at Paris, kept by Abbé Choquart
s school, which had Lagrange for its professor of
natics, we have an amusing account in the life of
Elliot, first earl of Minto, who with his brother
afterwards British minister at Berlin, there made
quaintance of Mirabeau, an acquaintance which
ipened into friendship, and to which Mirabeau in
fe owed his introduction into good English society.
ving this school in 1767 he received a commission
cavalry regiment of the Marquis de Lambert, which
ndfather had commanded years before. He at once
love making, and in spite of his ugliness succeeded
ning the heart of the lady to whom his colonel was
d, which led to such scandal that his father obtained
e de cachet, and the young scapegrace was imprisoned
isle of Rhé. The love affairs of Mirabeau form
a history by themselves, and a well known history,
to the celebrity of the letters to Sophie; and the
our of the marquis in perpetually imprisoning his
equally well known, and as widely blamed. Yet it
e asserted that until the more durable and more
ble connexion with Madame de Nehra these love
es were the most disgraceful blemishes in a life
ise of a far higher moral character than has been
nly supposed. As to the marquis, his use of let
het is perfectly defensible on the theory of the exist
f lettres de cachet at all. They were meant to be
(see LETTRES DE CACHET) by heads of families for
rrection of their families, and Mirabeau, if any son,
deserved such correction. Further, they did have
ect of sobering the culprit, and the more creditable
f his life did not begin till he left Vincennes.
eau, it may be remarked at once, was not a states-
f the Alcibiades type, and he did not develop his
qualities of mind and character until his youthful
es were over. These will be passed over as rapidly
sible, for it was not till 1781 that the qualities which
him great began to appear.

practical purpose which was the great character
Mirabeau, both as a political thinker and a statesman.

With his release from Vincennes begins the second
of Mirabeau's life. He found that his Sophie was a
ized version of a rather common and ill educated
and she speedily consoled herself with the affecti
young officer, after whose death she committed
Mirabeau first set to work to get the sentence of de
hanging over him reversed, and by his eloquence
succeeded but got M. de Monnier condemned in the

ole law proceedings. From Pontarlier he went to
here he claimed the court's order that his wife should
to him She naturally objected, but his eloquence
brave won in court, even against Portalis, the leader
Aix bar, had he not in his excitement accused his
respectability on which the court pronounced a decree
in favour He then with his usual impetuosity inter-
in the suit pending between his father and mother
the parlement of Paris, and so violently attacked
his powers that he had to leave France and again go
and and try to live by literary work. About this
from his connexion with Madame de Nehra, which
to the crowning years of toil and brought out the
best of his character. She was the daughter of
n Haren, a Dutch statesman and political writer,
a woman of a far higher type than Sophie, more
d, more refined, and more capable of appreciating
his good points and helping him to control his
s. With her the lion became a lamb, and his life
engthened by the love of his *petite horde*, Madame
ra, her baby son, afterwards Lucas de Montigny,
little dog Chico. After a period of work in
d he took himself to England, where his treatise on
le Cachet had been much admired, and where he
n admitted into the best Whig literary and political
of London, through his old schoolfellow Gilbert Elliot,
d now inherited his father's baronetcy and estates,
come a leading Whig member of parliament. Sir
introduced him freely, but of all his English friends
em to have been so intimate with him as Lord Lans-
and Mr (afterwards Sir Samuel) Romilly. The
became particularly attached to him, and really
ood his character; and it is strange that his remarks
Mirabeau in the fragment of autobiography which
and Mirabeau's letters to him, should have been
d by French writers. Romilly was introduced to
im by Dumont, and readily undertook to translate
nsiderations on the Order of Cincinnatus. Romilly
thus of him in his autobiography:

count was difficult enough to please, he was sufficiently
d with the beauties of the original. He went over every
he translation with me, observed on every passage in which
was not done to the thought or the force of the expression
d made many useful criticisms. During the occupation
occasion to see one another often, and became very intr
nd, as he had read much, had seen a great deal of the world,
inted with all the most distinguished persons who at that
formed either the royal court or the republic of letters in
had a great knowledge of French and Italian literature, and
d very good taste, his conversation was extremely interest
not a little instructive. I had such frequent opportunities
g him at this time, and afterwards at a much more import
od of his life, that I think his character was well known
I doubt whether it has been so well known to the world,
re entertained that great injustice has been done him. This,
a true reporting, when one considers that, from the first
he set out upon the career of an author, he had been
how numerous or how powerful might be the
he should provoke. His vanity was certainly excessive;
have no doubt that in his public conduct as well as in his
s, he was deeply conscious good that his ambition was of
ble kind and that he proposed to himself the noblest ends;
s, however, like many of his countrymen, who were active in
anitous Revolution which afterwards took place, not suffi
scrupulous about the morality by which those ends were to be
blished. He indeed in a certain degree professed this; and more
nce I have heard him say that there were occasions upon
'la petite morale était comme de la grande.' It is not sur
that with such maxims on the one hand in his mouth, unguarded
expressions, and careless of his reputation he should have
l room for the circulation of many stories to his disadvan
Violent, impetuous, conscious of the superiority of his
, and the declared enemy and denouncer of every species of
and oppression, he could not fail to shock the prejudices,
se the interests, to excite the jealousy, and to wound the
f many descriptions of persons. A mode of refuting his
open to the basest and vilest of mankind, was to represent
him as a monster of vice and profligacy. A scandal once
foot is strengthened and propagated by many, who have no
against the object of it. They delight to talk of what is ext
nary; and what more extraordinary than a person so admira
his talents and so contemptible for his conduct, professing
writings principles so excellent and in all the offices of publ
private life putting in practice those which are so detestab
indeed possessed demonstrative evidence of the falsehood of
the anecdotes which by men of high character were related
prejudice." *Life of Sir S. Romilly*, vol. i. p. 58.

This luminous judgment, the best that is extant
character of Mirabeau, deserved to be quoted at leng
must be noted that it was written by a man of ac
ledged purity of life, who admired Mirabeau in earl
not when he was a statesman, but when he was
struggling literary man. This close association
Romilly, and his friends Baynes, Trail, and Wilson
credit to Mirabeau, and must have helped that
revolution against his passions which was passing
him. He was a warm friend, and first made R
acquainted with Lord Lansdowne, and tried to get
seat in parliament. Lord Lansdowne was himse
extraordinary man, and the first of the new Whigs
well feel sympathy with the statesman of the
Revolution. The *Considerations sur l'ordre de Cinci*
which Romilly translated was the only important
Mirabeau wrote in the year 1785, and it is a good
men of his method. He had read a pamphlet publis

onths he spent at Berlin were important ones in the of Prussia, for in them Frederick the Great died. ters just mentioned show clearly what Mirabeau did at he saw, and equally clearly how unfit he was to plomatist; for, with all his knowledge of men and luence over them, he thought (and showed he t) too much of himself ever to be able to surprise cret thoughts and intentions. He certainly failed ciliate the new king Frederick William; and thus Mirabeau's one attempt at diplomacy. During his he had made the acquaintance of a Major Manvillon, he found possessed of a great number of facts and s with regard to Prussia, these he made use of in work on Prussia published in 1788, a Romilly show that he could write more than a fugitive et. But, though his *Monarchie Prussienne* gave general reputation for historical learning, he had in ne year lost a chance of political employment. He ered himself as a candidate for the office of secretary Assembly of Notables which the king had just con and to bring his name before the public published financial work, the *Dénonciation de l'agiotage*, ed to the king and notables, which abounded in olent diatribes that he not only lost his election, but iged to retire to Tongres; and he further injured his ts by publishing the reports he had sent in during ret mission at Berlin. But 1789 was at hand; the general was summoned; Mirabeau's period of pre was over, and he was at last to have that oppor- of showing his great qualities both as statesman tor on a worthy arena.

hearing of the king's determination to summon ates-general, Mirabeau started for Provence, and to assist at the preliminary conference of the e of his district. They rejected him; he appealed *iers état*, and was returned both for Aix and for les. He elected to sit for the former city, and was at the opening of the states-general on May 4, From this time the record of Mirabeau's life forms t history of the first two years of the Constituent ly, for at every important crisis his voice is to be though his advice was not always followed. It is ble here to detail minutely the history of these two l years; it will be rather advisable to try and the manner in which Mirabeau regarded passing and then show how his policy justifies our analysis.

Mirabeau possessed at the same time great logical ess and most passionate enthusiasm; he was there th a statesman and an orator, and the interest of two years of his life lies mainly in the gradual but victory of the statesmanlike and practical over the ve and oratorical qualities. From the beginning au recognized that government exists in order that k of the population may pursue their daily work in nd quiet, and that for a Government to be successful be strong. In this practical view of [illegible]d of a executive lies one of Mirabeau's greatest titles to the f statesman. At the same time he thoroughly com ded that for a Government to be strong it must be nony with the wishes of the majority of the people, at the political system of Louis XIV. was now fall- lack of this. He had carefully studied the English ution in England under the guidance of such men d Lansdowne, Sir Gilbert Elliot, and Romilly, and ated it with the wise approval of its powers of ex which characterized the new Whigs, and not with nd admiration of Burke. He understood the key- f the practical success of the English constitution he irresponsibility of the king, the solidarity of the ers, and the selection of the executive from among the majority of the representatives of the country; hoped to establish in France a system similar in pr but without any slavish imitation of the details English constitution.

In the first stage of the history of the states Mirabeau's part was very great. He was soon rec as a leader, to the chagrin of Mounier, because he knew his own mind, and was prompt at emergencie him is to be attributed the successful consolidation National Assembly, its continuance in spite of De Br the carpenters, and the address to the king for th drawal of the troops assembled by De Broglie. W taking of the Bastille had assured the success Revolution, he was the one man who warned the As of the futility of passing fine sounding decrees a necessity for acting. He declared that the famous of August 4 was but peo immense theoretical liberty while not assuring th practical freedom, and overthrowing the old regime ould be constituted. Still more did his foresight when he attacked the dilatory behav the Assembly, which led to the catastrophes of the 5 6th October. He implored the Assembly to strike the iron was hot, and at once solve in a practical the difficult problems presented by the aboliti feudalism. But the Assembly consisted of men in enced in practical politics, who dreamed of drawing ideal constitution precluded by a declaration of ri imitation of the Americans; and for two mont Assembly discussed in what words the declaration be expressed, while the country was in a state of a declaring old laws and customs abolished and hav new ones to obey or follow, disowning the old a trative system and having no new one yet institute Paris was starving and turbulent, and the queen friends planning a counter revolution. The result two months' theorizing was the march of the wo Versailles, and the transfer of the king to Paris. M now saw clearly that his eloquence would not enab to guide the Assembly by himself, and that he must fore try to get some support. He wished to esta strong ministry, which should be responsible English ministry, but to an assembly chosen to re the people of France better than the English H Commons then represented England. He first tho becoming a minister at a very early date, it we may a story contained in *Mémoires* of the D d'Abrantes, to the effect that in May 1789 the quee to bribe him, but that he refused to be bribed to and expressed his wish to be a minister. The indig with which the queen repelled the idea may hav the cause of his thinking of the Duc d'Orleans as a constitutional king, because his title would of neces parliamentary. But the weakness of Orleans w palpable, and in a famous remark Mirabeau expre utter contempt for him. He also attempted to f alliance with Lafayette, but the general was as v as obstinate as Mirabeau himself, and had his own about a new French constitution. Mirabeau trie time, too, to act with Necker, and obtained the sa the Assembly to Necker's financial scheme, not bec was good, but because, as he said, "no other pl before them, and something must be done."

Hitherto weight has been laid on the practical Mirabeau's political genius; his ideas with regard Revolution after the 5th and 6th October must examined, and this can be done at length, thanks publication of Mirabeau's correspondence with La M study of which is indispensable for any correct kn of the history of the Revolution between 1789 an

n; on singe longtemps l'adresse, non pas la force."
was useless to appeal to Lafayette; he was not a
man himself, and did not appreciate "la force" in
From the month of May 1790 to his death in
791 Mirabeau remained in close and suspected but
tually proved connexion with the court, and drew
up many admirable state-papers for it. In return the
paid his debts; but it ought never to be said that h
bribed, for the gold of the court never made him s
from his political principles—never, for instance, mad
a royalist. He regarded himself as a minister, thou
unavowed one, and believed himself worthy of his
Undoubtedly his character would have been more adm
if he had acted without court assistance, but it mu
remembered that his services deserved some reward
that by remaining at Paris as a politician he had
unable to realize his paternal inheritance. Before h
fluence on foreign policy is discussed, his behavio
several important points must be noticed. On the
question of he took a practical view, and
that the royal power was already sufficiently weak
declared for the king's absolute veto, and against
compromise of the suspensive veto. He knew fro
English experiences that such a veto would be hardl
used unless the king felt the people were on his s
which case it would be a useful check on represent
of the people, and also that if it was used unjust
he power of the purse possessed by the represent
and the very constitutional organization of the
would, as in England in 1688, bring about a blo
revolution, and a change in the person entrusted wi
royal dignity. He saw also that much of the inefli
of the Assembly arose from the inexperience of the me
and their incurable verbosity; so, to establish some
of rules, he got his friend Romilly to draw up a d
account of the rules and customs of the English Ho
Commons, which he translated into French, but whi
Assembly, puffed up by a belief in its own merits, u
to use. On the great subject of peace and war he sup
the king's authority, and with some success. Wh
the good of an executive which had no power? Le
responsible to the representatives of the nation
means; but if the representatives absorbed all exe
power by perpetual interference, there would be six h
kings of France instead of one, which would hardl
change for the better. Again Mirabeau almost alone
Assembly understood the position of the army u
limited monarchy. Contrary to the theorists, he he
the soldier ceased to be a citizen when he became a s
he must submit to be deprived of his liberty to thi
act, and must recognize that a soldier's first d
obedience. With such sentiments, it is no wonde
he approved of Bouillé's vigorous conduct at Nancy,
was the more to his credit as Bouillé was the one
the court influences opposed to him. Lastly, in mat
finance he showed his wisdom: he attacked N
"caisse d'escompte," which was to have the whole
of the taxes, as absorbing the Assembly's power
purse; and he heartily approved of the system of ass
but with the important reservation that they sho
be issued to the extent of more than one-half the v
the land to be sold. This restriction was not ob
and it was solely the enormous over-issue of assigna
caused their great depreciation in value.

Of Mirabeau's attitude with regard to foreign a
is necessary to speak in more detail. He held it to
that the French people should conduct their Revolu
they would, and that no foreign nation had any r
interfere with them, so long as they kept themselves
to their own affairs. But he knew also that neighb
nations looked with unquiet eyes on the progress of
in France, that they feared the influence of the Rev
on their own peoples, and that foreign monarch
being prayed by the French emigrés to interfere on
of the French monarchy. To prevent this interfer
rather to give no pretext for it, was his guiding tho

policy. He had been elected a member of the plomatique of the Assembly in July 1790, and s reporter at once, and in this capacity he was revent the Assembly from doing much harm in foreign affairs. He had long known Montmorin, n secretary, and, as matters became more strained complications with the princes and counts of the e entered into daily communication with the advised him on every point, and, while dictating defended it in the Assembly. Thus in the partiance of the foreign office, for the few months irabeau's death, a harmony was established he minister and the Assembly through Mirabeau, cked for a time the threatened approach of foreign on, and maintained the honour of France abroad. 's exertions in this respect are not the smallest e name of statesman; and how great a work he t proved by the confusion which ensued in this t of affairs upon his death.

leed in the beginning of 1791 his death was very l he knew it to be so. The wild excesses of his l their terrible punishment had weakened his nstitution, and his parliamentary labours consework. So surely did he feel its approach that before the end he sent all his papers over to his sh friend and schoolfellow Sir Gilbert Elliot, who under seal until claimed by Mirabeau's executors. his illness was evidently gaining on him, to his f, because he knew how much depended on his felt that he alone could yet save France from the of her monarch and the present reforms, and foreign interference, which would as surely bring astrophes unparalleled in the history of the world. ife hung the future course of the Revolution. re that science could afford was given by his l physician, the famous chemist Cabanis, to whose on his last illness and death the reader may refer. le, whose faith in him revived in spite of all s, when they heard that he was on his death-bed, street in which he lay quiet, but medical care, g solicitude of friends, and the respect of all the uld not save his life. His vanity appears in its ntic proportions in his last utterances during his ut many of them have something grand in their his last reported expression, when he looked upon -"If he is not God, he is at least His cousin-

When he could speak no more he wrote with hand the one word "dormir," and on April 2, died.

irabeau died, it has been said, the last hope of the mon with Marie Antoinette supreme at court, can it be said that ever have been any real hope for the monarchy? Had she ss like her imperious mother, Louis would have made a nal monarch, but her will was as strong as Mirabeau's he Bourbon monarchy had to meet its fate. The subsets of the Revolution justified Mirabeau's prognostications mémoire of October 15, 1789. The royal family fled e German frontier, and from that moment there sank deep arts of the people not only of Paris, but of the provinces, n that the king and queen were traitors to France, which bly to their execution. The noblesse and the foreign and he queen relied proved but a source of weakness. The Mirabeau had said, was no army which could fight, and emy of the emigrés could do nothing against revolutionary arms. The intervention of foreign and only sealed the and forwarded the progress of the Revolution, not in a natural development, but to the terrible resource of the error. With regard to the Assembly too, and its constirabeau had shown his foresight. The constitution of llent as it was on paper, and well adapted to an ideal not deal adequately with the great problems of the time and by its ridiculous weakening of the executive was a modern state. Surely if events ever proved a man's agacity, the history of the French Revolution proved .

A few words must be added on Mirabeau's manner of work and his character.

No man ever so thoroughly used other men's work, and yet made it all seem his own. "Je prends mon bien ou je le trouve" is as true of him as of Molière. His first literary work, except the bombastic but eloquent *Essai sur le Despotisme*, was a translation of Watson's *Philip II.*, accomplished in Holland with the help of Durival; his *Considérations sur l'ordre de Cincinnatus* was based on an American pamphlet, and the notes to it were contributed by Target, while his financial writings were all suggested by the Genevese exile Clavières. During the Revolution he received yet more help; men were proud to labour for him, and did not murmur because he absorbed all the credit and fame. Dumont, Clavières, Duroveray, Pellenc, Lamourette, and Reybaz were but a few of the most distinguished of his collaborators. Dumont was a Genevese exile, and an old friend of Romilly's, who willingly prepared for him those famous addresses which Mirabeau used to make the Assembly pass by sudden burst of eloquent declamation; Clavières and Duroveray helped him in finance, and not only worked out his figures, but even wrote his financial discourses. Pellenc was his secretary, and wrote the speeches on the goods of the clergy and the right of making peace, and even the Abbé Lamourette wrote the speeches on the civil constitution of the clergy. Reybaz, whose personality has only been revealed within these last ten years, not only wrote for him his famous speeches on the assignats, the organization of the national guard, &c., which Mirabeau read word for word at the tribune, but even the posthumous speech on succession to estates of intestates, which Talleyrand read in the Assembly as the last work of his dead friend. Yet neither the gold of the court nor another man's conviction would make Mirabeau say what he did not himself believe, or do what he did not himself think right. He took other men's labour as his due, and impressed their words, of which he had suggested the underlying ideas, with the stamp of his own individuality; his collaborators themselves did not complain, they were but too glad to be of help in the great work of controlling and forwarding the French Revolution through its greatest thinker and orator. True is that remark of Goethe's to Eckermann, after reading Dumont's *Souvenirs*. "At last the wonderful Mirabeau becomes natural to us, while at the same time the hero loses nothing of his greatness. Some French journalists think differently. . . . The French look upon Mirabeau as their Hercules, and they are perfectly right. But they forget that even the Colossus consists of individual parts, and that the Hercules of antiquity is a collective being, a gigantic personification of deeds done by himself and by others."

There was something gigantic about all Mirabeau's thoughts and deeds. The excesses of his youth were beyond all bounds, and severely were they punished, his vanity was immense, but never spoilt his judgment: his talents were enormous, but could yet make use of those of others. As a statesman his wisdom is indubitable, but by no means universally recognized in his own country. Lovers of the *ancien régime* abuse its most formidable and logical opponent, believers in the Constituent Assembly cannot be expected to care for the most redoubtable adversary of their favourite theorists, while admirers of the republic of every description agree in calling him from his connexion with the court the traitor Mirabeau. As an orator more justice has been done him: his eloquence has been likened to that of both Bossuet and Vergniaud, but it had neither the polish of the old 17th-century bishop nor the flashes of genius of the young Girondin. It was rather parliamentary oratory in which he excelled, and his true compeers are rather Burke and Fox than any French speakers. Personally he had that which is the truest mark of nobility of mind, a power of attracting love, and winning faithful friends. "I always loved him," writes Sir Gilbert Elliot to his brother Hugh; and Romilly, who was not given to lavish praise, says, "I have no doubt that in his public conduct, as in his writings, he was desirous of doing good, that his ambition was of the noblest kind, and that he proposed to himself the noblest ends." What more favourable judgment could be passed on an ambitious man! What finer epitaph could a statesman desire?

The best edition of Mirabeau's works is that published by Bla[illegible] of in 1822, in 10 vols., which has been his *Diverses Oratoires*, from this [illegible]tion, however, many of the best [illegible] works, and the *Monarchie Prus*[illegible] in 4 vols., 1788, are to be found. For the life consult *Mirabeau. Mémoires sa et privés*, 8 vols., 1834 and, what is of most importance, *Mémoire littéraires et politiques de Mirabeau écrits par lui-même, par* [illegible] *et publiés* [illegible] which was issued by M. Lucas de Montigny in 8 vols., Paris 1841. See also Dumont, *Souvenirs sur Mirabeau*, 1832; Duval, *Souvenirs sur Mirabeau*, 1848; Victor Hugo, *Etude sur Mirabeau*, 1834; *Mirabeau's Jugendleben*, Breslau, 1839; Schmidt-Weissenfels, *Mirabeau und seine Zeit*, Leipsic, 1834; *Mirabeau, a Life History*, London, 1848. The publication of the *Correspondance entre Mirabeau et le Comte de la Marck* by Ad. Bacourt, 3 vols., 1851, marks an epoch in our exact knowledge of Mirabeau and his career. The most useful modern books are Louis de Loménie, *Les Mirabeau*, 1878, which, however, chiefly treats of his father and [illegible] *Collaborateurs* [illegible] of Reybaz throwing intimate light on Mirabeau's mode of work; and, lastly, H. Reynald, *Mirabeau et la Constituante*, 1875. On his eloquence and the share his collaborators had in his speeches, see Aulard, *L'Assemblée Constituante* 1882. For his death see the curious brochure of his physician Cabanis, *Journal de la maladie et de la mort de Mirabeau*, Paris, 1791. (H. M. S.)

ABEAU, Victor Riqueti, Marquis de (1715 himself a distinguished author and political economist more famous as the father of the great Mirabeau, n at Pertuis near the old chateau de Mirabeau on 1, 1715. He was brought up very sternly by his and in 1729 joined the army. He took keenly to camg but never rose above the rank of captain, owing unable to get leave at court to buy a regiment. came into the family property on his father's and spent some pleasant years till 1743 in literary ip with his dear friend, Vauvenargues, and de Pompignan, which might have continued had suddenly determined to marry—not for money, but ed estates. The lady whose property he fancied was ne Vieuxe, daughter of a M. de Vassan, a brigadier in y, and widow of the Marquis de Saulveboeuf, whom ed without previously seeing her on April 21, 1743. garrison at Bordeaux, Mirabeau had made the tance of Montesquieu, which may have made him thoughts to political speculations; anyhow it was leisure after returning from the army that he wrote

st work, his *Testament Politique* (1747), which led for the prosperity of France a return of the noblesse to their old position in the Middle Ages. ork, written under the influence of the feudal ideas sed upon him by his father, was followed in 1750 book on the *Utilité des Etats Provinciaux*, full of wise considerations for local self-government, which blished anonymously, and had the honour of being ted to Monte-squieu himself. In 1756 Mirabeau his first appearance as a political economist by blication of his *Ami des Hommes ou traité de ulation*. This work has been often attributed to luence, and in part even to the pen, of Quesnay, the of the economical school of the physiocrats, but ally written before the marquis had made the tance of the physician of Madame de Pompadour. 0 he published his *Théorie de l'Impôt*, in which he d with all the vehemence of his son the farmers of the taxes, who got him imprisoned for eight Vincennes, and then exiled to his country estate at . At Bignon the school of the physiocrats was established, and the marquis surrounded himself evotees, and eventually in 1765 bought the *Journal riculture, du commerce, et des finances*, which became gan of the school. He was distinctly recogd a leader of political thinkers by Prince Leopold

scany, afterwards emperor, and by Gustavus III den, who in 1772 sent him the grand cross of er of Vasa. But the period of his happy literary over, and his name was to be mixed up in scandalous lawsuit. Naturally his marriage ot been happy; he had separated from his wife utual consent in 1762, and had, he believed, d her family in the provinces by a lettre de cachet, n 1772 she suddenly appeared in Paris, and soon commenced proceedings for a separation. The poor is did not know what to do; his sons were a great e to him, and it was one of his own daughters who ncouraged in vain to take this step. Yet he was mined to keep the case quiet if possible for the sake of me de Pailly, a Savoy lady whom he had loved since But his wife would not let him rest; her plea was d in 1777, but she renewed her suit, and, though reat Mirabeau had pleaded his father's case, was sue- l in 1781, when a decree of separation was proed. This trial had quite broken the health of the us, as well as his fortune, he sold his estate at n, and hired a house at Argenteuil, where he lived y till his death on July 11, 1789.

For the whole family of Mirabeau, the one book to refe Louis de Loménie's *Les Mirabeau*, 2 vols., 1878, and it is gre be regretted that the talented author did not live to treat th of the great Mirabeau and his brother. See also Lucas d tigny's *Mémoires de Mirabeau*, and, for the marquis's econ views, De la Vergne's *Économistes français du 18me siècle*.

MIRAGE. See Light, vol. xiv. p. 600.

MIRAMON, Miguel, a Mexican soldier of I extraction, was born in the city of Mexico, Septemb 1832, and shot along with the emperor Maximil Queretaro, June 19, 1867. While still a student he l to defend the military academy at Chapultepec again forces of the United States; and, entering the army in he rapidly came to the front during the civil wars th turbed the country. It was largely due to Miramon's su of the ecclesiastical party against Alvarez and Com that Zuloaga was raised to the presidency; and in 18 was called to succeed him in that office. Decisively however, by the Liberals, he fled the country in 186 spent some time in Europe earnestly advocating f intervention in Mexican affairs; and when he retur was as a partisan of Maximilian. His ability as a was best shown by his double defence of Puebla in

MIRANDA, Francisco (1754–1816), was b Santa Fe in New Granada in 1754. He entered the and served against the English in the American Independence. The success of that war inspire with a hope of being the Washington of his own co and a belief that the independence of Spanish A would increase its material prosperity. With these he began to scheme a revolution, but his schemes we covered and he had only just time to escape to the States. Thence he went to England, where he was duced to Pitt, but chiefly lived with the leading m of the opposition—Fox, Sheridan, and Romilly. F no help in his revolutionary schemes, he travelled g greater part of Europe, notably through Austr Turkey, till he arrived at the court of Russia, he was warmly received, but from which he was dis though with rich presents, at the demand of the S ambassador, backed up by the envoy of France. Th of the dispute between England and Spain about Sound in 1790 recalled him to England, where a good deal of Pitt, who had determined to ma of him to "insurge" the Spanish colonies, but the p arrangement of the dispute again destroyed his hop April 1792 he went to Paris, with introductions to and the leading Girondists, hoping that men who wer ing so hard for their own freedom might help his c men in South America. France had too much to fighting for its own freedom to help others; but Mi friends sent him to the front with the rank of of brigade. He distinguished himself under Dum was intrusted in February 1793 with the conduct siege of Maestricht, and commanded the left wing French army at the disastrous battle of Neerv Although he had given notice of Dumouriez's pr treachery, he was put on his trial for treason on M He was unanimously acquitted, but was soon again into prison, and not released till after the 9th The He again mingled in politics, and was sentenced deported after the struggle of Vendémiaire. Yet he e and continued in Paris till the *coup d'état* of Fr caused him finally to take refuge in England. H found Pitt and Dundas once more ready to listen and the latter sent a special minute to Colonel the governor of Trinidad, to assist General M schemes in every possible way; but, as neither would or could give him substantial help, he went United States, where President Adams gave him fai but nothing more. Once more he returned to E

dington might have done something for him but gnature of the peace of Amiens in 1802. At the ough in no way amnestied, he returned to Paris, promptly expelled by the First Consul, who was r to be on good terms with the court of Spain. nted in further efforts to get assistance from and the United States, he decided to make an on his own responsibility and at his own expense. two American citizens, Colonel Smith and Mr equipped a small ship, the "Leander," in 1806, the help of the English admiral Sir A Cochrane nding near Caracas, and proclaimed the Colombian He had some success, and would have had more a false report of peace between France and caused the English admiral to withdraw his At last in 1810 came his opportunity, the n Spain which brought about the Peninsular divided the authorities in Spanish America some declared for Joseph Bonaparte, others for d VII., while others again held to Charles IV. moment Miranda again landed, and had no difficulty g a large party together who declared a republic Venezuela and New Granada or Colombia But 's desire that all the South American colonies should a federal republic be formed, awoke the selfish l pride of individual provincial administrations, weakened the cause, which further was believed to ul to heaven owing to a great earthquake on 6, 1812. The count of Monte Verde, the Bourbon , had little difficulty in defeating the disunited Miranda, and on July 26 the general capitulated ition that he should be deported to the United The condition was not observed; Miranda was om dungeon to dungeon, and died in 1816 at Cadiz. re allusions to Miranda's early life in nearly all memoirs of but they are not generally very accurate For his trial see t Roux, *Histoire Parlementaire*, xxvii. 26 ,0 For his see Biggs, *History of Miranda's Attempt in South America*, 1809; and Veggasi, *Revolucion de la Colombia*.

ANDOLA. See Pico.

KHOND (1433 1498). Mohammed bin Khâwand Mahmúd, commonly called Mirkhwand or Mirk more familiar to Europeans under the name of nd, was born in 1433, the son of a very pious and man who, although belonging to an old Bokhara of Sayyids or direct descendants of the Prophet, d died in Balkh. From his early youth he applied to historical studies and literature in general. In where he spent the greater part of his life, he gained our of that famous patron of letters, Mir 'Alíshír 40), who served his old school fellow the reigning Husain (who as the last of the Timúrides in Persia the throne of Herát in 1468), first as keeper seal, afterwards as governor of Jurján. At the of this distinguished statesman and writer nd began about 1474, in the quiet convent of yah, which his patron had founded in Herát as a f retreat for literary men of merit, his great work on al history, the largest ever written in Persian, and present day an inexhaustible mine of information Eastern and Western scholars. It is named *-ussafá ji sírat-ulanbiái walmuluk walkhulafá* or *of Purity on the Biography of Prophets, Kings, and*. That the author has made no attempt at a critical ation of historical traditions can scarcely be called a fault of his, since almost all Oriental writers are deficient in sound criticism; more censurable is his flowery and often bombastic style, but in spite of this drawback, and although, in our own age, the discovery of older works on Asiatic history has diminished to some extent the value of Mirkhond's *Rauzat*, it still maintains its high position as one of the most marvellous achievements in literature from the pen of one man, and often elucidates, by valuable text corrections, various readings, and important additions, those sources which have lately come to light. It comprises seven large volumes and a geographical appendix, but internal evidence proves beyond doubt that the seventh volume, the history of the sultan Husain (1438 1505), together with a short account of some later events down to 1523, cannot have been written by Mirkhond himself, who died in 1498. He may have compiled the preface, but the main portion of this volume is probably the work of his *grandson*, the equally renowned historian Khwandamir (1475 1534), to whom also a part of the appendix must be ascribed.

The following is a summary of the contents of the other six volumes. Vol i. Preface on the usefulness of historical studies, history of the creation, the patriarchs, prophets, and rulers of Israel down to Christ, and the Persian kings from the mythical times of the Peshdadian to the Arab conquest and the death of the last Sasanian Yazdajird III. in 30 A.H. (651 A.D.). Vol. ii. Mohammed, Abúbekr, 'Omar, 'Othmán, and 'Alí. Vol. iii. The twelve imams, and the Omayyad and Abbasid caliphs down to 656 A.H. (1258 A.D.). Vol. iv. The minor dynasties contemporary with and subsequent to the 'Abbasids, down to 778 A.H. (1376 A.D.), the date of the overthrow of the Kurt dynasty by Timur. Vol. v. The Moghuls down to Timur's time. Vol. vi. Timúr and his successors down to Sultan Husain's accession in 873 A.H. (1468 A.D.). The best accounts of Mirkhond's life are De Sacy's "Notice sur Mirkhond" in his *Mémoires sur diverses antiquités de la Perse*, Paris, 1793; Jourdain's "Notice de l'histoire universelle de Mirkhond" in the *Notices et Extraits*, vol. ix., Paris, 1812 (together with a translation of the preface, the history of the Ismailians, the conclusion of the sixth volume, and a portion of the appendix); Eliot, *History of India*, vol. iv. p. 127 *sq.*; Morley, *Descriptive Catalogue*, London, 1854, p. 30 *sq.*; Rieu, *Cat. of Persian MSS. of the Brit. Mus.*, vol. i., London, 1879, p. 87 *sq.* Mirkhond's patron Mir Alí-shír, to whom the Rauzat is dedicated, died three years after him (1501).

Besides the lithographed editions of the whole work in folio, Bombay, 1853, and Teheran, 1853-56, and a Turkish version Constantinople, 1842, the following portions of Mirkhond's history have been published by European Orientalists: *Vie de Kaid, roi de Perse*, by D. Shea, London, 1832 (Oriental Translation Fund); *L'Histoire de la dynastie Samanides*, by [illegible] (on the above mentioned *Mémoires*), *Histoire des Samanides de la Perse* by Jaubert, Paris, 1813, *Historia patriarcharum regum Persarum*, Pers. and Lat. by Jenisch, Vienna, 1782, *Mirchondi historia Taheridarum*, Pers. and Lat., by Mitscherlich, Gottingen, 1811 2d ed., Berlin, 1819; *Historia Samanidarum*, Pers. and Lat., by Wilken, Gottingen, 1808, *Histoire des Samanides*, Turkish text by Defremery, Paris, 1845; *Historia Ghaznevidarum*, Pers. and Lat., by Wilken, Berlin, 1832, *Geschichte der Sultane aus dem Geschlechte Ilech*, Turkish and German, by Wilken, Berlin, 1835, followed by Erdmann's *Erzählungen und Denkmäler*, Kazan, 1850; *Historia Seldschukidarum*, ed. Vullers, Giessen, 1837, and a German translation by the same; *Histoire des Sultans du Kharezm*, in Persian, by Defremery, Paris, 1842, *History of the Atabeks of Syria and Persia*, in Persian, by W. Morley, London, 1848, *Historia Gharidarum*, Pers. and Lat., by Mitscherlich, Lond. and Gott., 1817; *Histoire des Sultans Ghourides*, translated into French by Defremery, Paris, 1844; *Life of Djenghiz Khan*, in Persian, by Jaubert, Paris, 1824 (see also extracts from the same 4th volume in French translation by Langlès in vol. vi. of *Notices et Extraits*, Paris, 1799, p. 192 *sq.*, and by Hammer in *Sur les ori. des Russes*, St Petersburg, 1825, p. 59 *sq.*). "Timur's Expedition against Tuktamish Khan," Persian and French, by Charmoy, in *Mémoires de l'Acad. Imper. de St Petersbourg*, 1836, pp. 270-321 and 441-474. (H. F.)

MIROPOLIE, a town of Russia, situated in the government of Kursk, district of Sudja, 83 miles south-west of Kursk and 25 miles from the Sumy railway station. It is supposed to have been founded in the 17th century, when it was fortified against the raids of Tartars. The fertility of the soil led to the settlement of large villages close by the fort, and the 10,800 inhabitants of this town are still engaged mostly in agriculture. There is also an extensive manufacture of boots.

MIRROR. It is only since the early part of the 16th century that mirrors have become articles of household furniture and decoration. Previous to that time—from the 12th to the end of the 15th century—pocket mirrors or small hand mirrors carried at the girdle were indispensable adjuncts to ladies' toilets. The pocket mirrors consisted of small circular plaques of polished metal fixed in a shallow circular box, covered with a lid. Mirror cases were chiefly made of ivory, carved with relief representations of love

Alíshír not only excelled as poet both in Chaghatái, in s epopees gained him the foremost rank among the classic n that language, and in Persian, but composed an excellent n or biography of contemporary Persian poets.

estic scenes, hunting, and games, and sometimes
tions of popular poetry or romance. Gold and
enamels, ebony, and other costly materials were
used for mirror cases, on which were lavished the
decorative efforts of art workmanship and costly
g. The mirrors worn at the girdle had no cover,
re furnished with a short handle. In 625 Pope
e IV sent Queen Ethelberga of Northumbria a
of a silver mirror; and there is ample evidence
early Anglo-Saxon times mirrors were well known
and. It is a remarkable fact that on many of the
d tones of Scotland, belonging probably to the
, or 9th century, representations of mirrors, mirror
d comb occur.

method of backing glass with thin sheets of metal
ors was well known in the Middle Ages at a time
ed and silver mirrors were almost exclusively
d. Vincent de Beauvais, writing about 1250, says
mirror of glass and lead is the best of all "quia
propter transparentiam melius recipit radios." It
n that small convex mirrors were commonly made
hern Germany before the beginning of the 16th
and these continued to be in demand under the
f bull's-eyes (*Ochsen Augen*) till comparatively
times. They were made by blowing small globes
into which while still hot was passed through
e a mixture of tin, antimony, and resin or tar.
he globe was entirely coated with the metallic com-
nd cooled it was cut into convex lenses, which of
ormed small but well defined images. It appears
ention was drawn to the method of making mirrors
e as early as 1317, in which year a "Magister de
a," who knew how to work glass for mirrors, broke
ement had made to m ce Venetians,
m their hands a large quan of mixed alum and
which they could find no u e.

s, however, in Venice that the making of glass
on a commercial scale was first developed; and
ceptre ing republic enjoyed a rich and much prized
ly of the manufacture for about a century and a
n 1507 two inhabitants of Murano, representing
y possessed the secret of making perfect mirror
a knowledge hitherto confined to one German glass-
obtained an exclusive privilege of manufacturing
for a period of twenty years. In 1564 the mirror-
of Venice, who enjoyed peculiar privileges, formed
ves into a corporation. The product of the
glass-houses quickly supplanted the mirrors of
l metal, and a large and lucrative trade in Venetian
irrors sprang up. They were made from blown
s of glass which were slit, flattened on a stone,
y polished, the edges frequently bevelled, and the
silvered by an amalgam. The glass was remarkably
d uniform, the "silvering" bright, and the sheets
e of considerable dimensions. In the inventory
effects made on the death of the great French
Colbert enumerated a Venetian mirror 16 by
es, in a silver frame, valued at 8016 livres, while
e by Raphael was put down at 3000 livres.

manufacture of glass mirrors, with the aid of Italian
en, was practised in England by Sir Robert Mansel
n the 17th century and about 1670 the duke of
gham was conducting a glass-work at Lambeth
lint glass was made for looking-glasses. These old
mirrors, with bevelled edges in the Venetian
, are still well known.

Venetians guarded with the utmost jealousy the
of their varied manufactures, and gave most excep-
rivileges to those engaged in such industries. By
tatutes any glassmaker carrying his art into a foreign state was ordered to return on the pain imprisonment of his nearest relatives, and should disobey the command emissaries were delegated to s the contumacious subject. In face of such a stat Colbert attempted in 1664, through the French ambassa in Venice, to get Venetian artists transported to France develop the two great industries of mirror-making a point lace working. The ambassador, the bishop Béziers, pointed out that to attempt to send the requi artists was to court the risk of being thrown into Adriatic, and he further showed that Venice was selling France mirrors to the value of 100,000 crowns and lace three or four time it value. Notwithstanding th circumstances owever, twenty Venetian glass-mir makers were sent to France in 1665, and the manufact was begun under the fostering care of Colbert in Faubourg St Antoine, Paris. But previous to this the of blowing glass for mirrors had been actually practised Tour la Ville, near Cherbourg, by Richard Lucas, Sieur Nehou, in 1653 and by the subsequent combination skill of both establishments French mirrors soon excel in quality those of Venice. The art received a new impu in France on the introduction of the making of plate gl which was discovered in 1691. The St Gobain Gl Company attribute the discovery to Louis Lucas of Neh and over the door of the chapel of St Gobain they h placed an inscription in memory of "Louis Lucas qui venta in 1691 le methode de couler les glaces et install manufacture en 1695 dans le château de Saint Gobain."

Manufacture. The term "silvering," as applied to the for tion of a metallic coating on glass for giving it the properties mirror, was till quite recently a misnomer, seeing that till ab 1840 no silver was used in the process. Now, however, a la proportion of mirrors are made by depositing on the glass a coa of pure silver, and the old amalgamation process is comparati little used.

The process of amalgamation consists in applying a thin amalg of tin and mercury to the surface of glass, which is done o perfectly flat and horizontal slab of stone bedded in a heavy, i bound wooden frame, with a gutter running round the outer e surface of this table, which must be perfectly smooth leve spread a sheet of thin tin foil, somewhat larger than the g *to be operated on, and after all folds and creases have been e* ely removed. oking and beating with a cove wooden rubber, the process of "quickening" the foil is commen A small quantity of mercury is rubbed lightly and quickly over whole surface, and the scum of dust, impure tin, and mercur taken off. Mercury is then poured upon the quickened foil, u there it sufficient to float the glass to be silvered (al the edg at one of the sides having been cle har to mercury, the glass (scrupulously cle multaneously with the above operations) is slid from that side surface of the mercury. Weights are placed over the su until the greater part of the amalgamated mercury is pressed *the table is then tilted diagonally, by means of dumb-screws,* all superfluous mercury finds its way to the gutter. The g is left twenty four hour under weights; it is then turned silvered side up, and removed to a drainer with inclining shel where by degrees, as it dries and hardens, it is brought vertical p tion, which in the case of large sheets may not arrived at in less than a month. This process yields excel results, pr luces a brilliant silver-white metallic lustre whic only to alteration by exposure to high temperatures, o contact with damp surfaces, but the mercurial vapours to wh the workmen are exposed give rise to the most distressing and f affections.

In 1835 Baron Liebig observed that, on heating aldehyde w an ammoniacal solution of nitrate of silver, in a glass vesse brilliant deposit of metallic silver was formed on the surface of glass. To this observation is due the modern process of silve sil- In practice the process was introduced about 1840; ar is now carried on, with several modifications, in two distinct w called the hot and the cold process respectively. In the for method there is employed a horizontal double-bottomed met table, which is heated with steam to from 35° to 40° C. The g to be silvered is cleaned thoroughly with wet whiting, then was with distilled water, and prepared for the silver with a sensiti solution of tin, which is well rinsed off immediately before removal to the silvering table. The table being raised to proper temperature, the glass is laid, and the silvering solutio

ce poured over it, before the heat of the table has time to dry y part of the surface of the glass. The solution used is prepared follows:—in half a litre of distilled water 100 grammes of trate of silver are dissolved; to this there is added of liquid mmonia (sp. gr. 0·880) 62 grammes; the mixture is filtered, and de up to 8 litres with distilled water, and 7·5 grammes of tartaric d dissolved in 30 grammes of water are mixed with the solution. bout 2·5 litres are poured over the glass for each superficial metre be silvered. The metal immediately begins to deposit on the ass, which is maintained at about 40° C. (104° F.), and in little ore than half an hour a continuous coating of silver is formed e silvered surface is then cleaned by very cautiously wiping with very soft chamois rubber, and treated a second time with a ution like the first, but containing a double quantity of tartaric d. This solution is applied in two portions, and thereafter the ass is once more carefully cleared of all unattached silver and fuse and removed to a side room for backing up.

In silvering by the cold process advantage is taken of the power inverted sugar to reduce the nitrate of silver. This process l en adopted for the silvering of mirrors for astronomical telescopes, tably for Leverrier's great telescope in the Paris Observatory. For linary mirror silvering the following is the process recommended H. E. Benrath. Two solutions are prepared, the first of which ntains the silver salt, and the second the sugar preparation. For e silver solution 800 grammes of nitrate of silver and 1200 grammes nitrate of ammonium are dissolved in 10 litres of water, and 1·3 los of pure caustic soda in 10 litres of water, and of each of these utions 1 litre is added to 8 litres of water, which is allowed to t till the sediment forms and then decanted. The second solution—inverted sugar—is prepared by dissolving 150 grammes of loaf gar with 15 grammes of vinegar in 0·5 litre of water, and boiling e solution for half an hour. After cooling it is made up with water 4200 cubic centimetres. The silvering is done on horizontal bles in a well-lighted and moderately heated apartment, and the ass is cleaned with scrupulous care. For each square centimetre glass operated on 15 cubic centimetres of the silver solution ove described are measured out, and from 7 to 10 per cent. of e solution of inverted sugar is added, both being quickly stirred together and poured rapidly and evenly over the glass. The reduction immediately begins, and the solution exhibits tints passing through se, violet, and black, till in about seven minutes it again becomes ansparent and the deposit of metal is complete. This first deposit extremely thin, and allows the transmission of bluish rays. he exhausted solution with floating and unattached dust like annules of silver is carefully wiped off, the silvered surface washed th distilled water and again treated with the mixed solutions to the tent of half the quantity used in the first application. The finished rface is wiped and washed in the most thorough manner,—for e least trace of caustic soda left would destroy the mirror. The rther processes are the same in both methods of silvering.

The deposit of silver on glass is not so adherent and unalterable under the influence of sunlight and sulphurous fumes as e tin-mercury amalgam, and moreover real silvered glass has a ghtly yellowish tinge. These defects have been overcome by a ocess introduced by M. Lenoir, which consists of brushing over e silvered surface with a dilute solution of cyanide of mercury, hich instantaneously forming a kind of amalgam renders the deposit once much whiter and more firmly adherent than before. To otect the thin metallic film from mechanical injury and the emical action of gases and vapours, it is coated with shellac copal varnish, over which when dry are applied two coatings of d-lead paint.

Platinum Mirrors.—A cheap process of preparing mirror glass is some extent prosecuted in France, whereby a thin but very dherent deposit of platinum is formed on the glass. A solution of loride of platinum with a proportion of litharge and borate of ad dissolved in essential oil of spike is applied with a brush to ell-cleaned glass, which is then placed on edge in a muffle furnace, d the platinum is thus burned in, forming an exceedingly thin t brilliant metallic backing having a somewhat grey lustre. It used only for the lids of cheap boxes, toys, ornamental letters, &c.

Magic Mirrors.—Hand mirrors of metal are still in common use Oriental countries, and especially in Japan and China they continue to be the prevalent form of looking-glass. In the former untry indeed bronze mirrors are articles of the greatest importance the generally meagre furnishing of houses, and besides possessing religious significance. They have been known and used from e most remote period, mention of them being found in Chinese terature of the 9th century. The (reputed) first made Japanese irror, preserved at Isé, is an object of the highest veneration in apan, and an ancient mirror, connected with which is a tradition the effect that is was given by the sun-goddess at the foundation the empire, is a principal article of the Japanese regalia. The irrors of Japan vary in form and size, but in general they consist of thin disks, from 3 to 12 inches in diameter, of speculum etal with handles cast in one piece. The polished face of the irror is slightly convex in form, so that a reflected image is seen proportionately reduced in size; the back of the disk is occupied with characteristic Japanese ornamentation and inscriptions in bold relief, and its rim is also raised to the back. Much attention has been attracted to these mirrors by a singular physical peculiarity which in a few cases they are found to possess. These are known as magic mirrors from the fact that when a strong beam of light is reflected from their smooth and polished surface, and thrown on a white screen, an image of the raised ornaments and characters on the back of the mirror is formed with more or less distinctness in the disk of light on the screen. This peculiarity has at no time been specially observed by the Japanese, but in China it attracted attention as early as the 11th century, and mirrors possessed of this property sell among the Chinese at ten or even twenty times the price sought for the ordinary non-sensitive example. The true explanation of the magic mirror was first suggested by the French physicist Person, who observed that the reflecting surface of the mirrors was not uniformly convex, the portions opposite relief surfaces being plane. Therefore, as he says, "the rays reflected from the convex portion diverge and give but a feebly illuminated image, while, on the contrary, the rays reflected from the plane portions of the mirror preserve their parallelism, and appear on the screen as an image by reason of their contrast with the feebler illumination of the rest of the disk." That such differences of plane in the mirror surface arise is an accidental circumstance due to the way in which it is prepared, a process explained by Professors Ayrton and Perry, by whom ample details of the history, process of manufacture, and composition of Oriental mirrors have been published. A preliminary operation in polishing the surface consists of scoring the cast disk in every direction with a sharp tool. The thicker portions with relief ornament offer more resistance to the pressure of the tool than the thin flat portions, which tend to yield and form at first a concave surface, but this by the reaction of its elasticity rises afterwards and forms a slightly convex surface, while the more rigid thick portions are comparatively little affected. This irregularity of surface is inconspicuous in ordinary light, and does not visibly distort images; but when the mirror reflects a bright light on a screen the unequal radiation renders the minute differences of surface obvious. The ingenious theory of Person has been established by experiments communicated by M. Govi to the academy of Turin in 1861-65, and more recently by investigations of MM. Bertin and Dubosq. See *Annales de Chimie et de Physique* (5th ser., vol. xx.). (J. PA.)

Ancient Mirrors.

The mirror of classical antiquity (κάτοπτρον, speculum) was a thin disk of bronze slightly convex on one side and polished, usually provided with a handle, sometimes mounted on a stand in the form of a female figure (see Costume, vol. vi. p. 453, fig. 1), sometimes fixed inside a circular bronze case. The common size is that of an ordinary hand mirror. Examples large enough to take in the whole figure appear to have been rare. Mirrors of glass are mentioned, and though none of them have been found their existence need not be questioned altogether, since the process of silvering occasionally employed on bronze mirrors suggests that an analogous process may have been applied to glass. But the very large number of mirrors still existing from antiquity shows that bronze was the regular material employed. The alloy known as speculum, producing a very hard metal with great reflecting power, is comparatively seldom met with. Silver mirrors are mentioned, but none have as yet been found.

The principal feature of ancient mirrors, especially those of Etruria, is the design incised on the back (see Etruria, vol. viii. p. 633). While two thousand incised specimens are all that are as yet known from Greece, the number found in Etruria must be nearly a thousand. As a rule the subjects incised are taken from Greek mythology and legend, the names of the persons represented being frequently added in Etruscan letters and orthography. In most cases the style of drawing, the types of the figures, and the manner of composing the groups are true to the characteristics of Greek art. Some may have been imported from Greece; but the greater number appear to have been more or less faithfully imitated from such designs as occurred on the almost innumerable painted Greek vases which the Etruscans obtained from Greece. Even where distinctly Etruscan figures are introduced, such as the heroes Ælius and Celius Vibenna on a mirror in the British Museum, Greek models are followed. The characteristics of Greek art here referred to date from a little before 400 B.C., and continue for some time after. In this period would fall the majority of the Etruscan mirrors, and to this period also belong the Greek incised mirrors, among which may be mentioned for their beauty one representing Leucas and Corinthus, inscribed with their names engraved, *Monuments Grecs*, 1873, pl. 5, published by the Association pour l'encouragement des Études Grecques, and another in the British Museum (*Gazette Arch.*, ii. pl. 27), on the back of which is a figure of Eros which has been silvered over. With this last-mentioned mirror was found the bronze case used to contain it,

back of which is a group of Aphrodite and Eros in repoussée. found in Crete. But most of the Greek mirrors and mirror- having artistic designs are from Corinth. One bears the name artist, Ἀπολλόδωρος ἐποίει (engraved, *Arch. Zeitung*, 1862, pl. g. 1).

haic art (about 300 B.C.) is represented by a mirror in the Museum from Sunium in Attica. The mirror itself is quite but the handle composed of a draped female figure, above head float two cupids. From Etruria there is a comparatively number with archaic incised designs. It may be concluded that ory of mirror enriched with incised designs was not freely in- before 400 B.C. in Etruria and never to any extent in Greece. centre of incised mirrors was the Latian town of Praeneste rnae, and it is of interest in regard to some of the mirrors there that they have inscriptions in early Latin. Artistically ave a purely Greek character. Plain mirrors are found Greek and Roman civilization spread and it may be seen pecimen found in Cornwall, now in the British Museum, e Celtic population of England had adopted the form and es of the mirror from their conquerors. This specimen is ed with a Celtic pattern incised. The shape of the handle tomatic originality. Mirrors were used in Greece, perhaps for divination, as appears, for example, from Pausanias (vii. the method being to let the mirror down into a well by of a string till it reached close to the surface of the water it was pulled up after a little it was expected to show the the sick person on whose behalf the ceremony was performed. as at Patras.

ome recent publications on ancient mirrors are Gerhard, *Etruskische Spiegel*, 1–65, 1 vols. containing 419 plates, for the Greek mirrors; Myloris, Καταστροφή, Athens, 1876 and Dumont, *Bulletin de Correspondance Hellénique*, 1877, see also Friederichs, *Kleinere Kunst und Industrie im Alterthum*, Dressel, ed. p. 15 *sq.*, and Marquardt and Mommsen, *Handbuch der römischen Alterthümer*, vii. pt. 2, p. 670. (A. S. M.)

RZÁPUR, a district in the North Western Provinces dia, lying between 23° 51′ 30″ and 25° 31′ N. lat., etween 82° 9′ 15″ and 83° 0′ 36″ E. long., is bounded N. by Jaunpur and Benares, on the E. by Shahabad ohardagá, on the S. by Sarguja state, and on the W. lahabad and Rewah state, and has an area of 5217 miles. It is crossed from east to west by the ya and Kámur ranges. A central jungly plateau ts these, and separates the valley of the Ganges that of the Son.

population in 1872 was 1,015,203 (male, 520,196, females, 7), of whom 949,641 were Hindus, 64,869 Mohammedans, 0 Christians. The non-Asiatic population numbered 623. hree towns had a population exceeding 5000. Mirzapur, , Chunar, 10,151, and Ahraura, 9091. Out of a Govern- d area of 3048 square miles, 1333 are cultivated, 497 ble waste, and 1218 uncultivable. The part of Mirzapur he north of the Vindhyas is very highly cultivated and peopled, but the rest of the district consists largely of and forests, with a very sparse population. Local manu- comprise carpets of a superior description, brass ware, and . The East Indian Railway traverses the district, above the ank of the Ganges, for a distance of 32 miles. The climate ally warmer and dryer than that of districts farther north st. The mean annual rainfall is 42·7 inches.

RZÁPUR, chief town and administrative headquarters above district, is situated on the south bank Ganges, 56 miles below Allahabád (25° 9′ 13″ N. 82° 38′ 10″ E. long.). The population in 1872 was 4, of whom 55,917 were Hindus and 11,053 Mo- medans. Up to quite recent years Mirzapur was rket in upper India for grain and cotton; but s commercial importance has rapidly decreased, g to the establishment of through railway communica- with Bombay *viâ* Jabalpur, and the rise of Cawnpore e position of a mercantile centre. The river front, with stone *ghat* or flight of stairs, and exhibiting erous mosques, Hindu temples, and dwelling houses of wealthier merchants, with highly decorated façades and carved balconies and door frames, is handsome; but terior of the town is mainly composed of mud huts. manufacture of shellac gives employment to about four and persons; brass ware and carpets are also made. imports consist of grain, sugar, cloth, metals, fruit, s, tobacco, lac, salt, and cotton; the same articles, manufactured lac-dye, shellac, and *ghi*, are exported.

MISDEMEANOUR. "The word misdemeanour," sa Russell (*On Crimes*, vol. i. chap. iv.), "is applied to all the crimes and offences for which the law has not provided particular name." Stephen, in his *Digest of the Crimi Law*, adopts the following mode of distinguishing betwe misdemeanour and other crimes. "Every crime is eith treason, felony, or misdemeanour. Every crime whi amounts to treason or felony is so denominated in the defi tions of crimes hereinafter contained. All crimes not denominated are misdemeanours." It is customary to spe of misdemeanour as implying a less degree of crime th felony (see FELONY). "Misdemeanours," observes Russ in the passage already cited, "have been sometimes term *misprisions*, indeed the word misprision, in its larger sen is used to signify every considerable misdemeanour wh has not a certain name given to it in the law, and it is s that a misprision is contained in every felony whatsoev so that the offender may be prosecuted for misprision at t option of the crown. Misprision, in a more restricted se (or negative misprision), is the concealment of an offen Positive misprisions are contempts or misdemeanours o public character, *e.g.*, maladministration of high offici contempt of the sovereign or magistrates, &c. The r as to punishment, when no express provision has been ma by law, is that "every person convicted of a misdemeano is liable to fine and imprisonment without hard labo (both or either), and to be put under recognizances to ke the peace and be of good behaviour at the discretion the court" (Stephen's *Digest*, art. 22). By 28 & 29 V c. 67 prisoners convicted of misdemeanour and sentenc to hard labour shall be divided into two divisions, one which shall be called the first division, and when a pers convicted of misdemeanour is sentenced to imprisonme without hard labour the court may order him to be treat as a first-class misdemeanant, who shall not be deem a "criminal prisoner" within the meaning of that A The Prison Act, 1877 (§§ 10, 41), requires prisoners c victed of sedition or seditious libel, or attached for conten of court, to be treated as misdemeanants of the first cla

In New York and some other States of the Americ Union the legislature has defined felony as any cri which is or may be punishable with death or imprisonme in a State prison, all other crimes being misdemeanours.

MISHNAH. The *Mishnah*, in the most familiar ap cation of the name, is the great collection of legal decisio by the ancient rabbis which forms in each Talmud the te on which the *Gemara* rests, and so is the fundamen document of the oral law of the Jews. The quest "What is Mishnah?" was asked, however, as early as latter part of the 1st or the early part of the 2d centu though in a somewhat different sense and for a somew different purpose.[1] It will be answered in the course this article in all its bearings.

I. *Name.* Rabbinic tradition has fixed the point *Mishnah* (מִשְׁנָה) by giving its *status constructus* *Mishnath*. Although the word *Mishnah* is not found the Bible, it is no doubt a classical Hebrew term, sig fying something closely akin to *Mishneh* (which te occurs more than once there), as may be seen on compar *Mikveh* with *Mikveh*, *Miknah* with *Mikneh*, *Ma'alah* w *Ma'aleh*, and *Mar'ah* with *Mar'eh*, each two of which a however they may vary in practical application, questionably synonymous terms. The practical sign cations of *Mishnah* are seven in number:—(1) rep tion, *i.e.*, tradition:[2] as such it is the equivalent of

[1] See T. B., *Kiddushin*, 49*a*.

[2] The root *Shanah* (שָׁנָה), from which *Mishnah* is immediately rived, is not merely, as is often thought, to *learn*, to *teach*, but *repeat*; and it is in reality this last meaning which underlies the former.

σεις of Epiphanius,[1] the *traditiones et* δευτερώσεις ome,[2] the δευτέρωσις of Justinian,[3] and the שניה "the second to the law") of the *Arukh*[4]; (2) re- from memory, in contradistinction to reading from ;[5] (3) study: as such it is the equivalent of *h* in the former part of its third signification; (4) tion: as such it is the equivalent of *Midrash* in ter part of its third signification;[6] (5) system, view, line of study and instruction: as such it is al with the Talmudical *Shittah*;[7] (6) a paragraph *Mishnah*: it is invariably employed in this sense in bylonian Talmud, and is identical with the word *ah*, used for the same purpose, in the Palestinian l; and (7) the collection of the decisions of the "oral law," *i.e.*, the *Mishnah* in the concrete sense. ord *Mishnah* has three different plurals: (1) the nal *Mishnayoth* for signification (7), formed on alogy of *Mikraoth* (not, as some think, on that of *oth* or *Midrashoth*); (2) the correct, though que- *Mishniyyoth* for signification (6), formed on the of *Parshayyoth* from *Parashah* (or *Parshah*), not k of that of *Ma'asiyyoth* from *Ma'aseh*, (3), the nat inelegant, but correct, *Meshnoth*,[8] which also for signification (6). Significations (1), (2), (3), d (5) have, however inconsistent it may appear one takes into consideration their respective equi , n. plural whatever. So much for the Hebrew *h*. The Aramaic *Mathntha* will be spoken of

Contents and Nature. -The *Mishnah* consists chiefly *Halakhah*;[9] there is, comparatively speaking, little *h*[10] to be found in it. It is not, however, as many either a commentary on the Halakhic portions of the ench, or on the ordinances of the *Sopherim*, or on ogether. It rather presupposes the knowledge of, spect for, both the Mosaic and the Sopheric laws, only discusses, and finally decides on, the best mode anner of executing these. The discussions and al decisions to be found in the *Mishnah* owe their ce principally to deep meditation on these two of laws, notably on the former, by the rabbis of s ages, but chiefly by those who lived fifty years and one hundred and fifty years after the rise of anity, the names of whom it faithfully gives, along eir respective discussions and decisions. There are y cases to be found in the *Mishnah* which would ly come under the denomination of an *Halakhah le mis-Sinai*, *i.e.*, an explanation (of a law) as directly given by God to Moses, and in uninterrupted suc received from him by the rabbis. Several cases under this name in the *Mishnah* are not *bona fide* c for the test of such an *Halakhah* is that it must have been contested by any one.[12]

3. *Method.* A *Mishnah*, if genuine, never begi a passage of the Pentateuch, and even compar seldom brings direct proof from or gives referenc When there is any exception to this rule it will be on close examination, either that such a paragraph l to a very early age (that of the *Sopherim*), or that be found in another work of the "oral law," and is copied in the *Mishnah*, or, what is more likely, t independent, it belongs to a very late age, or, finall the proof or the reference thus given is only a later tion. One example of the true method of the *Mishna* perhaps, better illustrate the foregoing statement sheet full of theorizing on the subject, and this one e will the more surely suffice because of its mixed (and Sopheric) character. It is the very first paragr the whole *Mishnah*, and runs thus: "From what ti the day) does (may, should) one read the *Shema* taking upon oneself the yoke of the heavenly kng in the evening?"[13] The *Mishnah* does not begin: n duty bound to read the *Shema* in the evening, l it is written (Deut. vi. 7), "And when thou lie-t For, in the first place, the law to read the *Shema* e and morning is not unquestionably Mosaic, as the "And thou shalt talk of them, &c.," do not re this passage of the law particularly, but rather words of the Pentateuch in general;[14] and, secondl needless to say that one is in duty bound to rec *Shema* twice a day, since every Jew readily acknow this duty and executes it, although it is not Mosaic. duty of reading the *Shema*, the grounds on whi duty rests, and how it is best fulfilled, are ful ably discussed, developed, and finally settled i part of the Talmud called *Gemara*,[15] - the busi which it is to discuss the words of the *Mishnah* show the sources of the tradition, and eventually t sage in the Pentateuch (it on such the case rest which the respective disputants had derived their vie

4. *Purpose.* Although it is a book containing Ha decisions, the *Mishnah* was never intended, as many to enable the reader thereof to decide from it immed This mistake is old[16] and widely spread, but a n nevertheless. The purpose of the *Mishnah* was simply to exhibit the development of the "oral and the view taken of the development by the ra various times. For this reason one finds side b with the opinions of the majority those also minority, which latter are very carefully given why, since these opinion of the minority can h decisional effect! The *Mishnah* itself (*'Eduyyoth*,

[8] MS. Add. 464 (University Library, Cambridge), leaf 283*b*.

[9] s word, derived from the root *halakh* (הָלַךְ), to go, is synony- ith *Minhag* (custom, practice) and *Mishpat* (rule), &c.

[10] r the meaning of this term and the Agadic parts which are t d in the *Mishnah*, see MIDRASH.

[11] See R. Asher b. Yehiel (Harosh), *Hilkhoth Mikwaoth* c. 1 after this Rabbi's commentary on *Niddah*, in the printed of the Bab. Talmud, i. 1.

[12] "There are, however, at least sixteen such *bona fide* cases to in the works of the 'oral law.'"

[13] See T. B., *Berakhoth*, on Deut. xi. 19.

[14] *Gemara*, or *Gemara*, signifies concretely discussion on settlement of the contents of the *Mishnah*, from *gemar* (גְּמַר), deeply, to come to a final result; which last signification is, often, to be found also in the Hebrew root *gamar* (גָּמַר).

[15] T. B., *Baba Mezi'a*, 33*a*, and Rashi, *in loco*.

[16] See T. B., *Sotah*, 22*a*.

[17] The word עדיות is variously pointed, — *'Adayoth*, *'Edayoth* in the text, *'Eduyyoth*, which last, if the name come to because of the testimony of the witnesses on which this *M* chiefly rests, would be the only correct one. But it ough remarked that the Babylonian teachers must have spelled it (best things), since its equivalent is given by them as *Be Beḥarotho*). See T. B., *Berakhoth*, 27*a* and elsewhere.

vers this question: it is that the teacher or the judge ter ages may be thus enabled, if he have good grounds taking a view different from that of the majority as n hundreds of years before, to reverse the old decision, orming, on the strength of the example before him, others who agree with him (or without them, if one vote was wanted to reverse the majority) a fresh ority. Thus the Jewish "oral law" can never become ied like the laws of the Medes and Persians.

Language. The *Mishnah* is, on the whole, written almost pure Hebrew; and even the originally non rew word (Aramaic, Greek, Latin, &c.) are so skilfully Hebraized that they are a most creditable testimony he linguistic powers both of many of the disputants tioned in it, whose very words are in most cases given, of the editor[1] or editors who revised them.

Date and Authorship.—R. Yehudah Hannasi (the e), the reputed author (in reality only the principal best among the editors) of the *Mishnah*, was born the year 140 of the Christian era. His name was ll Yehudah b. Shime'on b. Gamliel b. Shime'on b. liel[2] b. Shime'on b. Hillel. On account of his holy g he was surnamed Rabbenu Hakkadosh, and on nt of his great learning and authority he was called ly "Rabbi" ("My Teacher" *par excellence*). Rabbi and ime, however, are no *terminus a quo* for the composi of the *Mishnah*. For, not to speak of many isolated *niyyoth* which can be brought home to R. Meir, to R. bah, to Hillel,[3] to Yose b. Yo'ezer,[4] and to others, even e earlier *Sopherim*,[5] we find that R. Yose b. Halaphta he 1st century already quotes the beginning and end of a whole Mishnic treatise (*Kelim*[6]), and that in the century (or very early in the 2d) another treatise isting of early testimonies ('*Eduyyoth*[7]) was put into r. Moreover, although the phrases *Mishnath R. er b. Ya'akob*[8] and *Mishnath R. 'Akibah*[9] do simply ty the systems, styles, and views of these two ent teachers, there can be little doubt that they and rs besides them, presided over colleges in which the le Halakhic matter was systematically treated and larly gone through. Nor are Rabbi and his time for composition of the *Mishnah* a *terminus ad quem*, for the *nah* was not brought to a close till a very long time wards. Not only did R. Hiyya Rabbah, R. Hosha'yah bah, and Shime'on bar Kappara redact *Mishnayoth*,[10] in the *Mishnah* before us notices are actually found h reach to the end of the 3d century, if not even later. statement that Rabbi was the first to write down the

h Hebrew spoken in the house of the principal editor of the was so correct that rabbis actually learnt the meaning of common words of the Bible from the handmaidens of this house. B. *Bezah Hasshanah*, 26*b*. As for Rabbi himself, he was not a true Hebrew scholar, but a fine Greek scholar also. He was reported in T. B., *Sotah*, 49*b*, he is reported to have exclaimed, in the very one speak in Palestine 'Suri'a'? Let him speak Hebrew or Greek." In using the word 'Suri' for "Surith" he, in fact, makes a punning allusion to the mixed (cut-up) acter of the language, corrupted from Hebrew, Chaldee, Persian, k, and Latin.

This was the opinion of St Paul.

In addition to the above-known Aramaic *Mishnayoth* are those which instinctly so called, as opposed to Biblical, see *Mishnah Kadmonith*, iv. nd contrast with them the language and style of the *Mishnah* in al, and that of the *Boraitha* in particular.

Mishnah Eduyyoth, viii. 7.

See *Mishnah Ma'aser Sheni*, v. 7, *Sotah*, v. 1, 2; *Ne'ilim*, xii. 7, &c.; though it cannot be said that these passages preserve exching of the *Sopherim* in the strictest purity.

See *Mishnah Kelim*, *ut supra*.

See T. B., *Berakhoth*, 28*b*. "It was handed down orally (תנא) that *nayoth* was on that day (when Eleazar b. Azaryah was installed esident) gone through," *i.e.*, recited.

T. B., *Yebamoth*, 19*b*.

Mishnah Sanhedrin, iii. 4.

See *Koheleth Rabbah* on ii. 8 *in medio*.

Mishnah is untrue, because the thing is impossible. the two Talmuds, of which that of Babylonia w finished before the 6th century (if then), know, cer nothing of the writing down of the *Mishnah*. C contrary, their language throughout presupposes the *nah* in their time to have been what its name indic repetition, *i.e.*, a thing acquired by continual reci because, like the other works of the "oral law" (*shebba'al peh*), it was to be, and was, handed down o As for the difficulty of keeping in memory such pendous and vast work as the *Mishnah*, it is som forgotten in this controversy that memory was ai a great variety of mnemotechnic means, such as nu and names of teachers, and by the existence of other of the "oral law," which, although they also we written down, could be easily kept in memory b they rested on letters, words, and verses of the V Pentateuch. Anyhow, there is ample evidence, both tive and positive, that the *Mishnah* as we now h was not committed to writing in the times of Ra for long afterwards. But it certainly does not that no merit is due to Rabbi in connexion wi *Mishnah*. His merit in connexion with it is gr every way. For (1) Rabbi was himself a link chain of tradition, since he had "received" fro own father and so on up to his ancestor Hillel, an higher; (2) he gave in the *Mishnah* his own dec in most cases in accordance with those of the fam Meir, which are thus in a great part secured to u in giving his own decisions he preserved to us good many decisions of the teachers of the 2d ce (1) in collecting all these decisions he anxiously asce the genuine formulas of the older *Mishniyyoth*;[12] did not merely reproduce the formulas which he es the best, but discussed them anew in his own which was composed of men of the highest emine is well known, (6) although he gave on the who very language of the teachers who preceded hi gauged it, guarding it against the barbarisms whi so plentiful in the other works of the "oral law"; a he scattered the *Mishnah* broadcast (though only b of mouth) over all Palestine and Babylonia by me the disciples who flocked to him from all parts of countries. If the *Mishnah*, as it now exists, is not e his, it certainly belongs to him in a great measure more than one sense.

7. *Value and Appreciation.*—Whatever can be favour of the *Agadah* applies with equal if not force to the *Mishnah*, as the latter is a canonic therefore more reliable work of the "oral law." *Mishnah* is one of the richest mines of archæology the world possesses. But it waits yet for the touch to break the spell which holds it bound. however, as the value of the *Mishnah* is, its larity has never been steady, but has been cont fluctuating, and that for various reasons. Even in his time had to appeal for due attention to it. it was neglected in troublous times by the masse ran after the *Agadah*,[13] which, besides being co needed no particular study, it was, in prosperous neglected by the rabbis themselves through the st the Bible and the Talmud.[14] And much more w

se when the Talmud had developed from a mere
s activity to two concrete works of large size.
The Ultimate Writing Down of the Mishnah. The
s of the unhappy Jews had multiplied everywhere
sses, as already stated, preferred, in consequence of
roubles, the *Aggadah*. But the number of the
also diminished through these troubles day by day,
comparatively few that renowned preferred more
re the Talmud (in Palestine the Palestinian and in
nia the Babylonian), which was a better field for
rcise of their ingenuity. The text of the *Mishnah*
have been sealed had it not been ultimately
down. But the writing down of *Halakhoth* or
ad been prohibited in early times. Two considera
owever, ultimately removed all scruples: (1) It
me to do something for God even at a risk when
was apparently deserted.[1] Let one (and a number)
disregarded, so that many (and useful) laws be
ed. The *Halakhoth* of the *Mishnah* were impressed
students few: the power of tyranny increased and
the memory decreased by reason of the persecutions.
Language of the *Mishnah*, although pure and m
rer than the language of several books of the Bible
concise and terse that it could not be understood
t a commentary, and, therefore, even after being
down, it would virtually retain its oral character.
Recensions. The *Mishnah* has three principal recen
(1) the *Mishnah* as presented in the work standing
lf, (2) that on which the Palestinian Talmud rest
) that of the Babylonian Talmud. The first named
last named *Mishnayoth* have always been known
plete; the second, however, was supposed for
hundred years to be imperfect, lacking four
n in *Shabbath*, two entire *Massekhtoth* in the *Seder*
h, the whole of the *Seder Kodashim*, and by far the
part of the *Seder Tohoroth*.[2] But since 1869 this
on also has been known to have been always com
and it is to be found in its entirety in a MS pur
in that year for the University Library of Cam
(Add. 170. 1). Besides these three there are many
recensions, touching, however, only isolated read
These last are to be attributed chiefly to copyists.
igin of the difference between the principal recen
s to be sought in the following two facts. (1)
had himself gone twice through the *Mishnah* and
nself considerably altered the wording of the text;
) his successors in early and late times had wilfully
and corrected the original text.

Divisions and Detailed Contents of the Mishnah. The *Mish*
all recensions is divided into six *Sedarim* (orders), each of
ontains a number of *Massekhtoth* (treatises), which stand
exion with one another. The *Sedarim* are subdivided into *Perakim*
s, and these again into *Halakhoth* or *Mishnayoth* (para-
called *Mishnoth*).[3] The number of the *Sedarim* is six,
the *Massekhtoth* sixty,[4] and that of the *Perakim* 523, or

s is a somewhat inexact application of Ps. cxix. 126, but it ha
re than once acted upon both in ancient and modern times by
s. Compare the explanation given in T. B., *Berakhoth*, 63b,
ithoth, 99*a*.
khah is the only *Massekheth* of this *Seder* of which three entire
s are to be found in the printed editions. Compare Schiller-
, *Occasional Notices*, &c., i. (Cambridge, 1878), Sect. p. 8
T. B., *Baba Metsi'a*, 44*a*, and elsewhere.
ether the word *Massekheth* comes from *Masakh* (מָסַךְ, to pour
mix, &c.), or from *Nasakh* (נָסַךְ, to pour, to mix, to weave
signifies in either case here a mould, a form, a frame. *Me-*
has three several plurals: (1) the common *Massekhtoth* (not
khtoth); (2) the less common *Massekhoth* (see MS. Add. 170. 1,
g to the University Library of Cambridge, leaf 69*a* and else
; and (3) *Massekhtiggoth* (מסכתיות), see *Midrash Rabbah* on
s vi. 8, 9. The Aramaic *Massekhta* (not *Ma'akhta*) has in the
Masekhtha, the use of which is, however, very uncommon.

with a fourth *Perek* to *Bikkurim*, 524.[5] The following is a
of the whole *Mishnah*.[6]

I. ZERA'IM (on Agriculture) preceded by the Treatise on T
giving[7] (1) *Berakhoth* (blessings), in nine chapters; (2)
Lev. xix. 9, &c., in eight chapters; (3) *Pe'ah* (fruit,
&c., doubtful if tithes), in seven chapters; (4) *Kilayim* (on
of plants, animals, and garments respectively), in nine ch
(5) *Shebi'ith* (year of release), in ten chapters; (6) *Terumoth*
to the priests), in eleven chapters; (7) *Ma'aseroth* (on De
), in five chapters; (8) *Ma'aser Sheni* (on Deu
Levitical tithes), in five chapters; (10) *Hallah* (Num. xv.
in four chapters; (11) *'Orlah* (Lev. xix. 23), in three ch
and (12) *Bikkurim* (Deut. xxvi. 1–11), in three comment
chapters.

II. MO'ED (on Festival Times): (1) *Shabbath* (Sabba
(two), in twenty-four chapters; (2) *Erub* (fictitious or ideal u
extended prohibitions), in ten chapters; (3) *Pesah* (Passover
(Passover), in ten chapters; (4) *Yoma* (commonly *Ki
the Day of Atonement), in eight chapters; (5) *Sukk
(Feast of Tabernacles), in eight chapters; (6) *Shekalim* (Lev
), in five chapters; (7) *Yom Tob* (commonly *Beẓah*
eggs"), so-called from the initial words of the treatise (see *Dikdu
be minute of the treatises), on work prohibited or permitted on festivals, in five chapters; (8) *Ta'anith* (Fasts
on the various kinds of new years, a collection of civil the
procession and confession, &c.), in four chapters; (9) *Megillah*
(the Book of Esther), in four chapters; (10) *Mo'ed Katan* (the
Festival), in three chapters; (11) *Hagigah* (a name of the
on Deut. xvi. 16), in three chapters.

III. NASHIM (Women): (1) *Yebamoth* (so called from t
distinctive word of the treatise, but commonly *Yibbum*
ister-in-law, the levirate &c.), in sixteen chapters; (2) *Ke
(marriage-deed, settlement, &c.), in thirteen chapters; (3)
(vows), in eleven chapters; (4) *Nazir* (Num. vi. 2–21),
chapters; (5) *Sotah* (the bitter water, atonement and other rites),
chapters; (6) *Kiddushin* (betrothal and marriage), in four c
(or *Sotah* and chiefly *Sotah*, Num. v. 12–31), in nine chapters.

IV. NEZIKIN, commonly *Nezikin* (Damages, &c., or Ex
n, &c.): (1) *Nezikin* commonly *Baba Kamma* (the
Gate), in ten chapters; *Baba Mẓi'a* (the Middle Gate),
chapters; and *Baba Bathra* (the Last Gate), in ten chapte
thirty chapters; (2) *Sanhedrin* (Court of justice, &c.), in
chapters; (3) *Makkoth* (forty stripes save one, Deut.
chapters; (4) *Shebu'oth* (oaths), in eight chapters; (5) *
(testimonies or *Edioth* (Witnesses), in eight chapters; (6) *
ter), or *Horayoth* (Errors of judges), in three chapters.

V. KODASHIM (Holy Things): (1) *Zebaḥim* (sacrifices), in
fourteen chapters; (2) *Menaḥoth* (meat-offerings), in
chapters; (3) *Ḥullin* (Profane), laying down rules for slaughter
commonly *Ma'akhaloth* or common food), in twelve chapters;
Bekhoroth (the first-born of beasts and men).

Arakhin, commonly *Erkin* (on valuations, Lev.
2–33), in nine chapters; (5) *Temurah* (Lev. xxvii. 10, 33),
chapters; (6) *Keritoth* (not *Karetoth*), on the punishment
(excision), in six chapters; (7) *Me'ilah* (Num. v. 6–8), in
ter; (8) *Middoth* (dimensions of the temple and its courts
to Middoth, ii. 2), in five chapters; (9) *Tamid* (perpe
daily sacrifice), in seven chapters; (10) *Kinnim* (two species of bird-offerings), in three chapters.

VI. TOHOROTH (on Purifications): (1) *Kelim* (impurity of
in thirty chapters; (2) *Oholoth* (Num. xix. 14–16, &c.), in
chapters; (3) *Nega'im* (effects of leprosy in man, hou
garments), in fourteen chapters; (4) *Parah* (Num. xix.
twelve chapters; (5) *Tebul Yom* (supplement to purifica
chapters; (6) *Makhshirin* (preparations that render
Zabim (Lev. xv. 1–15), in ten chapters; (8) *Makhshirin*

Other records mention a fourth *Perek* or *Bikkurim*,
Rebbi Meïr, which is the Acquisition of the Law
on the *Mishnah*, however, is not to be found in either of the two *Perek*
to be his. Since the discovery of the MS. of the *Mishnah*
the second work above mentioned, as its title, &c., are very
conjectural.

[1] Compare the Psalmist's words, Ps. cxix. 126, *ʿeth laʿasoth laYahweh*
heferu Torathekha.

[2] On the supposed absence of *Massekhtoth Sedarim* previous
Kodashim see Schiller-Szinessy's *Catalogue of Hebrew MSS.*
Cambridge Collection, vol. ii. pt. 1, pref.

[3] In the above-named MS. Add. 170. 1 *Massekhtoth Nezikin*
contains, however, only thirty chapters; compare the
Kallah, leaf 102*a*, *Hadrash Zarnah Tza*, and *Mo'ed Shemini*
[4] See p. 503, note 16.
[5] Also known under *Sheḳalim Ḳadmonim*.

sing for the contraction of impurities, Lev. xi. 34), in six ; (9) *Zabim* [illegible] xv. 2–30, in five chapters; (10) *Tebul* [illegible] chapters; (11) *Yadayim* (purification and [illegible] chapters; (12) *'Okzin* (stalks, peel, &c., of three [illegible]

[illegible] editions of the *Mishnah*, whether as a book or [illegible] incorporated in the Babylonian Talmud are too [illegible] to be mentioned here. The *editio princeps* of the [illegible] book, appeared with Maimonides' code at Naples in 1492 (see Maimonides), and that as [illegible] in the Babylonian Talmud at Venice in 1520–23, both [illegible]. A part of the Palestinian Talmud the *Mishnah* came at Venice, in 1523–24, folio. This Talmud, however [illegible]ective, its *Mishnah* naturally is incomplete, too (and it is moreover, "corrected" by the scribe of 1288–89 [illegible]-Szinessy, *Occasional Notes*, &c., pp. 8–11). The [illegible] the University Press of Cambridge have therefore laid the public under considerable obligations by publishing for the [illegible] the complete original *Mishnah* on which the Palestinian [illegible]s, from the unique MS. preserved in the University

Translations. There exist translations of the *Mishnah* in German and English. (1) There is a Latin translation by [illegible]ers Abendana (R. Ya'akob and R. Yitshak). The former [illegible] (*Hakham*, i.e., chief rabbi) of the Sephardim in [illegible], and the latter was teacher of Hebrew and Rabbinic at [illegible] and Oxford successively. Both brothers, correspondents of Buxtorf, were fine Hebrew and Latin scholars (see Zunz, "The Abendana's," in *Israelitische Annalen* of December [illegible]). This translation is preserved in the Cambridge University Library MS. Mm. 1. 4. 8. (2) The Abendanas' version was [illegible]enhusius when he compiled, from old and new materials, his Latin translation, which appeared (with the text of the [illegible] and the translation also of the commentaries of Maimonides and "Bertinoro") at Amsterdam in 1698–1703, folio. The [illegible]btedness of Surenhusius to the Abendanas is a fact either [illegible] to or ignored by the bibliographers.[1] (3) A German [illegible] by Rose came out in German letters at Onolzbach in [illegible]to. (4) The version last named was in the possession of [illegible]onymous author of the translation, printed in Rabbinic [illegible] the Vienna edition of the *Mishnah* with the commentary of [illegible]*bach*, 1817–35, 8vo. This author (or editor) silently [illegible] the work of his predecessors. (5) Both these translations, [illegible]ssed in German diction, as well as in correctness of [illegible], by that which came out in Hebrew square letters at [illegible] 1832–34, 4to. and which, no doubt, belongs to J. M. [illegible]storian. (6) The English translation which came out at [illegible]n 1843, 8vo, by De Sola and Raphael, extends only over [illegible] treatises.

Commentaries. The commentaries on the *Mishnah* are [illegible] numerous as the editions, and cannot therefore be specifically enumerated here. The principal and the oldest, however are the following. (1) The two Talmuds themselves, of which of course the Babylonian is the only (and that but comparatively) perfect one or at all events the more extensive of the two. It has, however, to be stated, first, that the Palestinian Talmud [illegible]ers on the whole order *Zera'im*, while the Babylonian [illegible] the first "treatise" only of that order (*Berakhoth*); secondly, that the *Gemarath Shekalim* in the Babylonian [illegible]s only borrowed from the Palestinian Talmud. (2) The [illegible]aries on *Zera'im*, *Taharoth*, &c., by Rabbenu Hai Gaon, the [illegible]et, most learned, and in every way noblest of the [illegible]. He flourished in the 10th and 11th centuries. Part of the [illegible]aries, that on *Taharoth*, has appeared in the collection [illegible]

[illegible] W. H. Lowe's critical edition of this grand work (*The [illegible] of the Palestinian Talmud*, 1883, [illegible]

[illegible] Perreau (*Sketches of Anglo-Jewish History*, London, [illegible]; R. Yitshak Abendana translated the *Mishnah* and [illegible] Maimonides and "Bertinoro" also into Spanish [illegible] was executed in by [illegible] great work by the books and [illegible] Genesis on *Berakhoth*, *Peah*, *Demai*, *Kil'ayim*, *Shebi'ith*, [illegible], and *Ma'aseroth*; Schmid on *Shabbath* and *Pesahim*, [illegible] (*Rosh Hashshanah*); Laud (*Ta'anith*), Otho (*Shekalim*), [illegible] (*Sotah*), [illegible] *Megillah*, Fagius (*Aboth*), Arnoldi [illegible] L'Empereur *Horayoth*, and Ulmann (*Zebahim* and *Kare*[illegible]). But without the [illegible] Surenhusius could never have [illegible]ed, much less executed the great task he had before him. [illegible] the probability that the missing parts of the Palestinian [illegible] will one day come to light somewhere in the East, see Schiller-[illegible] in the *Academy*, February 23, 1878, *Hat-Chaim*, xi.; and [illegible]nder, *Handschriften-Verzeichniss der Königlichen Bibliothek* [illegible]n., &c. (1878, 4to), p. 65, where a piece of Palestinian [illegible] *'Okzin* is actually quoted.

[illegible] also a poet of no mean calibre. See his *Musa Hasdel* [illegible]*khel*), *ed. princ.* Fano, 1505 (?), 4to.

Kobets Mi'aseh Yad Ovadi'a, &c. (Berlin, 1856, 8vo). (3) The commentary on various treatises of the B. Talmud, and indirectly on the *Mishnah*, by Rabbenu Gershom Meor Haggolah (the "Light of the *Diaspora*," who flourished in the 10th and 11th centuries). Fragments of this commentary are incorporated in the ordinary Talmud editions (see e.g., *Nedarim*, 22b, &c.), but the greater part lies as yet in manuscript in various libraries. (4) The commentary of Rabbenu H[illegible], [illegible] at Kairawan (in Africa) in the 10th and 11th centuries. His commentary on the Talmud, and thus indirectly on the *Mishnah*, is now being published in the Vilna edition of the Babylonian Talmud. (5) The commentary of Rashi (*ob.* 1105) in all those parts of the B. Talmud on which that "prince of commentators" wrote. Here ought to be mentioned also the separate *editio princeps* of this commentary as far as the *Mishnah* is concerned, which appeared at Leghorn in 1653–54, 8vo. (6) The supplements and additions to the commentary of Rashi by his son-in-law Rabbenu Yehudah b. Nathan (*e.g.*, T. B., *Makkoth*, 19b, &c.) and by his grandsons: Rabbenu Shemuel b. Meir (*vulgo* Rashbam, see *Pesahim*, 99b, and *Baba Bathra*, 29a, &c.) and Rabbenu Shemayah b. Simhah of Vitri,[2] who interpreted the *Massekheth Middoth* before Rashi, his grandfather (see Schiller-Szinessy, *Catalogue of the Hebrew MSS.* preserved in the University Library of Cambridge, pp. [illegible]). (7) The commentary on the whole *Mishnah* by Maimonides (*q.v.*). (8) The commentary by R. Abraham b. David of Posquieres (*vulgo* Rabad) on *'Eduyyoth* (see editions of the B. Talmud, *Avodah Zarah* (with two other commentaries by Rabbenu Zerahyah Halla'ri and R. Asher b. Yehiel, Constantinople, 1731, folio), and on many other *Mishnayyoth* of the orders *Zera'im* and *Tohoroth* (in his "structure," on Maimonides, *Mishneh Torah*, books *Zera'im* and *Toharah*). (9) The commentary of R. Shimshon of Sens (who, like the foregoing, was a contemporary and opponent of Maimonides) on the orders of *Zera'im* (with supplements taken from the works of the somewhat older R. Yitshak b. Malkitsedek) and *Toharoth*.[3] (10) The commentary by R. Meir of Rothenburg (the celebrated captive of Rudolph of Hapsburg); see under (13) below. (11) The commentary by R. Asher b. Yehiel (a disciple of the foregoing, who died at Toledo in 1327) on twenty-one treatises of the orders I. and VI. (12) The commentary on the whole *Mishnah*, by Rabbenu 'Obadyah b. Bertinoro (flourished in the 15th and 16th centuries), the editions of which are very numerous. (13) The commentary on the whole *Mishnah*, by R. Yomtob Lipmann Heller (flourished in 16th and 17th centuries). This famous teacher, called in some of the greatest congregations of the Jews (Prague, Vladimir, and Cracow), incorporated much of the commentary of R. Meir of Rothenburg, compare under (10).

(4) *Works Secondary and Introductory to the Mishnah.*—These may be summed up under the word *Mathnitha*. *Mathnitho* is ostensibly the Aramaic equivalent of the Hebrew *Mishnah*; in reality, however, it signifies and comprises, not merely everything which is understood under that name, but also *Boraitho* (in full, *Mathnitha Boraitho*), *i.e.*, four other works of the oral law, and many literary notices of Mishnic and pre-Mishnic times besides, which are scattered throughout the Talmuds and other early Rabbinic works.

The first of these is *Tosephta*. As its name indicates, *Tosephto* is "Addition," *i.e.*, to the canonical *Mishnah*. All *Mishnah* teachers from time immemorial, notably R. 'Akibah and R. Yehudah Hannasi, left out, when they taught *Mishnah*, a large mass of kindred and explanatory matter, which they only occasionally and supplementarily mentioned, *i.e.*, when absolutely wanted. The chief collection of this additional matter, not incorporated in the system of the canonical *Mishnah*, is called *Tosephth* in Hebrew and *Tosphto* (or *Tosiphta* as some less correctly write it) in Aramaic. The Aramaic singular and the Hebrew plural occur already in the Talmuds and *Midrashim*.[10] *Tosephto* shares with the *Mishnah*, which it enlarges and explains, the number of orders and treatises, but not that of chapters, of which it has only 452. The oldest collection of Tosephtic matter, even as the oldest collection of Mishnic matter, is due to R. 'Akibah. But, whilst

---

[1] In the synod called together by Rabbenu Gershom, among several "ordinances" was also one that no Jew is allowed to marry more than one wife.

[2] His commentary on *Pesahim* appeared at Paris in 1868, and that on *Megillah* at Leipsic in 1876, both in 8vo.

[3] These writers (together with Rabbenu Meir another son-in-law and Rabbenu Ya'akob another grandson of Rashi) are the first of the so-called Tosaphists, whose activity continued down to the early part of the 14th century.

[4] Whether the commentary on *Tamid* printed under his name, together with that of R. Asher b. Yehiel on the same treatise (Prague, 1725, 4to), is really his is still matter of dispute.

[10] See T. Y., *Shabbath*, viii. 1, &c.; T. B., *Synhedrin*, 86*a* and elsewhere; *Midrash Rabbah* on Ecclesiastes v. 8, &c. There can be little doubt that in some places the word תוספתא ought to be transliterated *Tosephthe* (*i.e.*, as plural).

ah, as a work, was first sifted by his disciple R Meir, s a work, was first sifted by another disciple R. Nehemyah; s R. Meir's *Mishnah* was sifted again by *Rabbi* and others and was not written down before the 6th century, so as sifted again by R Hiyya, R. Hosha'yah, and others, ot written down in its entirety before the 6th century onder, then, that it now contains matter of a considerably *Tosephta* is not merely of great help for understanding *ah*, which is, in a certain sense, incomplete without it, precise and exact knowledge of Jewish archæology and ces, and in its Agadic parts, of which there are many, for Scriptures also. Here ought also to be mentioned *Both Nathan*, which is, no doubt, *Tosephta* to the *Mechoth* of *osephta* used to be printed till within the last forty years endix to the *Raph*, *i.e.*, the *Halakhoth Rab Alfes* a m of the Talmud by R. Yitzhak b Ya'akob Al Fasi, *i.e.*, of Fez, *ob.* 1103, which appeared first with this at Venice, 1521–22, folio. Here however, it was not ically or printed with even ordinary care. But in the ation of the Babylonian Talmud (1860–72) it came out, t time, worthily after a MS till then uncollated which ed in the Court Library. Dr Zuckermandel has since it from the Erfurt and Vienna MSS., with collation. A slation of *Tosephta* (with the Hebrew text) is to be found, name of *Tosaphta*, in Blasius Ugolinus's *Thesaurus um Sacrarum* (xvii. xx.). It comprises, however, only *Zera'im*, *Mo'ed*, and *Kodoshim*, and came out at Venice 1755–57, folio.

ond of these pieces of literature is *Mekhilta*. The word maic equivalent of the Hebrew *Middah* (measure), and ches mould, form, *i.e.*, of Scriptural exegesis, notably of rts of the Pentateuch. As such it might, of course, ny kind of commentary on any book of the Pentateuch, been composed by any one. And we find, indeed, that ignified at one time a commentary on the books Exodus, Numbers, and Deuteronomy, either by R. Yishma'el or by n,[3] at another time a commentary on Exodus, by R. . Yohai,[4] and at another time again a commentary on the books of Moses, by (Shime'on) Ben 'Azzai.[5] *Mekhilta* ver, means a commentary on the greater part of Exodus, R. Yishma'el (flourished in the 1st century) although, this teacher cannot have been the author of the book. his name is more than seventy times mentioned in it n why the ancient called the book by his name is, no anse the first words of the real work are *Amar Rabbi*. Like the other works of the "oral law," *Mekhilta* was n down before the 6th century, a fact which accounts rt at least, for the loss of several portions of this commentary, which, at present, only extends from xii. 1 to xxv. 3, al gaps between. That *Mekhilta* was once fuller than it know, not only from a statement made by Maimonides, but from a MS. (Add. 704, 1, in the University Library, dge, leaf 40*b*, where an extract is given by a Franco thor of the 12th or 13th century. The Talmud knows *Mekhilta*, and actually quotes *Baraithoth* (non-canonical *th*) which are to be found in our book, and yet the *khilta* can scarcely have been known to the teachers of d. *Mekhilta* is by some called *Midrash* and by others both names are in a certain sense correct. It is *Mid* stance, inasmuch as it contains exegesis, and in form, as it is subdivided into *Parshiyyoth* and follows the order iptural verses. But it is *Mishnah* in substance, inasmuch not only deals with the groundwork of the *Mishnah*, ts of *Baraithoth* (non-canonical *Mishnayoth*), and in much as it is, like the canonical *Mishnah*, divided into *h*. These latter are nine in number, and are called re- (1) *Dephusha* (with 18 *Parshiyyoth* and 1 *Pethihta* or n), (2) *Beshallah* (with 6 *Parshiyyoth* and 1 *Pethihta*), *tha* (with 10 *Parshiyyoth*), (4) *Vayassa'* (with 6 *Par-* (5) *'Amalek* (with 2 *Parshiyyoth*), (6) *Yithro* (with 2 *h*), (7) *Bahodesh* (with 11 *Parshiyyoth*), (8) *Nezikin* and th 20 *Parshiyyoth*), and (9) *Shabbetha* (with 2 *Par-* 1 in the pericope *Ki thissa* and 1 in that of *Vayaqhel*). was published first at Constantinople in 1515, under f *Sepher Haamekhilto*, and in 1545 at Venice as *Mal mekhilto*. In 1712 it appeared at Amsterdam with a y. In 1744 it appeared again at Venice with a Latin by Blasius Ugolinus (*Thes. Antiq. Sacr.*, xiv.). In 1801 at Leghorn with a different commentary. In 1844 it came out at Vilna with a new commentary. All these are in folio. The best and cheapest editions with commentaries are those by Weiss (1865) and Friedmann (1870), both printed at Vienna, and in 8vo.

The third of these pieces of literature is *Siphro*. Both Leviticus itself, because it is the most difficult of all Mosaic books, and the oldest Rabbinic commentary on it, because it is the most difficult of all commentaries on the Scriptures, have been from time immemorial known under the name of *Siphro* (*i.e.*, *the* Book)[6] This book and this commentary are also called *Torath Kohanim*, and the former is spoken of in the Talmud already as *Siphro dibbi Rabbi*. This latter expression has led many great men (among others Maimonides[7][8] to ascribe the authorship of the commentary to Rab (Abba Arikha, a nephew and disciple of R Hiyya). But such a view is erroneous in the extreme, as the book is, so far as form and substance go, both older and later than Rab, paradoxical as the statement may appear. It is older in its origin and in its matter, for not merely do all the anonymous *Baraithoth* which are to be found in it belong to R Yehudah b Ilai, a teacher of the 1st century, but one of the sons of Rabbi (of the 2d century) had actually taught another rabbi two thirds of a third, *i.e.*, two months, of this work.[9] It is later than Rab, for in it are found one "authority" and several "results" of much later date than that of this great Babylonian teacher.[10] The fact is, the word *Rab* in the phrase *Siphro dibbi Rab* is not a proper name at all, but simply stands for "teacher," and *dibbi Rab* thus signifies "of a school," a term used for any teacher and any school of any time. Although most of the *Baraithoth* which it contains are as old as the 1st century, the book as such cannot have been written down earlier than the 6th, in accordance with the treatment, in this respect, of all the other Halakhic works of the "oral law." *Siphro*, although it bears on the pericopes and verses of Leviticus, and is on account of this fact by many called a *Midrash*, is in reality *Mishnah*,[11] a name borne out by the nature of its contents, which are mostly Mishnic, and sometimes represent actual canonical *Mishnayoth*. *Siphra* exhibits a curious conglomeration of matter. It opens with the "Rules of the Interpretation of Scripture," ascribed to R Yishma'el, a *Baraitha* which, although important in itself, is not more important for this than for any other commentary on the Pentateuch. And this conglomerate nature shows itself even more strikingly in form; for *Siphra* contains as forms of division *Dibburim*, *Mekhilta*, *Parshiyyoth* (some of which mean pericopes, whilst others mean chapters), *Perakim*, and *Pisqoth*. All this points, of course, to various divisions of the book made at various times. Whilst none of these divisions can be later than the 12th century,[12] the earliest is at least as old as the 2d, and belongs perhaps to the 1st.[13] *Siphra* is chiefly of importance for the understanding of the *Mishnah* of the orders *Kodoshim* and *Toharoth* (which were, no doubt, the earliest *Mishnayoth* put into "order"); but, whilst it is a sure help for the *Mechoth*, the *Mishnah* is no sure help for it. *Siphra* is a genuine specimen of the "oral law," inasmuch as it cannot be mastered without a teacher. Owing to the difficulty of understanding it, *Siphra* has not been often studied, and consequently not often printed. The *editio princeps* is of 1545, the second edition with the commentary *Korban Aharon* is of 1609–11, both at Venice. The third edition with the just-named commentary is of 1702, and came out at Dessau. The fourth edition, with a Latin translation, is to be found in Blasius Ugolinus's *Thesaurus Antiquitatum Sacrarum*, &c., Venice, 1744–69, vol. xiv. All these are in folio. The fifth edition, with the commentary *Torath Kohanim* (vol. i.), appeared at Vilna, 1845, 4to. The sixth edition, with the commentary *Derech Hayyim*, appeared at Lemberg, 1848, folio. The seventh edition with the commentary *Hattorah Vehaa Mitsvah*, appeared at Bucharest, 1860, 4to. The eighth edition, with the commentary of R. Abraham b. David of Posquières, &c., appeared at Vienna, 1862; and the ninth edition, with the commentary by R. Shimshon of Sens, appeared at Warsaw, 1866, both in folio. Siphro.

The fourth of these pieces of literature is *Sipherê*. *Sipherê*, or *Sipherê Sipherê dibbi Rab*, which in earlier times certainly included the oldest Rabbinic commentaries on Exodus, Numbers, and Deuteronomy (and perhaps also that on Leviticus), means now the oldest Rabbinic commentary on the last two books of Moses only.

---

n the order *Zera'im* came out at Vilna in 1799, 4to; but ety it came only out between 1837, 1841, and 1871, folio. at Pasewalk and Treves from 1877 to 1882, 8vo.

imonides's preface to the *Mishneh Torah*.

manides's commentary on the Pentateuch (on Gen. xlix. 31)

hasin Hasshalem (ed. Filipowski, London and Edinburgh, p. 30, col. 2.

[6] See T. B., *Berakhoth*, 18*b*, and Rashi, *in loco*. The *Sipherê* said here to have been studied by Benaiah the son of Jehoiada may well have been our Leviticus, though of course it cannot have been the *Sipherê* with which we are here concerned.

[11] It, or rather its founder (R. Yehudah b. Ilai) identifies *Mishnah* and *Midrash*, T. B., *Kiddushin*, 49*a*.

[12] They were known to R. Abraham b. David (Rabad).

[13] T. B., *Kiddushin*, 33*a*.

Both book [illegible] *Derech Eretz* [illegible], of which *Sophrim* on Numbers [illegible] that on Deuteronomy has 357. The ancient division [illegible] *Sedarim* cannot now be accurately traced. The Sedarim now at Numbers vi. 1, and goes to the end of [illegible]. The pieces accordingly given in [illegible] by the Babylonian Talmud to R. Shimeon b. Yohai [illegible] disciple of R. Akiba, and the reputed author [illegible] Enough to [illegible] no doubt the virtual author of [illegible] *Tikkun Sedarim*, which [illegible] to be found at the com[illegible] to usually-specified author. For, in the [illegible] not only repeatedly name[illegible] the book, but even [illegible] to other [illegible], and, [illegible] that are [illegible] anonymously, even, in the book which can only [illegible] Talmudic study, [illegible] comments to [illegible] composition of the Talmud. The fact that *Midrash*, [illegible] work of the [illegible] boy," was not written down [illegible] It [illegible] to be mentioned here that the [illegible] Hin[illegible] [illegible] century, and even somewhat [illegible] which they variously designate [illegible] *Beraita*, *Tosefta*, *Sifra*, *Sifre*, *Mekilta*, *Pesikta*, *Midrash* [illegible] *Yelamdenu*. To quote from the [illegible] which have [illegible] text, that would must not only have been of much later date, but it would be less valuable than the work [illegible] *Yelamdenu* referred to, the latter [illegible] and with a Latin translation by Ecchellensis, under the title *Mosis Maimonidis Liber Misnae*, Amst. 1701, folio; Venice, 1703, folio; and in 1709. The third edition appeared at Hamburg in 1761, and the fourth at Sudylkow in 1802, both in 8vo. The latest edition, with the commentary of *Tif'eret Yisrael* appended in two volumes, of which the first was printed at Dyhernfurt in 1811 and the second at Rodowill in 1820, both in folio. There is also a Hebrew translation of Maimonides' text, by Moses Narboni, and the seventh edition of Venice, 1566, both in 8vo.

There is also a fifth piece of Midrashic literature known specially by the name *Midrash*. Besides the *Midrashim* contained in the *Talmuds*, *Midrash Sepher*, and *Midrash Sepharim*, there are hundreds of other *Midrashim* to be found scattered about in both Talmuds. The most, however, most important of the vast *Midrash* consists of Midrashic works composed by Rabbi Kappara, Rabbi Hoshaya, and hundreds of other teachers, which in course of time must have perished. There is, however, enough left of the *Midrash* canonical and non-canonical, to prove the correctness of the Cabbalistic axiom that *Midrash* is the equivalent of *Yesh Sheesh* and *Yesh*. This axiom is based on the fact that the two words (מישה: מישה) accidentally consist of the same letters, and further on the communication of immediate truth, what the soul *Midrash* is to the body, the *Midrash* is to Mosaism. The soul gives life to the body, and the *Midrash* gives life to the Pentateuch. "For the letter killeth, but the spirit giveth life." (M. S.)

MISKOLCZ, capital of the Cis-Tibiscan county of Borsod, Hungary (48° 6′ N. lat., 20° 49′ E. long.), is picturesquely situated in a valley watered by the Szinva, 90 miles north-east from Budapest, with which, as also with Debreczen and Kassa (Kaschau), it is directly connected by railway. Miskolcz is one of the most thriving provincial towns in the kingdom, and has many fine buildings, including Roman Catholic, Greek Catholic, Lutheran, and Calvinist churches and school, a Minorite convent, synagogue, Hungarian theatre, hospital, royal and circuit courts of law, district and town offices, and the administrative bureaus for the county. There are manufactories of earthenware, porcelain, boots and shoes, and paper, woollen, leather, and both steam and water mills. The trade is chiefly in corn, wheaten flour, wine, fruit, cattle, honey, wax, and the agricultural produce of the neighbourhood. The great fairs, held five times a year, are much resorted to by strangers from a distance. Not far from the town are stone quarries and iron mines. At the end of 1880 the entire population amounted to 24,343, of whom the majority were Magyars by nationality.

During the 16th and 17th centuries Miskolcz suffered much from the desolating hordes of Cossacks who then ravaged the country, and also from the [illegible] Protestant princes and leaders, especially those of Transylvania and Hungary. In 1781, 1813, and 1847 it was [illegible] by fire, and on the 30th August 1878 a great portion of the [illegible] was destroyed by a terrific storm. See HUNGARY, vol. xii. [illegible].

MISREPRESENTATION. See FRAUD.

[2] According to T. B., *Hagigah*, 14b, there used to be at one time no less than [illegible] or seven hundred *Midrash* orders.

MISSAL,[1] the book containing the liturgy, or the mass, of the Latin Church. This name (*e.g.*, Gothicum, Francorum, Gallicanum Vetus) began to [illegible] the older word *Sacramentary* (Sacramentarium, Sacramentorum) from about the middle of the 8th c. At that period the books so designated contained the fixed canon of the mass or consecration (actionem, precem canonicam, canonem actionis), variable collects, secrets or orationes super oblata, and post-communions for each fast, vigil, festival, of the ecclesiastical year, for a due celebration of Eucharist they required accordingly to be supplemented other books, such as the *Antiphonarium*, afterwards the *Gradale*, containing the proper antiphons (introits, responsories (graduals), tracts, sequences, offertories, communions, and other portions of the communion designed to be sung by the schola or choir, and the *Lectionarium* (or *Epistolarium* and *Evangelistarium*) with the lessons. Afterwards missals began to be prepared, containing more or less fully the antiphons and lessons as the prayers proper to the various days, and these were *missalia plenaria*. All modern missals are of this description. The *Missale Romanum ex decreto SS. Tridentini restitutum*, now in almost exclusive use throughout all the churches of the Latin obedience, owes its present form to the council of Trent, which among its other [illegible] undertook the preparation of a correct and uniform missal, and entrusted the work to a committee of its members. The committee had not completed its labours when the council rose, but the pope was instructed to receive it when ready and to act upon it. The "reformed" missal accordingly was promulgated by Pius V. on July 14, 1570, and its universal use enjoined on all branches of the Latin Church, the only exceptions allowed being in the case of churches having local and independent liturgies which had been kept in unbroken use for at least two centuries. It has subsequently undergone slight revision under Clement VIII. (1604) and Urban VIII. (1634); and a few new masses, both obligatory and permissive, universal, have been added by the competent authority. Although the Roman missal is very much larger in bulk than any other liturgy, it need hardly be explained that the [illegible] office to which it relates is not in itself more than one. By much the greater part of it is contained in the "ordinary" and "canon" of the mass, usually printed about the middle of the missal, and occupies, though in large type, only a few pages in any printed copy. The work owes its bulk and complexity to two circumstances. On the one hand, in the celebration of the sacrifice of the mass practically nothing is left to the impulse or discretion of the officiating priest, everything—what he is to say, the tone and gestures with which he is to say it, and colour of the robe he is to wear—is carefully prescribed either in the general rubrics prefixed to the text, or in the numerous rubrics which accompany it.[2] On the other hand, the Roman, like all the Western liturgies, is distinguished

[1] *Missa*, *Liber*, *Missale*, from *Missa*; see vol. xviii.

[2] The English missal consequently continued to be used by Catholics until towards the end of the 17th century, when it was superseded by the Roman through Jesuit influence. The Sarum held its ground until much more recently, but has always been under the Ultramontanism of the bishops.

In all the older liturgies the comparative absence of [illegible] rubrics is very perplexing. It is very noticeable in the Roman *Secreta*, but the want is to some extent supplied by the very detailed directions for a high pontifical mass in the texts of the *Ordo Romanus* mentioned below. That there was an absolutely fixed set of rubrics in use in France during the 8th century is shown by the fact that each priest was required to write an account of his own practice ("libellum ordinis") and present it for approbation to the bishop in Lent (see Baluze, *Cap. Reg. Franc.*, ii. 824, quoted in Smith's, *Dict. of Chr. Antiq.*, ii. 1521).

those of the Eastern Church by its flexibility. by conscious effort, no doubt, but partly also by accident, a well marked distinctive character has given in one or all of the above mentioned respects office for each ecclesiastical season, for each fa t or l of the year, almost for each day of the week, and on has also been made of a suitable communion ser r many of the special and extraordinary occasions both ic and of private life. This richness of variety is seen y in the collects but also in the lessons and antiphonal f the service, passages of Scripture in the selection and tion of which an exquisite delicacy of religious and ic instinct has been for the most part strikingly shown different parts of the Roman communion office are of the same antiquity. Its essential and characteratures are most easily caught, and their rationale derstood, by reference to the earliest *Sacramentaries* ularly the Gregorian, which was avowedly the basis labours of the Tridentine committee), to the ian *Antiphonary*, and to the oldest redaction of the *Romanus*.[1] The account of the mass (qualiter Missa celebratur) as given by the *Sacramentarium* is to the effect that there is in the first place *Introit* according to the time, whether for a festival a common day, thereafter *Kyrie Eleison* (In on to this *Gloria in Excelsis Deo* is, and if a bishop celebrant], though only on Sundays and festivals, priest is by no means to say it, except only at tide. When there is a litany (quando letania agitur *Gloria in Excelsis* non *Alleluia* is sung.) After the *Oratio* is said, whereupon follows the *Apostolus*, e *Gradual* and *Alleluia*. Afterward the *Gospel* i Then comes the *Offertorium*,[2] and the *Oratio super* is said." Then follow the *Sursum Corda*, the *Pre anon*, Lord's Prayer and "embolismus (ἐμβολισμός ertion, *Libera nos*, *Domine*), given at full length ly as they still occur in the Roman missal very liturgy of all the five groups a passage similar s occurs, beginning with *Sursum Corda*, followed *Preface* and the recitation of the *Sanctus* or e Hymn. The "canon" or consecration prayer, in all of them comes immediately after invariably s our Lord's words of institution, and (except in the ian liturgy) concludes with the Lord's Prayer and olism." But within this framework there are certain ces of arrangement, furnishing mark by which the s groups of liturgies can be classified (see vol. xiv. sq.). Thus it is distinctive of the liturgy of dem that the "great intercession" for the quick and d follows the words of institution and an Epiklesis (περὶς τοῦ πνεύματος ἁγίου) or petition for the descent Holy Spirit upon the gifts; in the Alexandrian the intercession" has its place in the *Preface*, in the yrian it comes between the words of institution and iklesis; in the Ephesine it comes before the *Preface*, n the Roman it is divided into two, the commemoration the living being before, and that of the dead after, rds of institution. Other distinctive features of the liturgy are (1) the position of the "Pax after the ation, and not as in all the other liturgies at a very stage of the service, before the *Preface* even, and absence of the Epiklesis common to all the others.

The words of its "canonical prayer" are of m antiquity: they are found in the extant manuscript *Sacramentarium Gelasianum*, and were already old forgotten authorship in the time of Gregory the Gre in a letter to John, bishop of Syracuse (*Registr. Ep* 64), speaks of it as "the prayer composed by a "scho (precem quam scholasticus composuerat). The letter is interesting as containing Gregory's defence, ground of ancient use, of certain parts of the Rom to which the bishop of Syracuse had taken exce merely borrowed from Constantinople. Thus we that, while at Constantinople the *Kyrie Eleison* wa all simultaneously, it was the Roman custom for the to repeat the words first and for the people to r *Christe Eleison* being also repeated an equal num times. Again, the Lord's Prayer was said imm after the consecration aloud by all the people and Greek, but at Rome by the priest alone.

The somewhat meagre and imperfect liturgical furnished by the *Sacramentarium Gregorianum* are mented in a very full and interesting manner by the sive texts of the *Ordo Romanus*, the first of which from about the year 730. The ritual they enjoin for a pontifical high mass in Rome it is, but the diffi to be observed by a priest "quando in titulo facit are comparatively slight. Subjoined is a precis *Romanus I.*

It is first of all explained that Rome has seven eccle regions, each with its proper deacons, subdeacons, and Each region has its own day of the week for high eccle functions, which are celebrated by each in rotation. This for the Station of S. Mariam Majorem, at S. Laurentium in S. Petrum, &c., prefixed to most of the masses in the *Sacramentaries*, and still retained in the "Propriums de Tem the Roman missal. The regulations for the assembling marshalling of the procession by which the pontiff is met, escorted to the appointed station are minutely given, as the adjustment of his vestments "at home (domi)," w secretly has been rehearsed. He does not receive the kiss of *Introit* has been begun by the choir in the church. Be *Gloria* he takes his seat at the altar, and after the *Kyrie* has been sung (the number of times left to his discre begins the *Gloria in Excelsis*, which is taken up by the choi ing the singing he faces eastward at its close he turns rou moment to say "Pax vobis," and forthwith proceeds to the This finished, all rest themselves in order while the ascends the ambo and reads [the *Epistle*]. After he has d cantor with his book (cantatorium) ascends and gives out the *Responsum* with the *Alleluia* and *Versus* in addition at th call for either. The deacon then silently kisses the fo pontiff and receives his blessing in the words "Dominus s tuorum [or later, tui]." Proceeding to the subdeacons with folded and subdeacon-hymnus) he ascends the ambo where th *Gospel*. At the close with the words "Per ill "Dominus vobiscum." The pontiff then recites the *Oratio*, to the "secretarium," a chapel at the extremity of the aisle and receives in order the oblations of the relevant oblationa puna: the archdeacon who follows relieves them (suscipi and pouring them into a large vessel, until all offerings are from the other side and stands apart with them, the bishop. This completed, the pontiff and subdeacons wash their ha offering—hence nowhere mentioned by the subdeacons on t and water supplied by the head of the choir in lumpar[1] being mingled with the wine. During the ceremony th have been engaged in singing the *Agnus Dei*, which the pontiff sends to them to stop and enter upon the *Preface*, deacon giving the response. At the Angelic Hymn eve kneel and continue thereafter except the pontiff, who r and begins the *Canon*. At the words "per quem haec o archdeacon fits the oblata with the oblate, and at "Per D super sublata" he serves the peace to the clergy in the and to the laity. The pontiff then breaks off a particle consecrated bread and lays it upon the altar; then a deac the paten held by the deacon. It is then that the *Diptycha* are read. The pontiff in communicating puts the host the cup, saying, "Fiat commixtio et consecratio corporis Domini nostri Jesu Christi accipientibus nobis in vitam a These present communicate in their order and the pe

[1] For the genealogical relationships of the Roman with other s, the reader is referred to the article LITURGY (vol. xiv. 706 ere some account is also given of the three *Sacramentaria* e doctrines involved in the "sacrifice of the mass," see ass, vol. viii. p. 650 *sq.*

[2] The editions do not mention the Offertory here.

[3] This was one of the points discussed at the council of Florence, dinal Bessarion for a time succeeded in persuading the Greeks up the Epiklesis.

ontiff descends into the senatorium to give the communion, la begins the communion *Antiphon*, and continues singing *m* until, all the people having communicated, they receive to begin the *Gloria*, after which, the verse having been peated, they stop. The celebrant, then, facing eastward, *Oremus* (*Complendum*, which being finished the arch ng of the people, "He ris a est," they responding with den.

mplete our idea of the Roman communion office as it to the end of the 8th century we must now turn to ecessian *Antiphonarius sive Graduale Liber ordinatus ndum anni*, which as its name implies contains those portions of the mass which were intended to be the schola or choir. It gives for each day for proper masses provided (1) the *Antiphona* (Anti d Introitum) and *Psalmus*; (2) the *Responsorium ersus*, with its *Alleluia* and *Versus*; (3) the *rium* and *Versus*; (4) the *Communio* and *Psalmus*. xplanation of each of these terms is necessary. (1) ord *Antiphon* (ἀντίφωνον, Old English *Antefn*, *Anthem*) in its ecclesiastical use has reference very ancient practice of relieving the voices of the by dividing the work between alternate choirs. In its most usual meaning it has the special significa a sentence (usually scriptural) constantly sung by ir between the verses of a psalm or hymn sung by . According to the Roman liturgiologists it was Celestine who enjoined that the Psalms of David be sung (in rotation, one presumes) antiphonally mass, in process of time the antiphon came to be the beginning and end only, and the psalm itself uced to a single verse. In the days of Gregory at the introit appears to have been sung precisely resent, that is to say, after the antiphon (proper *excellence*), the *Psalmus* with its *Gloria*, then the n again. (2) The *Responsorium*, like the Greek n, derives its name from the responsive manner of . As introduced between the epistle and gospel it bably at first a comparatively long passage, usually re psalm or canticle, originally given out by the from the steps from which the epistle had been ence the later name *Gradual*), the response being p by the whole choir. (3) The *Offertorium* and *nio* correspond to the "hymn from the book of " mentioned by early authorities (see, for example, me, *Ecc.*, ii. 11; *Ap. Const.*, viii. 13) as sung the oblation and also while that which had been was being distributed to the people. A very e connexion between these four parts of the choral can generally be observed, thus, taking the first in the ecclesiastical year, we find both in the *mary* and in the modern *Missal* that the antiphon xxv. 1–3, the psalmus Ps. xxv. 4, the responsorium ale) and versus Ps. xxv. 3 and xxv. 4, the offertorium sus Ps. xxv. 1–3 and Ps. xxv. 5. The communio lxxxv. 12, one of the verses of the responsorium . lxxxv. 7. In the selection of the introits there trace of a certain rotation of the psalms in the having been observed.

n 1 page of the modern Roman missal are occupied he *Calendar* and a variety of explanations relating year and its parts, and the manner of determin e movable feasts. The general rubrics (*Rubrica les Missalis*) follow, explaining what are the various of mass which may be celebrated, prescribing the of celebration, the kind and colour of vestments to d, and the ritual to be followed (ritus celebrandi), and giving directions as to what is to be done in various defects or imperfections which may arise. *raparatio ad Missam*, which comes next, is a short l of devotion containing psalms, hymns, and prayers to be used as opportunity may occur before and a celebration. Next comes the proper of the sea (*Proprium Missarum de Tempore*), occupying more t half of the entire volume. It contains the proper int collect (one or more), epistle, gradual (tract or sequen gospel, offertory, secreta (one or more), communion, post communion for every Sunday of the year, and for the festival and ferias connected with the ecclesiast season, as well as the offices peculiar to the ember d Holy Week, Easter, and Whitsuntide. Between the for Holy Saturday and that for Easter Sunday the ordin of the mass (*Ordo Missæ*), with the solemn and proper faces for the year, and the canon of the mass are inser The proper of the season is followed by the proper of saints (*Proprium Sanctorum*), containing what is spe to each saint's day in the order of the calendar, and by *Commune Sanctorum*, containing such offices as the mon of one martyr and bishop, the common of one ma not a bishop, the common of many martyrs in paschal t the common of many martyrs out of paschal time, and like. A variety of masses to be used at the feast of dedication of a church, of masses for the dead, and of v masses (as for the sick, for persons journeying, for bridegr and bride) follow, and also certain benedictions. missals have an appendix also containing certain masses of saints to be celebrated "ex indulto apostolic

Masses fall into two great subdivisions: (1) ordinar regular (secundum ordinem officii), celebrated accor to the regular rotation of fast and feast, vigil and feria the calendar. (2) extraordinary or occasional (extra ordi offices), being either "votive" or "for the dead," and the nature of the case having no definite time prescr for them. Festival masses are either double, half-do or simple, an ordinary Sunday mass being a half do The difference depends on the number of collects secretæ: on a double only one of each is offered, on a double there are two or three, and on a simple there be as many as five, or even seven, of each. Any may be either high (missa solemnis) or low (missa priv The distinction depends upon the number of officia clergy, certain differences of practice as to what is nounced aloud and what inaudibly, the use or absen incense, certain gestures, and the like. Solitary m are forbidden, there must be at least an acolyte to the responses. The vestments prescribed for the pries the amice, alb, cingulum or girdle, maniple, stole, chasuble (planeta), see COSTUME, vol. vi. p. 462. T are certain distinctions of course for a bishop or abbot. colour of the vestments and of the drapery of the altar v according to the day, being either white, red, green, vi or black. This last custom does not go much further than Innocent III., who explains the symbolism inten

Subjoined is an account of the manner of celebra high mass according to the rite at present in force.

1. The priest who is to celebrate, having previously confess necessary and having finished matins and lauds, is to seek l for private prayer (fasting) and to use as he has opportunit "prayers before mass" already referred to. How the robing sacristy is next to be gone about is minutely prescribed, and p are given to be used as each article is put on. The sacram elements having previously been placed on the altar or on a cre table, the celebrant enters the church and takes his stand the lowest step of the altar, having the deacon on his right an sub-deacon on his left. After invoking the Trinity (In n Patris, &c.) he repeats alternately with those who are with hi psalm "Judica me, Deus," which is preceded in the usual way antiphon (Introibo ad altare Dei), and followed also by the and Antiphon.[1] The versicle "Adjutorium nostrum," wi

[1] This antiphon is not to be confounded with the Antiphe Introitum further on. This use of the 43d Psalm goes as far b least as the end of the 11th century, being mentioned by Micr (1080). It is omitted in masses for the dead and during Holy

approved usage appears to be in that case that it is sung as
"Hosanna in Excelsis" before the elevation, and "Benedictus
t" is reserved till afterwards. In France it was a very com-
tom, made general for a time at the request of Louis XII., to
"salutaris hostia" at the elevation.

adores it (the bell meanwhile being rung).[7] The same
observed when the chalice is consecrated. Immediately be
Lord's Prayer, at the words "per ipsum et cum ipso et i
the sign of the cross is made three times over the chalice w
host, and towards the close of the "embolism" the fractio
host takes place. After the words "Pax Domini sit semp
cum" the emission of the particle into the cup takes pla
the words "Haec commixtio et consecratio," &c. The c
then says the Agnus Dei three times.

5 While the choir sings the Agnus Dei and the Commun
celebrant proceeds, still "secrete," with the remainder of th
which though printed as part of the canon is more conve
called the Communion and Post-communion. After the pr
the peace and unity of the Church ("Domine Jesu Chr
dixisti") he salutes the deacon with the kiss of peace, saying
tecum"; the subdeacon is saluted in like manner, and then
the "pax" to the rest of the clergy who may be assisting. T
himself communicates under both species with suitable
and actions and afterwards administers the sacrament to th
communicants if there be any. Then while the wine is pou
the cup for the first ablution he says, "Quod ore sumpsi
having taken it he says, "Corpus tuum, Domine." After th
ablution he goes to the book and reads the Communion. Th
ing to the people with "Dominus vobiscum" he reads th
communion (one or more), turning once more to the congreg
use the old dismissal formula "Dominus vobiscum" (*R.* Et
spiritu tuo, and "Ite, missa est" for "Benedicamus Dom
three masses from which "Gloria in Excelsis" has been
(*R.* Deo Gratias). Bowing down before the altar he offers th
"Placeat tibi sancta Trinitas," then turning round he ma
sign of the cross over the congregation with the words
benedictio ("Benedicat"[8]). He then reads the passage f
gospel of John beginning with "In principio erat Verb
else the proper gospel of the day."

MISSIONS. The history of Christian mission
for practical purposes, be best divided into three
periods (1) the primitive, (2) the mediaeval, a
the modern. None of these periods can be neglec
they have an intimate connexion with each oth
illustrate the activity respectively of individuals,
church in her corporate capacity, and of societies.

1. *The Primitive Period.*

Christian missions had their origin in the examp
the command of our Lord Himself (Matt. xxviii. 1
the unparalleled boldness on the part of the Fou
Christianity, which dared to anticipate for the Ch
faith a succession of efforts which should never c
cause its propagation to be undertaken as "a
and direct work," has been justified by the voice of hi
Whereas other religions have spread from coun
country as component parts of popular opinion
travelled with migration or conquest, have passed
train of things and by the usual channels of comm
tion, the first foundations of the church had hard
laid before individual missionary activity marked
of each one of the circle of the apostles.

Of the actual details of their labours we have be
mitted to know but little. Three only of the inn
followers of the Saviour have any conspicuous place
apostolic records, and the most illustrious in the
domain of missionary activity, St Paul, did not
to the original twelve. His activity took the f
journeys and voyages, chiefly to large towns, wh
message found a point of contact either with the
synagogue or the aspirations of the Gentile world
result of his labours and of those of his su

[1] The history of the practice of elevating the host is
obscure. It seems to have arisen out of the custom of hold
oblation, as mentioned in the *Ordo Romanus*, or also
elevation of the host, as at present practised, was not enj
Pope Honorius III. The use of the handbell at the elevatio
later, and was first made general by Gregory XI.

[2] The benediction is omitted in masses for the dead.

[3] The reading of the passage from John on days which h
proper gospel was first enjoined by Pius V.

[4] Dawson, *On Prophecy*, p. 278.

at toward the middle of the 2d century the had gradually extended its conquest through A Gaul, southern Gaul, and northern Africa a treatise history can tell but little of the church tenacity and the intimacy of many of the primitive enturies wrapped in hopeless darkness. Whatever ss of was due to the evangelizing labours of bishops and clergy who occupied themselves in ief cast of Aegean, and toiled zealously and ily in the bread of the church though having no ribed devotion. Among the most distinguished natives of this individual activity in the 4th and uries may be mentioned Ulfila, the Apostle of in about 360; Frumentius, a bishop of Abyssinia, 37; Chrysostom, who founded at Constantinople n institution in which Goths might be trained h the gospel to their own people; Valentinian, the of Noricum, about 440; and Honoratus, who from ns to home in the islet of Lerins, about 410, sent numerous labourers to southern and western Gaul, me the leading missionaries of their day among

of heathendom in the neighbourhood of Arles, Troyes, Metz, and Nice.

The Medieval Period

the 5th century the church found a very different proposed to her missionary energies and zeal pel of civilization had scarcely been planted when confronted with numberless hordes which had long othered out in their native wilds, and which ow precipitated over the entire face of Europe. for one time ceased to plead for toleration, and to be aggressive, she not only stood the shock of but girded herself for the difficult work of calming tated elements of society, of teaching the nations a faith than a coarse form of nature worship, of ze and reforming their restless independence, controllable love of liberty, and attuning them to members of an enlightened Christendom.

The Celtic Missionaries. The first pioneers who went n crusade in this difficult enterprise came from the l Celtic churches of Ireland and the Scottish nds, which, though almost lost sight of amid the ne contest which was to change the Roman world, n sooner founded than they sent forth swarms of to pour back upon the Continent the gift of ion and the gospel. Of many who deserve n connexion with this period, the most prominent Columba, the founder of the famous monastery of and the evangelizer of the Albanian Scots and n Picts; Aidan, the apostle of Northumbria ianus, the apostle of the Burgundians of the Vosges, er Gallus, the evangelizer of northeastern Switzerland Virgilius, the apostle of Thuringia, idpert, the martyr of the Black Forest. These three secular men at the head of ardent disciples to take the world by storm. Travelling comically poor and carrying a simple outfit, these Celtic ries chose themselves on the Continent of Europe, and, ation with reproduction at Annegray or Luxeuil the ion boat-shaped hut, the chapel and the round tower, they had left behind in Derry or in the Island of Hy, raved the dangers of the northern seas, and penetrated as far as the Faroes and even to distant Iceland.[1]

The Pagan Missionaries. Thus they laid the tions, awing the heathen tribes by their indomitable of self sacrifice and the sternness of their rule of life.

But, marvellous as it was, their work lacked the of permanence, and it became clear that if Europe be carried through the dissolution of the old society nissionary operations consolidated, a more practical must be devised and carried out. The men for this were now ready. Restored to the commonwealth of by the labours of the followers of Augustine of Cant and the Celtic missionaries from Iona, the sons newly evangelized English churches were ready to go to the help of their Teutonic brothers in the C forest. The energy which warriors were accustomed put forth in their efforts to conquer was now "exhibited the enterprise of conversion and teaching." By Wilfrid the court of England, by Willibrord in the neighbourhood of Utrecht, by the martyr brothers Ewald or E among the "old" or continental Saxons, by Sw the apostle of the tribes between the Ems and the by Adelbert, a prince of the royal house of Northu in the region north of Holland, by Wunsing, a na England, and one of the disciples of Willibrord, some region, and last, not least, by the famous W of Boniface, the "Apostle of Germany," who went first to assist Willibrord at Utrecht, then to labo Thuringia and Upper Hesse, then, with the aid kinsmen Wunibald and Willibald, their sister Wa and her thirty companions, to consolidate the w earlier missionaries, and finally to die a martyr shore of the Zuyder Zee.

(c) *Scandinavian Mission.* Devoted, however, a the labours of Boniface and his disciples, the battl not yet nearly won. All that he and they and the e Charlemagne after them achieved for the fierce un world of the 8th century seemed to have been done when, in the 9th, "on the north and north we pagan Scandinavian were hanging about every coa pouring in at every inlet, when on the east the Hungarians were warming like locusts and deva Europe from the Baltic to the Alps; when on the and south-east the Saracens were pressing on and c their victorious hosts. It seemed then as if every life were choked, and Christendom must be stifle smothered in the fatal embrace."[2] But it was eve that one of the most intrepid of missionary ente was undertaken, and the devoted Anskar went fo proved himself a true apostle of Denmark and S sought out the Scandinavian viking in his native ho icy lands, and after persevering in the face of app insurmountable difficulties and hardships, handed torch of self-denying zeal to others, who "casting bread on the waters" saw, after the lapse of many the close of the monotonous tale of burning churche pillaged monasteries, and taught the fierce North lay aside his old habits of piracy, and gradually respect for civilized institutions.

(d) *Slavonic Missions.* Thus the "gospel kingdom" was successively proclaimed to the Rom Celtic, the Teutonic, and the Scandinavian wor conquest, still more stubborn remained with the S tribes, with their triple and many-headed divinitie powers of good and powers of evil, who could be appe only with fear and horror, and propitiated only human sacrifices. Mission work commenced in t during the latter part of the 9th century; th extended to Moravia, where two Greek missionaries and Methodius provided for the people a Slavoni

Slavonic Liturgy; thence to Bohemia, and so
s to the Scythian wilds and level steppes, where
he Russian kingdom of Rurik the Northman, and
about the close of the 10th century the Eastern
"silently and almost unconsciously bore into the
mightiest offspring."[1] But, though the baptism
ingir and the flinging of the triple and many headed
to the waters of the Dnieper was a heavy blow to
c idolatry, mission work was carried on with but
success; and it taxed all the energies of Albrecht,
of Bremen, of Vicilin, bishop of Oldenburg, of
Otto of Bamberg the apostle of the Pomeranians,
bert the martyr apostle of Prussia, to spread the
that country, in Lithuania, and in the territory of
nds. It was not till 1168 that the gigantic four
image of Swantevit was destroyed at Arcona,
tal of the island of Rügen, and this Mona of
superstition was included in the advancing
Christian civilization. As late as 1230 human
s were still being offered up in Prussia and
nia, and, in spite of all the efforts of the Teutonic
s to expel by force the last remains of heathenism
e face of Europe, idolatrous practices still lingered
t the people, while in the districts inhabited
Lapps, though successful missions had been
rated as early as 1335, Christianity cannot be said
e become the dominant religion till at least two
es later.

Moslem Missions.—The mention of the order of the
ic Knights reminds us how the crusading spirit had
d Christendom, and exchanged the patience of a
e or an Anskar for the fiery zeal of the warrior of
ss. Still it is refreshing to notice how even now
was found the famous Raymond Lully to protest
propagandism by the sword, to urge on pope after
e necessity of missions amongst the Moslems, and
his testimony with his blood outside the gates
giah in northern Africa (June 30, 1315). Out
crusades, however, arose other efforts to bear the
of the cross into the lands of the East, and to
the work which Nestorian missionaries from
d, Edessa, and Nisibis had already inaugurated
the Malabar coast, in the island of Ceylon, and
neighbourhood of the Caspian Sea. In 1245
oman pontiff sent two embassies, one to charge
ngol warriors to desist from their desolating inroads
urope, the other to attempt to win them over to
ristian faith. The first, a party of four Dominicans,
the commander-in-chief of the Mongol forces in
the second, consisting of Franciscans, made their
to Tartary, and sought to convert the successor
ai-Khan. Their exertions were seconded in 1253
labours of another Franciscan whom Louis IX. of
sent forth from Cyprus,[2] while in 1274 the
ted traveller Marco Polo, accompanied by two
Dominicans, visited the court of Kublai-Khan,
the commencement of the 14th century two
scans penetrated as far as Peking, and kept alive a
ng spark of Christianity in the Tartar kingdom,
anslating the New Testament and the Psalter into
artar language, and training youths for a native
y.[3]

Missions to India and the New World.—These ten
missions in the East were now to be supplemented by
on a larger scale. In 1486 the Cape of Good Hope
unded by Dias, and in 1508 the foundations of the
Portuguese Indian empire were laid by Albuqu
Columbus also in 1492 had landed on San Salvad
the voyages of the Venetian Cabot along the coast of
America opened up a new world to missionary ente
These bold discoverers had secured the countenance
pope on the condition that wherever they might p
flag they should be also zealous in promoting the ext
of the Christian faith. Thus a grand opportunit
given to the churches of Portugal and Spain. B
zeal of the Portuguese, even when not choked by the
lust of wealth and territorial power, took too o
one sided direction, repressing the Syrian Christia
the Malabar coast, and interfering with the Abys
Church,[4] while the fanatic temper of the Spe
maddened by his prolonged conflict with the infidel at
betrayed him into methods of propagating his faith
we cannot contemplate without a shudder, consigni
Mexico and Peru, multitudes who would not re
their heathen errors to indiscriminate massacre or
slavery.[5] Their only defender for many years w
famous Las Casas, who, having sojourned amongst
till 1516, has drawn a terrible picture of the oppr
he strove in vain to prevent.[6] Some steps indeed
taken for disseminating Christian principles, and th
in granting territory to the crowns of Spain and Po
had specially urged this duty, and had been instru
in inducing a band of missionaries, chiefly of the men
orders, to go forth to this new mission field.[7] B
results were scanty. Only five bishopries had
established by 1520, and the number of genuin
verts was small. In settling, however, his real
conqueror of Mexico evinced no little solicitude
spiritual welfare of his charge; and the labours
devoted men whom he begged the emperor to se
were successful in banishing every vestige of the
worship from the Spanish settlements.[8]

(*g*) *The Jesuit Missions.* It was during the pe
which we have now arrived that the great organiza
the Jesuits came into existence, and one of th
of Loyola's associates, Francis Xavier, was also one
greatest and most zealous missionaries of his or any
era. Encouraged by the joint co-operation of the
and of John III. of Portugal, and strongly tinge
Loyola with ideas of chivalry and self-devotion, he
barked at Goa on the 6th of May 1542, and bef
death on the Isle of St John (Hiang-Shang), Decem
1552, he had roused the European Christians of Go
new life, laboured with singular success amongst the
vars, a fisher caste near Cape Comorin, gathered
converts in the kingdom of Travancore, visited the
of Malacca, made his way to and founded a miss
Japan, thence revisited Goa, and impelled by the que
desire to unfurl the banner of the cross in China, h
out thither to fall a victim to malignant fever
early age of forty six, within sight of that vast empire
conversion had been the object of his holy ambition

The immediate successor of Xavier, Antonio Crim
was regarded by the Jesuits as the first martyr o
society (1562). Matthæo Ricci, an Italian by birt
also an indefatigable missionary in China for twenty
years, while the peculiar methods of unholy comp
with Brahmanism in India followed by Robert de'
drew down the condemnatory briefs of pope after pop
were fatal to the vitality of his own and other mi

representatives of the same order worked with
in evangelizing the Spanish settlement of Paraguay
82, while their defeated foes the Huguenots sent
nder a French knight of Malta a body of devoted
attempt the formation of a Christian colony at Rio
. By the close of the 16th century the unflag-
al of the Jesuits led to a more complete development
ganization of the missionary system of the Roman
. To give unity and solidity to the work of missions,
nittee of cardinals was appointed under the name
"Congregatio de propaganda fide," and to it was
ed the entire management of the mission, conducted
he superintendence of the pope. The scheme origin-
ith Gregory XIII., but was not fully organized till
ears afterwards, when Gregory XV. gave it plenary
ty by a bull dated June 2, 1622. Gregory's suc-
Urban VIII., supplemented the establishment of the
gation by founding in connexion with it a great
ary college, where Europeans might be trained for
labours, and natives might be educated to undertake
work wherever new colonies were settled. At
lege is the missionary printing press of the Roman
, and its library contains an unrivalled collection of
treasures bearing on the particular work. From its
ave gone forth numbers of devoted men, who have
themselves able to promote in a singular degree the
ment of the boundaries of the church by means of
al as well as spiritual forces.

3. *The Modern Period.*

last period of missionary activity is distinguished
ecial degree by the exertions of societies for the
ment of mission work.

ontrasted with the colossal display of power on the
the Church of Rome, it must be allowed that the
es which in the 16th century broke off from their
nce to the Latin centre at first presented a great
anxiety for the extension of the gospel and the
n of the heathen. The causes of this, however, are
to seek. The isolation of the Teutonic churches
e vast system with which they had been bound up,
flicts and troubles among themselves, the necessity
g their own principles and defining their own rights,
nated their attention upon themselves and their own
ork, to the neglect of work abroad.

the development of the maritime power of England,
he Portuguese and Spanish monarchies noted with
d jealousy, was distinguished by a singular anxiety
spread of the Christian faith. Edward VI. in his
tions to the navigators in Willoughby's fleet, Cabot
for the direction of the intended voyage to Cathay,
ld Hakluyt, who promoted many voyages of dis-
in addition to writing their history, agree with
mphrey Gilbert's chronicler that "the sowing of
anity must be the chief intent of such as shall make
empt at foreign discovery, or else whatever is builded
other foundation shall never obtain happy success
dinance." When on the last day of the year 1600
Elizabeth granted a charter to George, earl of
rland, and other "adventurers," to be a body-
nte by the name of "The Governor and Company of
ants of London trading with the East Indies," the
sed recognition of higher duties than those of com
may by some be deemed a mere matter of form,
use the words of Bacon, "what was first in God's
ence was but second in man's appetite and intention."
keen sense of missionary duty marks many of the
les of English mariners. Notably was this the case
he establishment of the first English colony in
ca, that of Virginia, by Sir Walter Raleigh. The
philosopher Heriot, one of his colleagues, laboured for
conversion of the natives, amongst whom the first bapt
is recorded to have taken place on August 13, 15
Raleigh himself presented as a parting gift to the Virgi
Company the sum of £100 "for the propagation of
Christian religion" in that settlement.[2] When Jame
granted letters patent for the occupation of Virginia
was directed that the "word and service of God
preached, planted, and used as well in the said colo
as also as much as might be among the savages borde
among them"; and the honoured names of Nicolas Fer
John Ferrar, Dr Donne, and Sir John Sandys, a pupil
Hooker, are all found on the council by which the h
management of the colony was conducted.

In the year 1618 was published *The True Honou
Navigation and Navigators*, by John Wood, D.D., dedica
to Sir Thomas Smith, governor to the East India Compa
and much about the same time appeared the well-kn
treatise of the famous Grotius, *De Veritate Religi
Christianæ*, written for the express use of settlers in dis
lands. The wants, moreover, of the North Ameri
colonies did not escape the attention of Archbishop L
during his official connexion with them as bishop
London, and he was developing a plan for promotin
local episcopate there when his troubles began and
scheme was interrupted. During the Protectorate,
1649, an ordinance was passed for "the promoting
propagating of the gospel of Jesus Christ in New Engla
by the erection of a corporation, to be called by the n
of the President and Society for the Propagation of
Gospel in New England, to receive and dispose of mon
for the purpose, and a general collection was ordered t
made in all the parishes of England and Wales;
Cromwell himself desired a scheme for setting up a cou
for the Protestant religion, which should rival the Ro
Propaganda, and consist of seven councillors and
secretaries for different provinces.[3] On the restoratio
the monarchy, through the influence of Richard Ba
with Lord Chancellor Hyde, the charter already gra
by Cromwell was renewed, and its powers were enlar
For now the corporation was styled "The Propagation
the Gospel in New England and the parts adjacent
America," and its object was defined to be "not only
seek the outward welfare and prosperity of those colo
but more especially to endeavour the good and salvatio
their immortal souls, and the publishing the most glori
gospel of Christ among them." On the list of
corporation the first name is the earl of Clarendon, w
the Hon. Robert Boyle was appointed president. Amo
the most eminent of its missionaries was the celebr
John Eliot, who, encouraged by Boyle, and assisted by
with considerable sums of money, brought out the Bibl
the Indian language in 1661–64, having revealed at the
of the Indian grammar which he had composed the secre
his success: "prayer and pains, through faith in Jesus Ch
will do anything." Boyle displayed in other ways his
for the cause of missions. He contributed to the
of printing and publishing at Oxford the four Gospels
the Acts of the Apostles in the Malay language, and at
death left £5400 for the propagation of the gospe
heathen lands.

The needs of the colonial church soon excited the at
of others also, and great efforts were made by
Beveridge, Archbishop Wake, Archbishop Sharpe,
Gibson, and afterwards by the philosophic Bishop T
and Bishop Butler, the famous author of the *Analogy*

[1] Hakluyt, *Voyages*, iii. 345.

his own Times*, i. p. 132.

p the colonial church and provide for the wants of the
tribes. In 1696 Dr Bray, at the request of the gover-
d assembly of Maryland, was selected by the bishop of
n as ecclesiastical commissary; and, having sold his
, and raised money on credit, he sailed for Maryland
9, where he promoted, in various ways, the interests
church. Returning to England in 1700–1, and
rted by all the weight of Archbishop Tenison and
Compton, he was graciously received by William III.,
received letters patent under the great seal of
nd for creating a corporation by the name of the
ety for the Propagation of the Gospel in Foreign
' on the 16th of June 1701.

h the establishment of this corporation the era of
tivity of societies for carrying out mission work may
d to commence, though the opening of the 18th
y saw other movements set on foot for the same
. Thus in 1705 Frederick IV. of Denmark founded
ion on the Coromandel coast, and inaugurated the
s of Ziegenbalg, Schultze, and Schwartz, whose
on and success told with such remarkable reflex
ce on the church at home. Again in 1731 the
ians illustrated in a signal degree the growing
ousness of obligation towards the heathen. Driven
rsecution from Moravia, hunted into mountain caves
rests, they had scarcely secured a place of refuge in
y before, "though a mere handful in numbers, yet
the spirit of men banded for daring and righteous
they formed the heroic design, and vowed the
ion of it before God, of bearing the gospel to the
and perishing tribes of Greenland and the West
, of whose condition report had brought a mournful
r to their ears." And so, literally with "neither
nor scrip," they went forth on their pilgrimage, and,
ible as it sounds, within ten years they had established
ns in the islands of the West Indies, in South
ca, Surinam, Greenland, among the North American
in Lapland, Tartary, Algiers, Guinea, the Cape of
Hope, and Ceylon.[1]

h were the preparations for the more general move-
during the last hundred years, and the manifesta-
missionary zeal on a scale to which it would be diffi-
find a parallel in Western Christianity.

progress that has been made may be best judged of
consideration of the following details:—

At the close of the last century there were only seven
ary societies in existence, properly so called. Of these
only, the Society for the Propagation of the Gospel in
Parts, the Halle-Danish Society, and the Moravians, had
work for the greater part of the century, whilst four, the
Missionary Society, the Baptist Missionary Society, the
Missionary Society, and the Dutch Society at Rotterdam,
their work only in its tenth decade. To-day these seven
in Europe and America alone, increased to upwards of
, and to these must be added, not only several independent
s in the colonies, but numerous missionary associations on a
scale, the offspring of English and American societies.

The following chronological lists illustrate the growth of
ary societies in Britain and the United States:—

Great Britain and Ireland.

rristian Faith Society for the West Indies.
ciety for Promoting Christian Knowledge.
ciety for the Propagation of the Gospel in Foreign Parts.
oravian (Episcopal) Missions of the United Brethren.
ptist Missionary Society.
ndon Missionary Society.
otrish Missionary Society.

Methodist New Connexion in England Foreign Missions.
1844. South American Missionary Society.
1849. Evangelical Continental Society.
1852. Indian Female Normal School Society.
1853. Lebanon Schools.
1855. Presbyterian Church in England Foreign Missions.
1856. Turkish Missions Aid Society.
1856. United Methodist Free Churches Foreign Missions.
1858. Christian Vernacular Education Society for India.
1860. Central African Mission of the English Universities.
1860. British Syrian Schools.
Melanesian Mission.
1865. Ladies' Association for Promoting Female Education among the
1866. China Inland Mission.
1867. Delhi Female Medical Mission.
1867. "Friends" Foreign Mission Association.
1868. Cape Town Aid Association.
1869. "Friends" Mission in Syria and Palestine.
Irish Presbyterian Missions.
1876. Spanish and Portuguese Church Aid Society.
Columban Mission.
Original Secession Church Indian Mission.
1877. Cambridge Mission to Delhi.
1880. Church of England Zenana Missionary Society.

United States of America.

1733. Corporation for the Propagation of the Gospel in New England.
1787. Society for Propagating the Gospel among the Indians at Boston.
1800. New York Missionary Society.
Connecticut Missionary Society for Indians.
1803. United States Mission to the Cherokees.
1806. Western Missionary Society for Indians.
1810. Board of Commissioners for Foreign Missions.
1814. Baptist Missionary Union.
1819. Methodist Episcopal Church Missionary Society.
1833. Free will Baptist Foreign Missionary Society in India.
1835. Foreign Missions of the Protestant Episcopal Church.
1837. Board of Foreign Missions of the Presbyterian Church.
1837. Evangelical Lutheran Foreign Missionary Society.
1842. Seventh Day Baptist Missionary Society.
Strict Baptist Missionary Society.
1843. Baptist Free Missionary Society.
1845. Methodist Episcopal Church, South.
1845. Southern Baptist Convention.
1846. American Missionary Association.
1857. Board of Foreign Missions of (Dutch) Reformed Church.
1859. Board of Foreign Missions of United Presbyterian Church.
American United Brethren, Moravian.
United States German Evangelical Missionary Society.
American Mexican Association.
Indian Home Missionary Association.
Indian Missionary Association.
Local Baptist Missionary Society.
Women's Union Zenana Missionary Society.

(*c*) At the beginning of the present century the total s
tributed for Protestant missions can hardly be said
amounted to £50,000; in 1882 the amount raised by Brit
tributions alone to foreign missions amounted to upw
£1,090,000,[2] thus divided:—

Church of England Missions	£460,
Joint Societies of Churchmen and Nonconformists	153,
Nonconformist Societies, English and Welsh	313,
Scottish and Irish Societies	155,
Roman Catholic Societies	10,

(*d*) At the same date it is calculated that there were abo
heathen converts under instruction, not counting those b
to the Roman Catholic missions. At the present day the
from heathenism may be estimated certainly at no l
1,800,000, a single year (1878) showing an increase of about

(*e*) When the Society for the Propagation of the Go
founded in 1701, there were probably not twenty clergyme
Church of England in foreign parts. The spiritual con
the settler in America and elsewhere was terrible in the
and no effort was then made by the church to win over the
to Christ. But now the position which the church hold
British colonies and dependencies and many parts of hea
is recognized by all. In those regions where the society
and which before it commenced its work were spiritu
"waste places" of the earth, there are, including the A
Church (the first fruits of the society's efforts), 138 bisho
than 5000 clergy, and upwards of 2,000,000 members
communion.

The above tables sufficiently indicate how varied
missionary agencies now at work, covering the

vith a network of mission outposts, which within century have won nearly two millions of converts hristian faith.

continuity of missionary enthusiasm maintained the primitive, the mediæval, and the modern periods hurch's history, operating at every critical epoch, viving after periods of stagnation and depression, y significant fact. It is true that other religions en called missionary religions, and that one of them the first place in the religious census of mankind.[1] nis ionary activity of Buddhism is a thing of the d no characteristic rite distinguishing it has found its a second continent; while, as for Mohammedanism, acter of its teaching is too exact a reflexion of the e, place, and climate in which it arose to admit ecoming universal." These and other religions of East may still maintain their hold over millions, but be admitted that their prospect of endurance in sence of advancing Christianity is very small, and fficult to trace the slightest probability of their izing with the intellectual, social, and moral progress odern world. With all its deficiencies, the Christian has gained the "nations of the future," and whereas 3d century the proportion of Christians to the uman race was only that of one in a hundred and is has now been exchanged for one in five,[3] and it putable that the progress of the human race at this is entirely identified with the spread of the e of the nations of Christendom.

by side with this continuity of missionary zeal, able feature is the immense influence of individual and the subduing force of personal character. individuals penetrated with Christian zeal and self has centred not merely the life, but the very e, of primitive, mediæval, and modern missions. Ulfila was to the Gothic tribes what Columba disciples were to the early Celtic missions, what ine or Aidan was to the British Isles, what Boniis to the churches of Germany and Anskar to Denmark and Sweden, that, on the discovery of a rld of missionary enterprise, was Xavier to India, Egede to Greenland, Eliot to the Red Indians, to the church of Cawnpore, Marsden to the Maoris, nd Marshman to Burmah, Heber, Wilson, Milman, ff to India, Gray, Livingstone, Mackenzie, Steere, y to Africa, Broughton to Australia, Patteson to ia, Mountain and Feild to Newfoundland, Crowther Niger Territory, Brett to Guiana. At the most epochs such men have ever been raised up, and the fluence of their lives and self-denial has told upon rch at home, while apart from their influence the istory of important portions of the world's surface ave been altered.

om the agents themselves we turn to the work that en accomplished it will not be disputed that the of missions has been marked amongst rude and nal tribes. What was true in the early missions n found true in these latter times. The rude and us northern peoples seemed to fall like "full ripe efore the first breath of the gospel." The Goths Vandals who poured down upon the Roman empire angelized so silently and rapidly that only a fact nd there relating to their conversion has been ed. Now this is exactly analogous to modern nce in the South Seas, America, and Africa. st here content ourselves with a cursory survey of what missionary enterprise has accomplished in regions and among the more civilized nations of Ea Asia.

The South Seas.—That missions have done much in these re in suppressing cannibalism, human sacrifices, and infant humanizing the laws of war, and elevating the social condit women, is a fact confirmed by the researches of Meinicke, V Gerland, Oberlander, and even of Darwin.[4]

In Australia work among the aborigines, wherever it has zealously conducted, has been blessed with signal success. An the Papuans the Moravian stations of Ebenezer in the distr Wimmera, and Ramahyuck in that of Gippsland, can po then little villages of 125 native Christian inhabitants, cleanly houses, and their well-ordered churches. In the dist South Adelaide, at Point Macleay, the Scottish Presbyterian M has been similarly successful, while in New Zealand the population was converted almost within a single generation. islands north and north west of Australia the Dutch missio have been especially successful in the Minahassa (see CEL of whose 114,000 inhabitants more than 80,000 have been over to the Christian faith, forming 195 communities wit schools, and in southern Borneo, the Rhenish Mission in the and the Society for the Propagation of the Gospel in the north been enabled to establish themselves firmly, while the f society has also done a great work among the Battaks in Su Amongst the dark coloured races of Polynesia missionary wo made great advances through the labours of the London Miss Society, the Wesleyans, and the American Board. Making its basis of operations, the first-named society has carri missionary operations in the islands of Australasia, Hervey, S Tokelau, and Ellice, while the American Board has wit equally favourable results in the Sandwich Islands, and in Mier (Caroline, Marshall, and Gilbert Islands) the agents of the Ha Association are actively at work under the direction of Am missionaries. In Melanesia the Society for the Propagation Gospel, the Wesleyans, the London Missionary Society, a Presbyterians are all actively engaged. The Fiji group stan as one of the most promising centres of Christian civilizatio the governor, Sir A. Gordon, was enabled to report in 1879 that, a population of about 120,000, 102,000 are now regular worsh in the churches, which number 800, while over 42,000 childr in attendance on 1531 Christian day schools. The Loyalty I have been occupied partly by Roman Catholic missions and by the London Missionary Society, while in the New Hebrid missionaries of the Free Church of Scotland and of the P terian churches of Canada, New Zealand, and Australia, i of many obstacles, the unhealthiness of the climate, and the v of the dialects spoken, have upwards of 3000 natives re Christian teach . 800 communicants, and 100 native te On the islands Banks, Santa Cruz, and Solomon, the E Episcopal Church is achieving no little success, sending native for months at a time to Norfolk Island to receive instruction, v they return again in order to spread the knowledge of truth at These islands will ever be famous in connexion with the death of the noble Bishop Patteson.

The Uncivilized Peoples of America.—The quiet humble l of the Moravians have accomplished much in Greenlan Labrador, whilst among the Indians of Canada and the pe Hudson's Bay the Society for the Propagation of the Gosp not laboured in vain, nor the Church Missionary Society dioceses of Rupertsland, Red River, Saskatchewan, and Mac At Columbia, on the coast of the Pacific, a practical missionary named William Duncan has succeeded in civilizing a body of I degraded by cannibalism, and at his Metlakahtla mission at the head of a community of some thousand persons, which larger church than is to be found between there and San Fra Testimony to the value of the results achieved was borne in by Lord Dufferin, then governor-general of Canada, who de that he could hardly find words to express his astonishment a he witnessed. Amongst the Indian tribes of the United work is carried on by the Moravians, the American Board of Mi the Presbyterians of the North and South, the Baptists, the copal Methodists, and the American Missionary Society; an result is that 27,000 Indians, divided amongst the 171 commu of different denominations (including the Roman Catholic) are membership with the church, and have 219 places of wo besides 366 schools attended by about 12,222 Indian children Cherokees, the Choctaws, the Creeks, the Chickasaws, have own churches, schools, and academies, and may compare favo both intellectually and morally with their white neighbo Missouri, Arkansas, and Texas.[5] Amongst the negroes in the States more than 1000 places of worship have been built sin last war, while the American Missionary Association alo erected 26 academies with about 6000 students, for the purp

ring freed slaves to be teachers and missionaries. Amongst
ndians on the Essequibo and Berbice in British Guiana, the
ns of the Society for the Propagation of the Gospel have been
y extended, and now upwards of half the Indian population
embers of Christian churches. In the British West Indies,
gh the united labours of various missionary societies, out of
000 inhabitants upwards of 248,000 are returned as regular
ers of the churches, 85,000 as communicants, while 78,600
n receive instruction in 1123 day schools, of which number
45,000 belong to Jamaica.

sing to the southern promontory of South America, we find
he self-denying labours of Allen Gardiner are beginning to
the devotion that prompted them. The London South
can Missionary Society not only carries on its operations in
alkland Islands, where youths from Tierra del Fuego receive
ction, but has founded stations in Tierra del Fuego itself, has
the natives of Patagonia from their spiritual deadness, and
tended its labours even to the Indians in Brazil

ica.—Here there are three great regions of missionary activity,
he west coast, in the south, and in some parts of the east
largest and most fruitful mission field in West Africa is
f Sierra Leone, where at least seven eighths of the people
w Christians, though the first mission does not date further
han the present century,[1] and important results have also
btained in Senegambia (on the Ponga-), in Old Calabar, and
republic of Liberia. On the Gold and Slave Coasts the
s of English Wesleyan missionaries and of the North German
nary societies have been crowned with no small success, while
sel Society, which celebrated its jubilee in 1878, has extended
here of activity to Ashantee, translating the Scriptures into
tive languages, and changing primeval marshes into bright-
g Christian villages. In the Yoruba lands the Church
nary Society has 11 stations, 5994 Christians, and 1657
rs, while on the Niger we are confronted with the interesting
cle of negro preachers and teachers labouring under the
ed Bishop Crowther, carrying on a work which within the
w years was consecrated by the blood of martyrs
th Africa has for some time been a centre of missionary
y. Here thirteen British and Continental associations have
that all the South African races, Hottentots and Kaffirs,
s and Bechuanas, Basutos and Zulus, are capable of attaining
nderable degree of Christian civilization, and can not be
ted in handicraft and agriculture, but trained as ministers
achers. A single instance of this is afforded in British
ria by the Lovedale Institute of the Free Church of Scotland,
youths from all the above-mentioned tribes are taught along
Europeans, and every Sunday sixty students proclaim the
in the neighbouring villages. In the cause of mission work
ew ever laboured more zealously than the late Bishop Gray,
diocese, when first constituted, included the whole colony
Cape, but whose successor has now for his suffragans the
s of Grahamstown, Maritzburg, St Helena, Bloemfontein,
nd, St John's, and Pretoria.

and East Central Africa, so long neglected, is now being
y occupied by missionary enterprise. Here the island of
gascar has been in great part evangelized, while on the island
auritius the Anglican Mission has developed pre-eminent

Steere has not only erected a cathedral on the site of the
slave-market, but translated the New Testament into
ili, a language which can be understood by the tribes around
ces, and even in Uganda.

a.—"O mighty fortress! when shall these impenetrable
gates of thine be broken through?" was the mournful
nation of Valignani, the successor of Xavier, as he gazed in
s at the mountains of China. The words well express the
ible difficulties which this largest and most thickly peopled
n land in the world, with its petrified constitution and
of three thousand years, presents in the way of missionary
The country itself, the people, their speech, their manners,
religion, their policy, seemed to unite in opposing an insuper
arrier, but history has to record how efforts have been made
ny bodies, and at many times, to break it down. An early
ian Church established itself in the empire, but was either
ed, or died out in course of time. In the 16th century the
s undertook the task, and in spite of the persecutions which
ave undergone the missions of the Roman Church, with their
ous foreign clergy and their hosts of natives of different
astical degrees, have attained no small measure of success.
the country was really opened to foreigners by the treaty
ntsin, pioneers proceeded thither from America, and from
London Missionary Society. The labours of Dr Legge
nslating and reducing to system the Chinese classics are

[1] See Lightfoot, *Ancient and Modern Missions*, p. 10.

well known. At the present day it is estimated that t
upwards of 29 societies at work in the country, with al
ordained missionaries and 63 female teachers, and the n
constantly increasing. These societies, of which the larg
portion belong to England, and the next largest to America,
it is estimated, 20 theological schools, 30 higher boarding
for boys with 611 scholars, 38 for girls with 777 scholars,
schools for boys with 4000 to 5000 pupils in attendance, 82
with 1307, while 16 missionary hospitals and 24 dispens
under the direction of medical missionaries, whose work in C
been recognized almost from the first as the source of the
blessing. The mission centres stud the east coast from Ho
and Canton to the frontiers of Manchuria in the north
they advance little by little every year into the interior,
yet the western provinces are scarcely touched by missiona
The literary labours of the various societies have been c
with the utmost perseverance, and on the foundations l
Morrison and a Milne later toilers have been enabled to
superstructure of translations of various portions of the
well as various Christian books and religious and general pe
which constitute a mean of vast importance towards g
gaining over this land of culture. At Peking a Russian

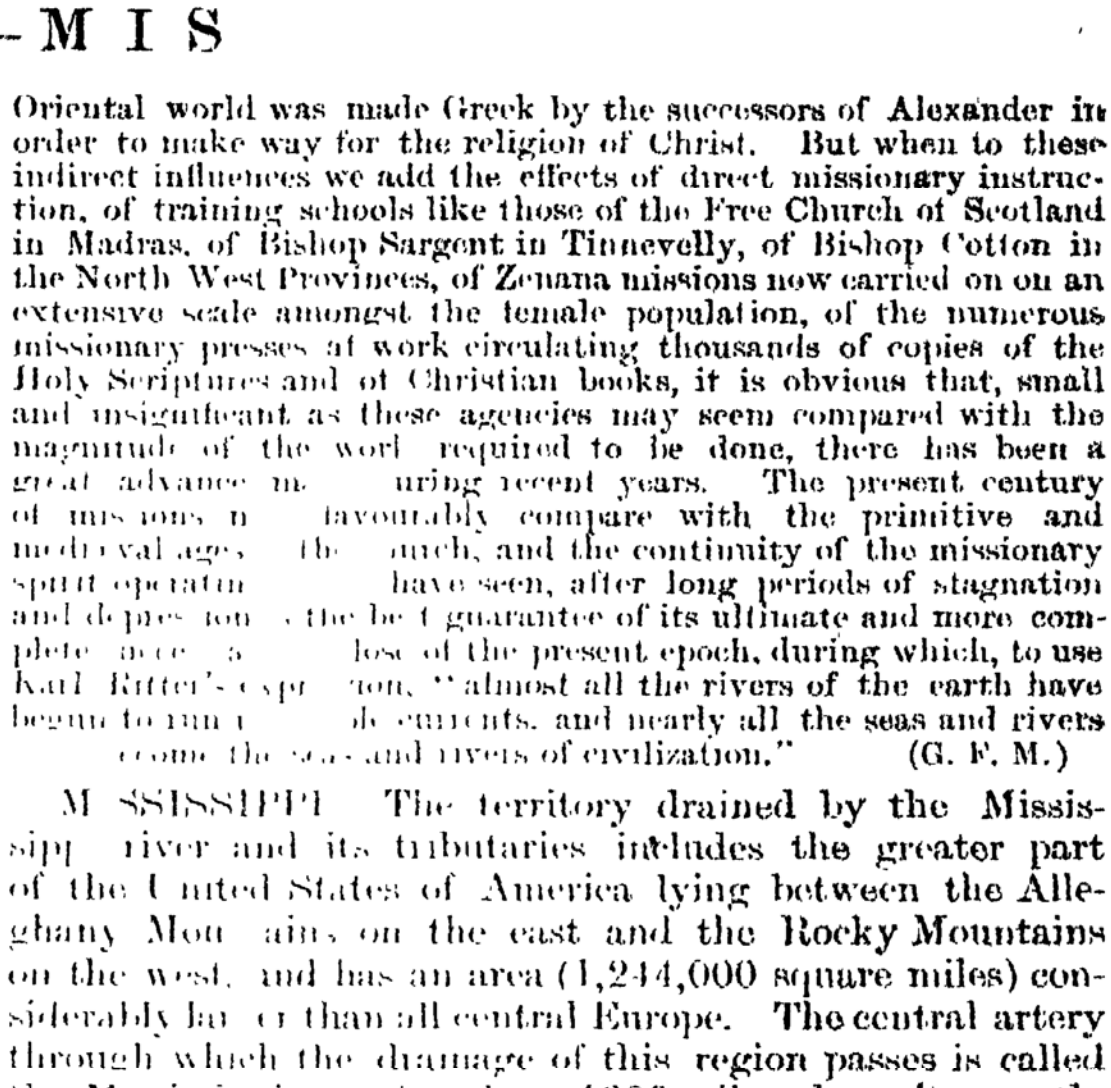
rapid. In Cuddapah, *e.g.*, in the Telugu territory, the
or the Propagation of the Gospel and the London Mission-
ty laboured side by side for upwards of thirty years without
over more than 200 converts. Then on a sudden there
p a revival among the non-caste population, and the 200
early 11,000. Among the Kols, after five years' waiting,
e missionaries baptized their first converts in 1850; now
mean and English stations together these amount to about
since the famine, however, in 1878-79, the increase of new
has been still more rapid, and the practical experience of
nority of Christian pay to heathen self-lness and of the
ss of their heathen doctr ntrasted with the effect produced
ent missionary labour in past years brought thou-ands
old of the church. Tru in the Tinnevelly district, where
h Missionary Society carries on its operations, upwards of
athens applied in 1878 to Bishop Sargent and his native
instruction preparatory to baptism. In the same district
xion with the Society for the Propagation of the Gospel,
July 1877 and the end of June 1878 upwards of 23,561
took themselves to Bishop Caldwell and his fellow-
for Christian teaching. Thus the English Church mi-
Tinnevelly and Ramnad received in little more than a year
an increase of 35,000 souls, and the Propagation Society
proclaiming the gospel in nearly six hundred and fifty
the Tinnevelly district, amongst not merely food seeking
rstians" but those who have had the courage to face severe
on for joining the Christian church. Encouraging progress
een made among the Santals and the Karens in Burmah

Speaking generally, it may be said that the largest
s of native converts are in the south, in the presidency of
next to southern India the most fruitful field is Burmah,
American Baptist missionaries are carrying on a success-ful
ng the Karens, while the Propagation Society has founded
ools on the Irrawadi, and penetrated up to Rangoon, and
ritish territory to Mandalay, next in point of number stand
of the North West Province. Here the largest contingent
d by the missionaries in Chutia Nagpúr, among the aboriginal
the Kols, while the Santal mission also presents many
g features. For the Punjab district and that of Sind,
h Missionary Society has printed in Lahore a flourishing
l seminary for Christian literature. Sikhs, and Mohammed
Christianity has advanced thereby way of Peshawur
anistan and Kohat. It thus appears that by far the
greatest success has been obtained amongst the aboriginal
those who are either of low caste or of no caste at all,
real strongholds of the Hindu religion and civilization
four life-strong fortresses and defy the attempts of the
Still the disintegrating agencies of contact with Chris-
working out their slow but sure results. "Statistical facts,"
Battle Frere, "can in no way convey any adequate idea
al done in many part of India. The effects often enormous
to be met by a single avowed conversion. The teaching
anity among st 160 millions of cavilling Hindus
immediate in India to effect three changes, moral, social, and
which for extent and rapidity are effected far more extra-
than any that have been witnessed in modern Europe."
mber of actual converts to Christianity in India," says
ence, "does not by any means give an adequate result
nary labours. There are thousands of persons scattered
e wide from the knowledge they have acquired either
ol indirectly through dissemination of Christian truth
stian principles have lost all belief in Hindu ism and
dation, and are in their conduct influenced by motives
who yet fear to make an open profession of the change
t they should be looked upon as outcasts and lepers
own people." To some such a negative result may at
appear discouraging, but read by the light of history,
critical, almost necessary, stage of transition from
to a purer religion to Christianity. The Brahmo Somaj
ce in Bengal where a system too vague and shadowy
to contain in the element of a permanent religion has
proved a bridge between the abandonment of the old and the
of the new faith. The cultured classes amongst the
and Romans experienced in their day, after the popular
y had ceased to satisfy, a period of utter scepticism before
ity had recovered hold. Meantime in India the indirect
which are at work—the results of war and conquest of
science and European literature, of the telegraph and
s, the book and the newspaper, the college and the school,
e of law hallowed by immemorial usage the disregard of
ained prejudices, the very presence of Europeans in all
the country—all these various influences are gradually
about results analogous to that to which Sir James Mack-
ferred in a conversation with Henry Martyn, when the

ct of Church Missionary Society's Report for 1879, p. 13.
t of the Propagation Society for 1879, p. 31 *sq.*

Oriental world was made Greek by the successors of Alexander in order to make way for the religion of Christ. But when to these indirect influences we add the effects of direct missionary instruction, of training schools like those of the Free Church of Scotland in Madras, of Bishop Sargent in Tinnevelly, of Bishop Cotton in the North West Provinces, of Zenana missions now carried on on an extensive scale amongst the female population, of the numerous missionary presses at work circulating thousands of copies of the Holy Scriptures and of Christian books, it is obvious that, small and insignificant as these agencies may seem compared with the magnitude of the work required to be done, there has been a great advance m uring recent years. The present century of missions favourably compare with the primitive and mediæval ages hurch, and the continuity of the missionary spirit operatin have seen, after long periods of stagnation and depression, the best guarantee of its ultimate and more complete success. lose of the present epoch, during which, to use Karl Ritter's expr ion, "almost all the rivers of the earth have begun to run d currents, and nearly all the seas and rivers become the seas and rivers of civilization." (G. F. M.)

MISSISSIPPI. The territory drained by the Mississippi river and its tributaries includes the greater part of the United States of America lying between the Alleghany Mountains on the east and the Rocky Mountains on the west, and has an area (1,244,000 square miles) considerably larger than all central Europe. The central artery through which the drainage of this region passes is called the Mississippi river for about 1300 miles above its mouth. The name is then usurped by a tributary, while the main



The Mississippi and its Tributaries.

stream becomes known as the Missouri. From its remote sources in the Rocky Mountains to the Gulf of Mexico the total length of the river is about 4200 miles. The other principal tributaries are the Ohio, the Arkansas, and the Red River, but the Yazoo and the St Francis often make dangerous contributions in seasons of flood.

The tables given below exhibit the hydraulic features of the Mississippi and its principal tributaries.

Below the influx of the Ohio the Mississippi traverses alluvial bottom lands liable to overflow in flood seasons. The soil is of inexhaustible fertility, producing large crops of corn in the northern portion, cotton in the middle district, and sugar, rice, and orange groves near the mouth. These bottom lands, averaging about 40 miles in width, extend from north to south for a distance of 500 miles, having a general southern slope of 8 inches to the mile. The river winds through them in a devious course for 1100 miles, occasionally on the east side washing bluffs from 100 to 300 feet in height, but usually confined by banks of its own creation, which, as with all sediment-bearing rivers of like character, are highest near the stream itself. The general lateral slope towards the foot hills is about 6 inches

00 feet, but the normal fall in the first mile is about . Thus apparently following a low ridge through the n lands, the tawny sea sweeps onward with great ty, eroding its banks in the bends and rebuilding on the points, now forming islands by its deposits, now removing them as the direction of the flow is ied by the never-ending changes in progress. Chief g such changes is the formation of cut-offs. Two ng bends gradually approach each other until the water a passage across the narrow neck. As the channel nce between these bends may be many miles, a cascade ps 5 or 6 feet in height is formed, and the torrent s through with a roar audible for miles. The bank ve like sugar. In a single day the course of the river nged, and steamboats pass where a few hours before lough had been at work. The checking of the current upper and lower mouths of the abandoned channel obstructs them by deposit, and forms in a few years f the characteristic crescent lakes which are so marked ure on the maps.

The total area of the bottom lands is about square miles, of which only a narrow strip alo immediate banks of the main river and of its p bayous and tributaries has even yet been brough cultivation. A proper system of protection against would throw open 2,500,000 acres of rich sug 7,000,000 acres of the best cotton land in the wo 1,000,000 acres of corn land of unsurpassed fertilit

The work of embankment began in 1717, wh engineer De la Tour erected a dyke or levee 1 mile protect the infant city of New Orleans from o Progress at first was slow. In 1770 the sett xtended only 30 miles above and 20 miles belo Orleans; but by 1828 the levees, although quite insi in dimensions, had become continuous nearly to the of Red River. In 1850 a great impulse was g systematic embankment by the U.S. Government gave over to the several States all unsold swamp an flowed land within their limits to provide a fund claiming the district liable to inundation. ng from this caused alarm in Louisiana, for the great
lands above were believed to act as reservoirs to
the highest flood wave; and it was imagined that
were closed by levees the lower country would
rwhelmed whenever the river in flood rose above
nal banks. The aid of the Government was in
and Congress immediately ordered the necessary
gations and surveys. This work was placed in
of Captain (now General) Humphreys, and an
e report covering the results of ten years of investi-
was published just after the outbreak of the civil
1861. The second of the tables given above, and
most of the physical facts respecting the river are
from this standard authority.

nderstand the figures of the tables it should be noted
the mouth of Red River, 316 miles above the passes,
er surface at the lowest stage is only $5\frac{1}{10}$ feet above
l of the Gulf, where the mean tidal oscillation is
$\frac{6}{10}$ feet. The river channel in this section is there
freshwater lake, nearly without islands, 2600 feet
d 100 feet deep along the deepest line. At the
ge the surface rises 50 feet at the mouth of Red
ut of course retains its level at the Gulf, thus giving
d necessary to force forward the increased volume
harge. Above the mouth of Red River the case
tially different. The width increases and the depth
es, islands become numerous, the oscillation be-
high and low water varies but little from 50 feet
he mouth of the Ohio is reached a distance of
00 miles. Hence the general slope in long distances
nearly the same at all stages, and the discharge
ated by the varying resistances of cross section, and
changes in slope due to the passage of flood waves
nted by the different tributaries. The effect of
ifferent physical condition appears in the compara
lumes which pass through the channel. At New
the maximum discharge hardly reaches 1,200,000
eet per second, and a rising river at high stages
only about 100,000 cubic feet per second more than
alling at the same absolute level; while just below
uth of the Ohio the maximum flood volume reaches
00 cubic feet per second and at some stages a
iver may carry one third more water than when
at the same absolute level.

percentage of sedimentary matter carried in suspen
the water varies greatly at different times, but is
y not dependent upon the stage above low water
rgely determined by the tributary whence the water
, but is also influenced by the caving of the banks,
always excessive when the river is rapidly falling
he spring flood. In long periods the sedimentary
is to the water by weight nearly as 1 to 1500, and
as 1 to 2900. The amount held in suspension
nually contributed to the Gulf constitutes a prism
square and 263 feet high. In addition to this
a large volume, estimated at 1 mile square and
high annually, is pushed by the current along the
and then transported to the Gulf.

me the general succession of stages for long periods
uniform, but so many exceptions are noted that
ate predictions can safely be made for any particular
The river is usually lowest in October. It rises
until checked by the freezing of the northern
ries. It begins to rise again in February, and attains
est point about the 1st of April. After falling a few
gain rises until, early in June, it attains nearly the
vel as before. After this it rapidly recedes to low-
mark. As a rule the river is above mid stage from
y to August inclusive, and below that level for the
ler of the year.

It has been established by measurement and obse
that the great bottom lands above Red River before t
struction of their levees did not serve as reserv
diminish the maximum wave which passed t
Louisiana in great flood seasons. They had already
filled by local rains and by water escaping into the
the Mississippi through numerous bayous, so that
date of highest water the discharge into the river ne
southern borders was fully equal to the volume wh
wave had lost in passing along their fronts.

In fine, the investigations between 1850 and 1860
lished that no diversion of tributaries was possible;
reservoirs artificially constructed could keep back the
freshets which caused the floods; that the making
offs, which had sometimes been advocated as a meas
relief, so far from being beneficial, was in the highest
injurious; that, while outlets within proper limit
theoretically advantageous, they were impracticabl
the lack of suitable sites; and, finally, that levees p
constructed and judiciously placed would afford pro
to the entire alluvial region.

During the civil war (1861-65) the artificial embar
were neglected, but large sums were expended
States directly interested in repairing them. The work w
without concert upon defective plans, and a great flood
1871 inundated the country, causing terrible suffering a
Congress, then in session, passed an Act creating a comm
five engineers to determine and report on the best system
permanent reclamation of the entire alluvial region. Their
rendered in 1875, endorsed the conclusions of that of 18
advocated a general levee system on each bank. This
comprised 1st a main embankment raised to specified
sufficient to restrain the floods; and 2d, where reasonable
against caving required considerable areas near the rive
thrown out, exterior levees of such a height as to exclude
high water, but to allow free passage to great floods, wh
rule only occur at intervals of five or six years. The back
would thus be securely protected, and a safe refuge would
vided for the inhabitants and domestic animals living u
portion subject to occasional overflow. An engineering o
tion was proposed for constructing and maintaining these
and a detailed topographical survey was recommended to de
their precise location. Congress promptly approved and
the survey, but strong opposition on constitutional grou
raised to the construction of the levees by the Government.

In the meantime complaints began to be heard respec
low water navigation of the river below the mouth of th

of five army engineers, appointed in 1878 to consider
relief, reported that 10 feet could probably be secured by
ing the wide places to about 3500 feet with hurdle work
ropes, or brush dykes designed to cause a deposit of
and by protecting caving banks, when necessary, by such
cheap mattresses as experience should show to be best suite
work. Experiments in these methods were soon begun u
river above Cairo and have since proved of decided benefit.

In June 1879 Congress created a commission of seven
to mature plans to correct, permanently determine, and dee
channel, to protect the banks of the river, to improve a
safety to navigation, to prevent destructive floods, and to
and facilitate commerce. Up to 1882 appropriations am
to $1,785,000 were made to execute the plans of this com
but with provisos that none of the funds were to be e
in repairing or building levees for the protection of land
overflow, although such levees might be constructed if n
to deepen the channel and improve navigation. Acting un
its duties the commission have allotted considerable sums
closing breaks in the levees; but their chief dependence
contracting the channel at low water by promoting lateral
to rely upon protecting the high water banks against caving by
brush, wire, &c., ballasted where necessary with stone,
tially the plans proposed by the army board of 1878.

depth does not exceed 12 or 13 feet. The first appropriation by Congress to secure increased depth was made in 1837, and was expended in an elaborate survey and in a system of dredging by buckets, but the plan of a ship canal was also discussed. At the next appropriation, made in 1852, a board of officers, appointed by the war department, recommended trying in succession (1) stirring up the bottom by suitable machinery, (2) dredging by buckets, (3) constructing parallel jetties 5 miles long at the south west pass, to be extended as found necessary, (4) closing lateral outlets, and (5) constructing a ship canal. A depth of 18 feet was secured by the first plan, and was maintained until the available funds were exhausted. Under the next appropriation (1856) an abortive attempt was made to apply the plan of jetties to the south west pass. This failed from defects in execution by the contractors, but a depth of 18 feet was finally secured by dredging and scraping. The report of 1861 discussed the subject of deformation at length. Although it approved the plan of jetties and closure of outlets as correct in theory, the stirring up of the bottom by scrapers during the flood stages of the river six months annually was recommended by it as the most economical and practicable. After the war this recommendation was carried into effect for several years with improved machinery, giving a maximum annual cost a depth at times reaching 20 feet at extreme low water, but experience indicated that not much more than 18 feet could be steadily maintained. This depth, entirely satisfactory in 1873, soon became insufficient to meet the growing demands of commerce, and in 1873 Major Howell, the engineer in charge, revived the project of a ship canal. The subject was discussed before a board of army engineers, the majority approving a jetty plan. In 1874 Congress constituted a special board which, after visiting Europe and examining similar works of improvement there, reported in favour of constructing jetties at the south pass, substantially upon the plan used by M. Caland at the mouth of the Meuse; and in March 1875 Captain J. B. Eads and associates were authorized by Congress to open by contract a broad and deep channel through the south pass upon the general plan proposed by the board. The contract called for "the maintenance of a channel of 30 feet in depth and 350 feet in width for twenty years" by "the construction of thoroughly substantial and permanent works by which said channel may be maintained for all time after their completion." The jetties were to be not less than 700 feet apart. The sum of $5,000,000 was to be paid for obtaining the channel, and $4,000,000 for maintaining it for twenty years. In addition the contractors were authorized to use any material on the public lands suitable for mattress in the work. The south pass was 12½ miles long. It had an average width of 730 feet and a minimum interior channel depth of [illegible]. The distance from the 30 foot curve inside the jetties to the 30 foot curve outside was 11,900 feet. The minimum depth at average flood tide on the bar was about 8 feet. The discharge at the mouth was about 57,000 cubic feet of water per second, transporting annually about 22 million cubic yards of sediment in suspension to the Gulf. A small island and shoal existed at the head of the pass, the channel there having a minimum depth of 17 feet. The work was begun on June 2, 1875, and has been so far successful that during the year ending June 30, 1882, a channel was maintained having a least depth of 30 feet between the jetties and extending through the bar. Its least width was 20 feet, the average being 105 feet. The 26-foot channel had a least width of 200 feet, except for a few days. In the pass itself the 26 foot channel had a least width of 50 feet. A very powerful dredge boat was at work between and beyond the jetties 87 days, of which 51 were devoted to the channel in the Gulf. A deepening of 6 feet has occurred in Pass à l'Outre near its head since 1875. Up to the present time the work has proved of great benefit to the commerce of New Orleans.

For further details, see RIVER ENGINEERING. (H. L. A.)

MISSISSIPPI, one of the Southern States of the American Union, derives its name from the river which for more than 500 miles forms its western boundary between the 35th and 31st parallels of north latitude, separating it from Arkansas and Louisiana. The boundary with the latter State is continued along the 31st parallel, for 110 miles, to the Pearl river, and then down the Pearl to its mouth. The Gulf of Mexico, eastward from the mouth of Pearl river, completes the southern boundary. On the north the 35th parallel, from the Mississippi river to the Tennessee, separates the State from Tennessee, and the boundary then follows the latter river to the mouth of Bear Creek, in 34° 53′ N. lat. and 88° 15′ W. long. The eastern boundary of the State, separating it from Alabama, follows a line drawn from the mouth of Bear Creek about seven degrees west of south to what was "the north western corner of Washington county on the Tombigbee," and thence due south to the Gulf of [illegible]. Ship, Horn, Cat, and Petit Bois Islands, and those on the shore, form a part of Mississippi. The extreme length of the State, north and south, is 330 miles, and its maximum breadth is 188 miles. Under the United States surveys, begun in 1803, the State has been divided into townships and sections, except such parts as were at first owned by individuals. The area of the State is given in the census reports for 1880 at 46,340 square miles.

Topography. There are no mountains in Mississippi, but a considerable difference of level exists between the almost continuously low, flat, alluvial region lying along and between the Mississippi and Yazoo rivers, called "the Bottom," and nearly all the remainder of the State, which is classed as upland. The latter part, comprising two-thirds of the whole, is an undulating plateau whose general elevation above the water of the Gulf of Mexico is from 100 to 150 feet within a few miles of the coast, and thence elsewhere from 150 to 500 or 600 feet. Some exceptional points are probably 800 feet high. The streams in this region flow in valleys varying in width from a few yards to several miles, and [illegible] bluff of each river is usually a considerable part of the valley of each larger stream, several feet above its high water mark, and forms the "hammock," or "Bottom" land. On some of the rivers the lowest part of the valley, subject to overflow, is several miles wide, and bears a resemblance to the Mississippi Bottom. Ridges or plateaux everywhere in the upland divide the contiguous basins of creeks and rivers, descending more or less abruptly to their valleys. In the northern part of the State, almost level prairies cover large areas, overlying a Cretaceous formation called Rotten Limestone.

A line of abrupt bluffs, extending southward from the north west corner of the State, divides the upland region from the Bottom, where the general surface lies below the high water level of the Mississippi river. A few ridges, running north and south, and embracing 200,000 acres, are barely above high water. The elevated lands in the Bottom lie on these, and on the banks of the rivers and the numerous lakes and bayous, which are slightly elevated. Low swamps or marshes, in which flourish large cypress trees (*Taxodium distichum*), lie between the streams, and frequently receive the surface drainage from their banks. Large forest trees and dense cane brakes (*Arundinaria gigantea*) occupy the ground. The Mississippi river is prevented from flooding the Bottom during high water by a system of levees or embankments built by a fund derived partly from a tax on the land and partly from the proceeds of the sale of public lands in the State classed as "swamp lands," which were given over for the purpose by Congress. The original compensation for the injury done when breaks in the levees occur is the deposit of alluvial matter on the overflow, which adds to the productiveness already wonderfully fertile soil. The present levee system usually protects about one fourth of the 4,000,000 acres in the Bottom. Many crescent-shaped lakes (*Oxbows*) occur on the Bottom. Similar phenomena present themselves in the channels of the other river bottoms.

The volume of water in the streams varies greatly in the year, and is usually largest between the months of January and April. During high water all the principal streams are navigable by steamboat. These ply on the Mississippi, Tennessee, and Yazoo rivers throughout the whole year. The rivers flowing into the Gulf are obstructed by sand bars, and are chiefly used for floating logs to the saw-mills on the coast.

oest and only deep harbour on the coast is the well-
d roadstead inside of Ship Island. It has a depth
eet, a firm clay bottom, and is readily accessible to
from the shallower harbours along the coast.

e. Near the waters of the Gulf of Mexico the climate is
ilder than in the northern parts of the State. On the
border the temperature rarely falls to 32° Fahr., or exceeds
annual mean being about 68°. The orange, lemon,
banana and olive can be grown without protection. In
ne of Vicksburg the temperature ranges from 98° to 20°,
y lower, the annual mean is 65°. The range in the
part of the State is from 98° to 15°, or rarely 10°, and the
ean is 61°. The first and last hoar frosts occur, in the
arts of the State, usually in the latter part of October and
The ground is seldom frozen to the depth of 5 inches, and
a few days at a time. The rainfall on the coast is 60 to 65
r annum, and at the northern boundary 50 inches. While
o-thirds of the precipitation occurs in winter and spring,
seldom passes without several inches of rainfall
and sea breeze on the south, and variable winds elsewhere,
heat of summer tolerable. In healthfulness Mississippi
s favourably with other States. The average death rate of
States, variously situated as given in the census of 1880,
er cent.; that of Mississippi is 1·19 per cent. Where the

rals.—Metallic ores are not found in Mississippi in paying ies. The only valuable minerals are sandstone and lime marls, sands, lignite or brown coal, and fire clay. None o ave been extensively brought into market. Potable water almost everywhere. Artesian wells furnish it in the Rotten ne region, when bored into the underlying Cotton-stone.

a.—Mississippi affords perhaps no species which are not n the neighboring States. There are thirty or forty species *malia*, the most remarkable being the American opossum, hite abundant. The deer (*Cervus canadensis*), black bear *americanus*), wolves (*Canis lupus* and *Lupus occidentalis*), unt (*Felis concolor*), and wild-cat (*Lynx rufus*) have much ed in number, and may, like the buffalo and elk, shortly extinct. About one hundred and fifty species of birds nd during at least part of the year. Many are seen only *situ*, and about twenty species, from the north spend the here. The mocking bird (*Mimus polyglottus*), the most able songster, is very abundant. The wild turkey (*Meleagris o*) survives by virtue of its wary and watchful character. fty species of *Reptilia* have been found, prominent among is the alligator (*A. mississippiensis*), which attains a length r 15 feet, and is common in the southern river bottoms. ttlesnake, moccasin, and copperhead, venomous serpents, are ually found. About half of the sixty three species of fish ing in the fresh and salt waters of the State are valuable d. The edible oysters and crustaceans of the coast are ably fine.

z.—Originally nearly the entire State was covered with a of forest trees of large size, mostly deciduous. The under- was kept down by annual burnings by the natives, and ound became carpeted with grasses and herbs. Over 120 of forest trees are found; many valuable ones are abundant, eir timber constitutes a large item in the resources of the Of the 15 species of oak the most valuable are the live-oak *rens*), found near the coast, and the white oak (*Q. alba*), distributed. The cypress (*Taxodium distichum*) is very ant in the bottoms. Various species of hickory, the chest ack walnut, sweet gum, cucumber tree, cottonwood (*Populus s*), red cedar, elms, holly, magnolias, maples, ash, persim ycamore, tupelo, and many others valuable for their timber, ndant and of large size. The long-leaved pine (*P. australis*) the principal forest growth south of lat. 32° 15'. It attains meter of 2 or 3 feet, has a tall and shapely trunk, and its is unsurpassed in the variety of its uses. The census reports te the merchantable timber of this species now standing in ate at 18,200,000,000 feet, board measure. The amount cut 0 was 108,000,000 feet. The short-leaved pine (*P. mitis*), as valuable, is found in various parts, the quantity now ng being estimated at 6,775,000,000 feet. The total val pine timber of the State is about $250,000,000.

riculture is the leading industry in Mississippi. Over 0 of the population are directly engaged in the cultivation of 000 acres of land. The character of the soil is varied, and productive, except that in the Flatwoods region and in the t covered with long-leaved pine, where only the valleys are At least half the State is exceptionally fertile. Not more one-fourth of the arable land has been brought into culti- , and two millions of acres of the best lands in the State, in the Bottom, might be made arable by proper drainage.

ton is the chief agricultural product; in 1880 Mississippi d first among the States in the amount raised. The crop of 1879-80 amounted to 955,808 bales, worth $43,000,000. were produced also of cotton seed 28,000,000 bushels, $3,000,000; of Indian corn, 21,340,800 bushels; of oats, 1,9 bushels; of wheat, 218,890 bushels; of rice, 1,718,950 lb. quantities of rye, barley, molasses, and tobacco, and abundan of potatoes, yams, pease, and all garden vegetables, are a produced.

Fruits of various kinds flourish in many parts of the Stat with early vegetables, are largely shipped to the northern m in spring and early summer. The value of the cotton about three times as great as that of all the other prod the soil, which are sometimes insufficient for home consum Economically this specialization of agriculture is to be reg but successful efforts are being made to diversify it by g other crops to which the soil and climate are equally well su

Manufactures.—The principal articles manufactured are l cotton and woollen goods, cotton seed oil, and agricultural ments.

Population.—The number of inhabitants at each census to th date to return in 1880 is given in the following table:

				Per cent. of Increase.
	791,711		1,131,597	17
	829,209	484,549	441,069	17
	1,131,597	479,071	662,241	21

Of the colored population, mostly freedmen and their d ats, 1735 were Indians or half-breeds in 1880, and about mulattoes. The whites own nearly all the farms and oth property. The total property valuation in the State de from $607,324,911 in 1860 to $209,197,345 in 1870, one ac the losses in war and the liberation of the slaves. There h however, a rapid increase in the last decade. The towns State have small populations. In 1880 Vicksburg had 11, habitants, Natchez 7058, and Jackson, the State capital, 5,

Administration.—The three departments, legislative, ex and judiciary, are similar to those of other States. The g and other executive officers are elected for four years. Th latures, which meets biennially, is composed of forty s serving four years, and one hundred and twenty representa serving two years. These are apportioned to the seve counties according to population, and elected by the peopl judiciary officers, consisting of three justices of the supreme twelve circuit judges, and twelve chancellors, are appointed governor with the consent of the senate. One attorney and twelve district attorneys are elected by the people. Th maintains a public school system, with separate schools for races, costing in 1880 $830,704, besides a State univers other schools of high grade for each of the races.

History.—Mississippi was first visited by Europeans w when the adventurous expedition of De Soto reached its n parts. After the disastrous termination of this expedi other Europeans visited this region until 1673, when Jo Pere Marquette descended the Mississippi to lat. 33°. In Salle and Tonty descended to the mouth of the riv claimed the whole region drained by it for the king of giving it the name Louisiana. In 1699 the first colony the coast of Mississippi, sent from France under I Settlements were made on Ship Island and Cat Island, an the mainland on the eastern side of Biloxi Bay, at Bay St and at Mobile. The colony did not prosper, and in 1712 A Crozet obtained by charter from the king all the com privileges of the lower Mississippi valley. Under his man the colony languished, and in 1717 the king accepted the s of his charter, and granted another with more extended p to the "Western Company," or "Mississippi Scheme," wi Law as director-general, and Bienville as governor of the Under this management the rich alluvial lands on the Mi river began to be occupied; tobacco, rice, and indigo we vated, and African slaves were introduced. Settlements we near the present city of Natchez in 1720. Two years late company becoming bankrupt, much embarrassment in th followed, and troubles also began with the natives. On N the Natchez Indians surprised and murdered al of the white male residents, and made captives of al women and children and negroes. A war followed, resulti destruction of the Natchez tribe. The representatives "Western Company" returned their franchises to the king, the number of colonists and slaves being then about 7,000 two unsuccessful campaigns against the Chickasaw Indian northern part of what is now Mississippi. Bienville wa by the Marquis de Vaudreuil in 1740.

By the treaty of Paris, in 1763, France ceded all her po east of the Mississippi river to England, excepting the New Orleans, ceded to Spain. The British province

Florida at first extended west and from the Mississippi river along the Gulf coast, with a northern limit at the 31st parallel of north latitude. Soon afterward its northern boundary was fixed at a line drawn eastward from the point where the Yazoo river unites with the Mississippi.

Under Peter Lamb the Natchez country, which had been deserted since the revolt of 1729, and the southern part of the present State of Mississippi rapidly filled with settlers, many of them emigrants from the Atlantic colonies. Cotton, indigo, and sugar were cultivated, and negro slaves continued to be freely introduced. During the revolutionary war of the Atlantic colonies, West Florida was successively wrested and ceded until 1779. Spain and England being then at war, Galvez, the governor of New Orleans, declared his sympathies with the revolutionary colonists, took possession of the whole of West Florida for the king of Spain. At the peace of 1783 England acknowledged the 31st parallel as the southern boundary of the United States, and ceded West Florida to Spain. The district between the 31st parallel and the parallel 32° 28' on the mouth of the Yazoo was therefore claimed by the United States and by Spain, the latter being in possession. After fruitless negotiations the latter power relinquished the district in March 1798, and Congress at once formed it into "the Mississippi Territory," which extended from the Mississippi river eastward between the two above-mentioned parallels of latitude to the Chattahoochee river.

The State of Georgia claimed as a part of its domain all of the district east of the Mississippi river and between the 31st and 35th parallels. In 1802 it ceded its claim to the Federal Government for certain considerations, and in 1804 Congress extended the limits of the Mississippi Territory northward to the 35th parallel. Nearly all of the Territory was then owned by the native Indians. The Choctaws occupied the southern part, and the Chickasaws the northern part of what is now the State of Mississippi. In 1812 the United States troops occupied Spanish West Florida, and the district east of Pearl river and south of lat. 31° was added to the Mississippi Territory. The latter was divided by the present line between Alabama and Mississippi, and the State of Mississippi admitted into the Union in 1817. In 1830–32 the native tribes exchanged their land for others west of the Mississippi river, and were nearly all removed, and a rapid influx of settlers followed. In January 1861 the State seceded from the Federal Union, and joined the Southern Confederacy, furnishing a large number of troops during the civil war. It was the field of many important campaigns, and suffered great loss. Exhausted by the conflict, and harassed by processes of political reconstruction, the State was in a deplorable condition for several years. But within the last decade an era of prosperity commenced, marked by a large increase in population and great activity in agriculture and other pursuits.

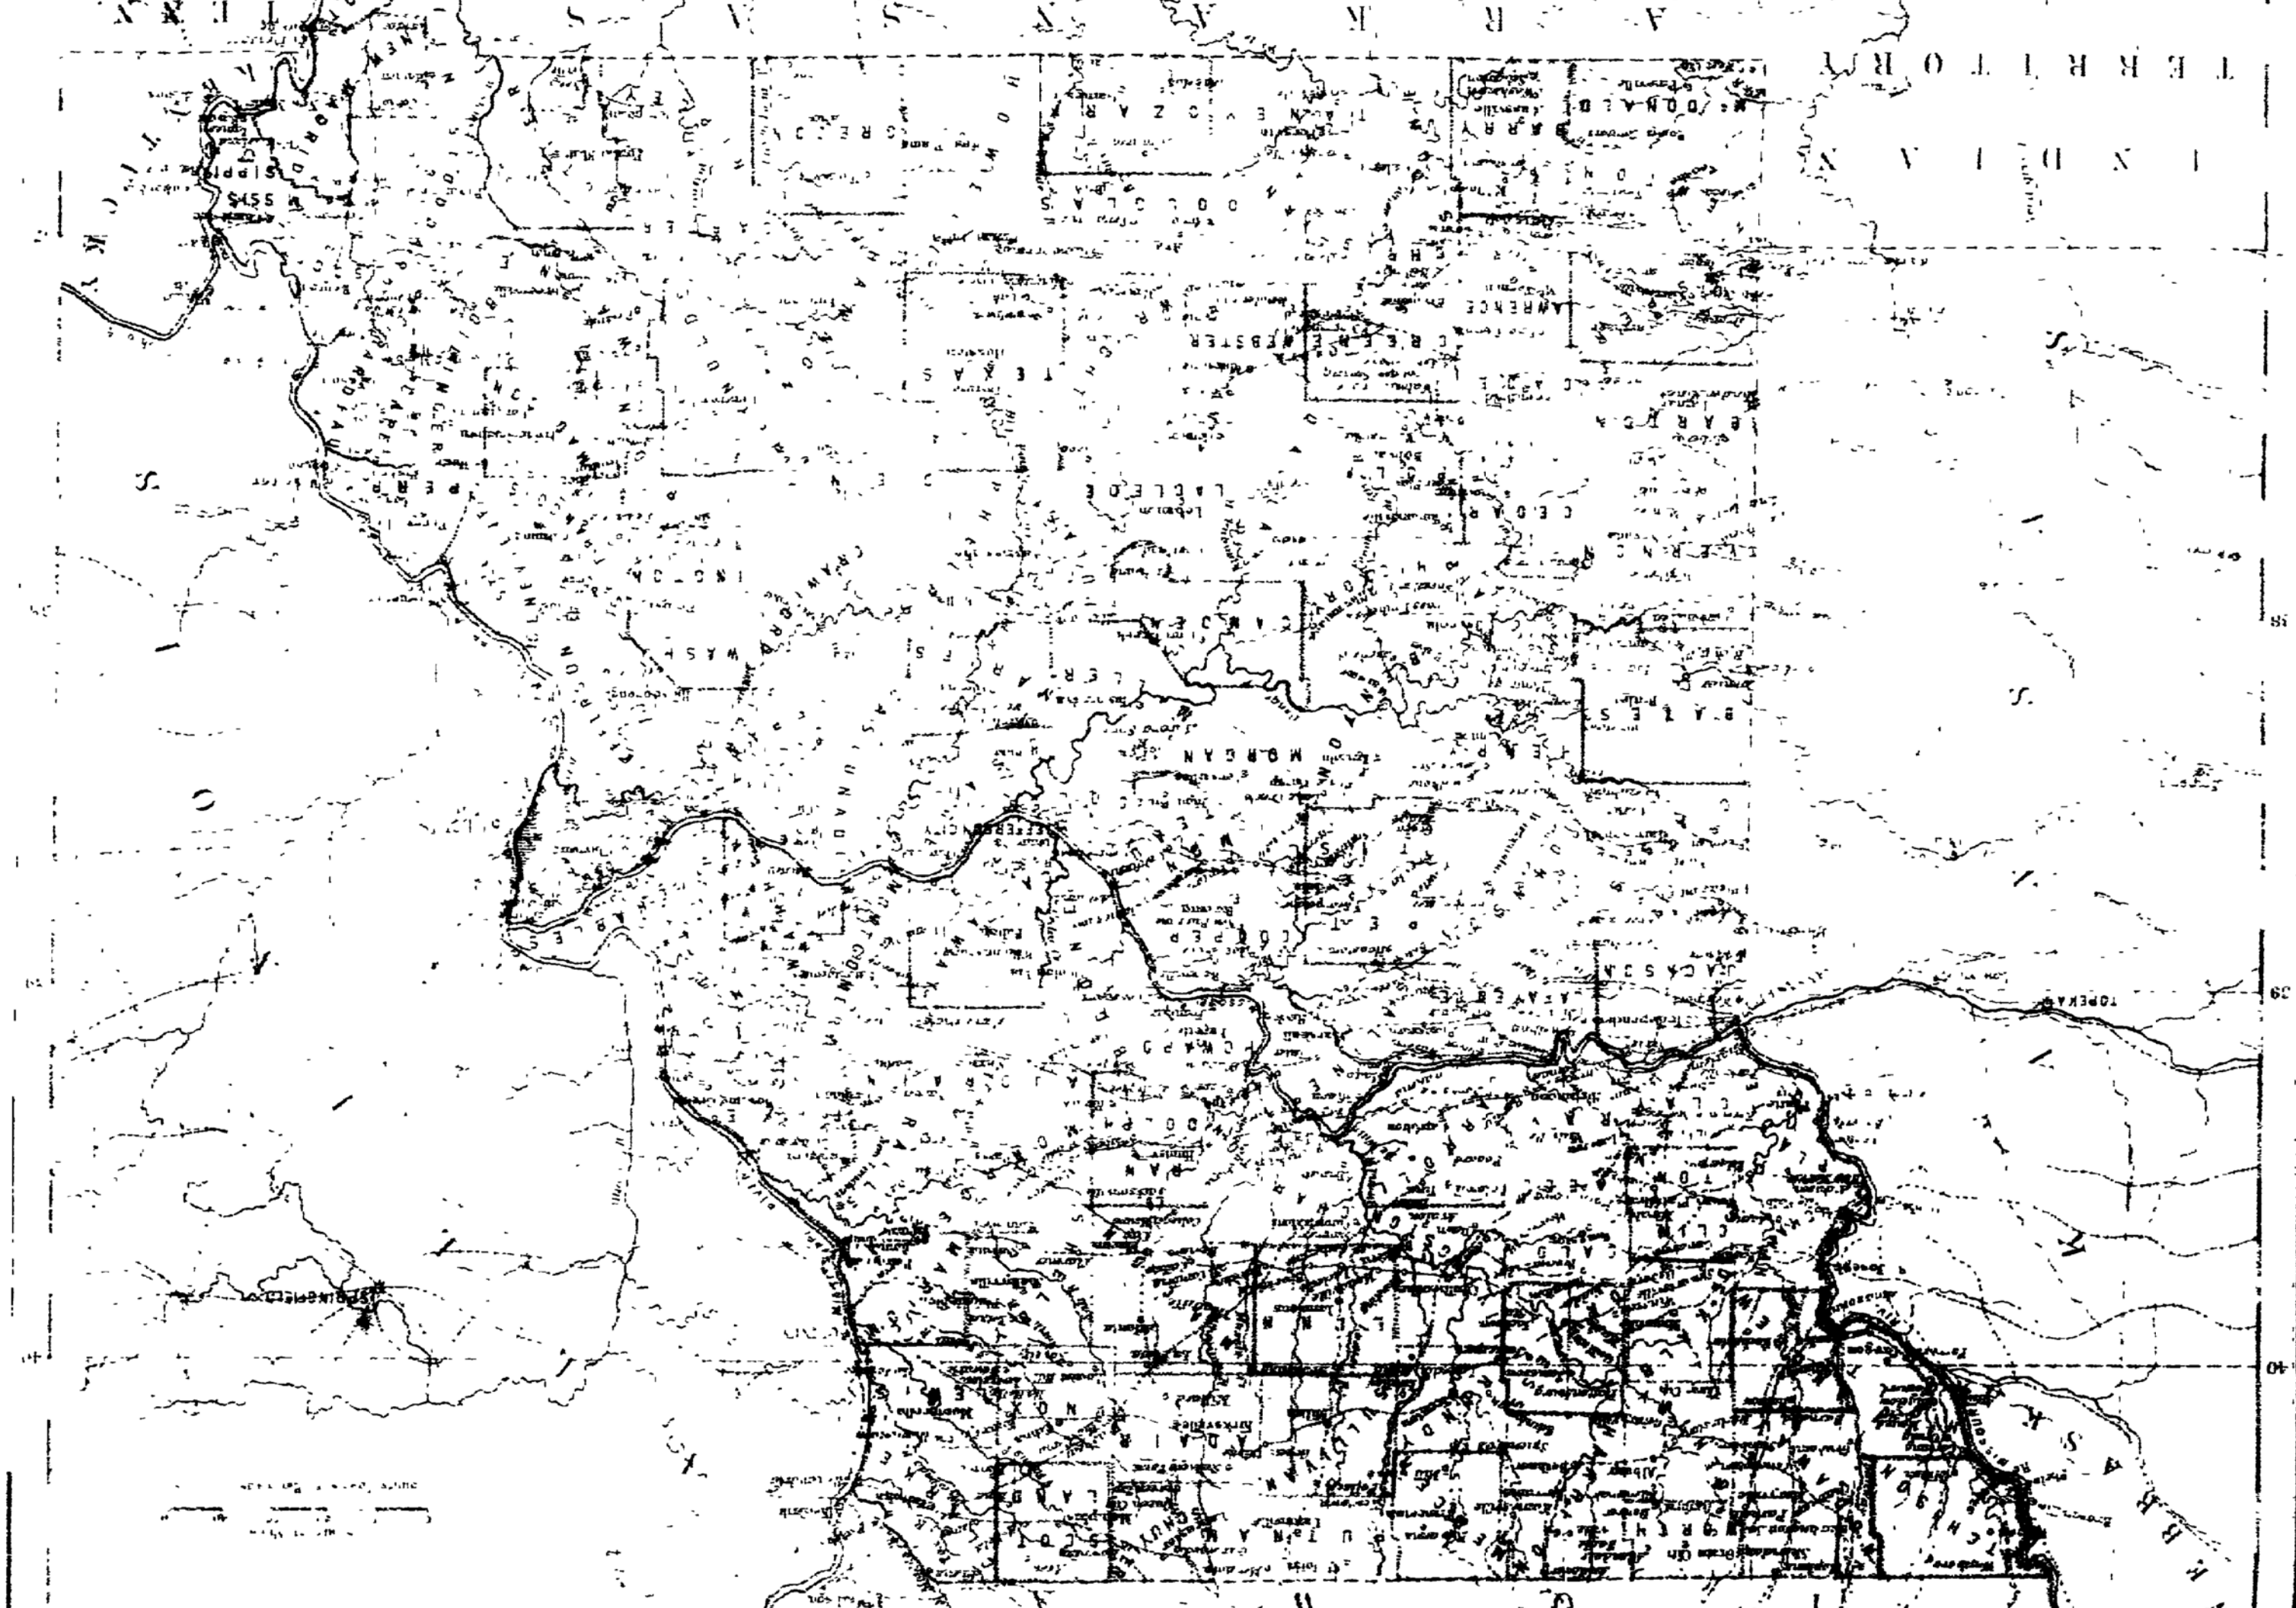
MISSOLONGHI, or MESOLONGHI (Μεσολόγγιον), a city of Greece, the chief town of the nomarchy of Acarnania and Ætolia, situated on the north side of the Gulf of Patras, about 7 miles from the coast, in the midst of a shallow lagoon, with a population of 6321 in 1879. It is noted for the siege of two months which Mavrocordato with a handful of men sustained in 1821 against a Turkish army 15,000 strong, and for the more famous defence of 1825–26 (see vol. xi. p. 125). Byron died there in 1824, and is commemorated by a cenotaph.

MISSOURI, a Central State of the American Union, lying almost midway between the Atlantic and the Rocky Mountains, North America, and the Gulf of Mexico. Its eastern boundary is the Mississippi, separating it from Illinois, Kentucky, and Tennessee. North and south its boundaries with Iowa and Arkansas respectively are mainly coincident with the parallels of 40° 30' and 36° 30' N. lat., but a small peninsula between the Mississippi and St Francois rivers stretches 31 miles farther south between Arkansas and Tennessee. The western border, with Nebraska, Kansas, and the Indian Territory, is nearly coincident with the course of the Missouri to the junction of that stream with the Kansas, and then follows the meridian of 17° 10' W. of Washington (94° 43' W. of Greenwich). The area of the State is 65,350 square miles, the extreme length from north to south 282 miles, the extreme width 348 miles. Missouri is divided into a northern and southern portion by the Missouri, flowing 100 miles in a generally easterly direction its junction with the Kansas to the point 12 miles St Louis where it unites with the Mississippi. The Missouri has a surface broken and hilly, but not tainous. It is mainly prairie land, well watered by and fit for agriculture, but there is a good deal of m the eastern parts, especially along the bold bluffs two great rivers. Southern Missouri is almost divided between timber land in the east and p the west. In its south western portion rises the ta of the Ozark hill (highest point 1600 feet above The Osage, the Gasconade, and other streams flo ward and eastward into the Missouri. The south lowlands form an undulating country, readily drai ram, with gentle inclines generally running north an occasional abrupt isolated hills, forests of oak, elm, maple, ash, locust, willow, persimmon, pecan, and cherry trees, and in the lowest parts swa morasses. High rocky bluffs extend along the the Mississippi from the mouth of the Meramec Ste Genevieve, rising sometimes precipitously height of 350 feet above the water, and low bott with many lakes and lagoons extend from Ste G to the Arkansas border. The south east corne State is 275 feet above the sea, the north east 60 feet, and the north west corner 1000 feet.

Climate. The climate of Missouri, lying as it from the ocean and unprotected by mountain r one of extreme in heat and cold, moisture and The Ozark range is high enough to influence the locally but not to affect that of the whole Sta mean summer temperature for the ten years ranged from 75° in the north west of the State to the south east, but the thermometer has been know to 101°. The winter temperature averaged 3 the whole State, varying from 28° 5 in the north 39° 5 in the south east. In some winters the ten hardly falls to zero, in others 20° below zero ha registered. The Mississippi at St Louis freezes o in four or five years, but this is partly caused accumulations of floating ice coming down from th The river has closed as early as the first week in D and, again, has remained open until the last February. It is in cold seasons sometimes pass the heaviest teams. The Missouri river is ofte during the whole winter. The mean annual tem of the State varies from 53° to 58°. The clima the whole, dry; for in spite of the abundant rain ally in the spring, evaporation is so rapid that t sphere is rarely overloaded with moisture. Apr driest month. The greatest amount of rain fall south eastern part of the State. An unusual am fair weather, prevailing clearness of sky, general of soil and climate, are chief among the natural ad of this great State.

Geology. The stratified rocks of Missouri belon following divisions: Quaternary, Tertiary, Carbo Devonian, Silurian, and Archæan. The Quaternar comprises the drift, 155 feet thick; the bluff, 200 fe the drift, then the bottom prairie, 35 feet thick the surface the alluvium, 30 feet in thickness. Cl strata of sands, marls, and humus form the alluvial of the two great rivers of the State, and make up a s light, and incomparably rich. Beneath the alluvium the bottom prairie, made up also of sands, clays, a table moulds. This formation is found only in th lands of the Missouri and Mississippi rivers, a abundantly in those of the former. Numerous preserved organic remains are found in the botton



ng the shells found in great quantities in the bluff
nains of the mastodon and many trees and plants.
this formation, resting upon the drift, is the bluff.
sts upon the ridges and river bluffs, and thus is
phically higher, although geologically lower, than
ttom prairie. It is composed chiefly of a grey
s marl, coloured sometimes to a deep brown or red
stains of oxide of iron. This formation extend-
he bluffs of the Missouri from Fort Union to it-
and is found capping those of the Mississippi from
ne to the mouth of the Ohio. It is sometimes 200
ek, at St Joseph it is 140, at Booneville 100, at
is 50, in Marion county only 30 feet. The former
s interesting fossils (*Elephas primigenius*, &c.). The
he lowest of the Quaternary system, appears in the
drift, the boulder formation, made up largely of the
sand metamorphic rocks, with rock from the Palæozoic
upon which the others rest. Large boulders, some
in diameter, are found, usually of granite or meta-
e sandstone, no fossils except a few log in the altered
ave been found in this formation. The Tertiary
ion in Missouri is composed of clay shale, iron
ndstone, and sand, and extends along the bluff and
s of the south-east part of the State. Iron ores
in this formation in great abundance, and of the
ality for glass-making and clay for pottery and
are also abound. Below the Tertiary bed are found
which strongly resemble Cretaceous bed found in
places in the United States. These strata are in such
of irregularity and disturbance as to indicate the
nce of some great movements after their deposition
ore the formation of the Tertiary strata. The Upper
iferous system, or coal measures, made up of sand
limestone, marl, coal, and iron ore, cover an area
than 23,000 square miles in Missouri, occupying
tern and northern portions of the State. The supply
mineral and cannel coal found here would seem to
nigh inexhaustible. In the Lower Carboniferous
e found many varieties of limestone and sand-stone
; these are the Upper Archimedes Limestone, 200
Ferruginous Sandstone, 195 feet; Middle Archimedes
one, 50 feet: St Louis Limestone, 250 feet. The
ian system is represented by limestone in Marion,
Pike, Callaway, Saline, and Ste Genevieve counties,
which occur the Chouteau Limestone, 85 feet,
raphic Limestone, 125 feet, Onondaga Limestone,
et. Of the Upper Silurian series are the following
ions: Lower Helderberg, 350 feet; Niagara Group,
et; Cape Girardeau Limestone, 60 feet. Prominent
the Lower Silurian formations are the Trenton
one, 360 feet; the Black River and Birds Eye
one; and the Magnesian series. The last named
s valuable both in a scientific and an economic sense
ers much of the southern and south eastern portions
State, and in it are found vast deposits of lead,
opper, cobalt, iron ores, and marble. The Archæan
occur below the Silurian deposits, and contain silicious
ner slates in which no fossils are found. The porphyry
of this formation also contain iron ore.

The exposed coal in Missouri include upper, middle and
measures. In the first are about 4 feet of coal, and the area
sure is about 8400 square miles. The middle coal measures
about 7 feet of coal, and cover an exposed area of about
quare miles. The lower measures have no workable seams,
from 18 inches in thickness to 4½ feet, and also some thin
of only a few inches. In 1880 556,504 bushels of bitu-
coal were raised in thirty-five counties of Missouri, the
the pit mouth being $1,060,225. 862,772 were paid in
o 2599 persons. The Missouri coal mines are easily worked.
The iron ores are red hæmatite, red oxide, specular iron,
hæmatite or limonite, and clay ironstone. Manganiferous and
s specular ores occur in the porphyries of the Archæan rocks,
and in the granites. The greatest exposure of specular iron
covered is Iron Mountain, the pure mass or body of iron ore
Analysis shows it to contain from 65 to 69 per cent. of metall
The ore of Shepherd Mountain is not so rich as that of Iron
tain, but is uniform in character, free from sulphur and pho
acid and on the whole superior to any other yet developed in M
Pilot Knob ore gives 53 to 60 per cent. metallic iron, and
deleterious substances. It is fine grained, light brush
colour. The ore of the Scotia iron beds and Iron Rangers are
like in appearance and character, being peculiar boulders m
of red hæmatite. In one of the boulders are cav
which the ore has taken botryoidal form, and upon these pe
stalactitic crystallizations are formed that a gorgeous show of pr
colours is presented. The above are the best deposits of ir

the rich counties in the northern central part of the ordering upon the Missouri river. No State raises so ules, asses, and hogs. The production of cereals in 1880 n, 202,185,723 bushels; wheat, 24,966,627 bushels; rye, u-hels, oats, 20,670,958 bushels; barley, 123,031 bushels; at 57,840 bushels. The production of tobacco for the same , 12,015,647 lb from 15,521 acres, valued at $600,256. arts of this amount was raised in Chariton, Marion, e, Howard Callaway, and Saline counties.

Forests. Red-deer are found in every part of the State, n the thinly-settled and mountainous districts. Venison, n season, is as cheap as good beef in the markets of St Wild turkeys are numerous in the swampy and mountainous and are found in all parts of the State. Prairie chickens, ed grouse, are found in the prairie portion of Missouri and ed in great numbers to Eastern markets. In all parts of are found the quail or Virginia partridge, thousands of which are shipped from the State each season. The s or crows of both species are to be considered a pest. squirrel and the red fox-squirrel are also found in large all over the State. Black bass, perch, catfish, buffalo r, and pike are the leading varieties of native fish.

Industries. In 1880 Missouri had about 20,000 manufacturing establishments, in which a capital of about $125,000,000 was d. The products of these establishments were valued at of $300,000,000. The leading manufacturing counties the city of St Louis are Jackson, Buchanan, St Charles, Franklin, Greene, Cape Girardeau, Platte, Boone, and but more than three-fourths of the manufactures are at St Louis, which is the fourth manufacturing city of n. The chief manufacture is that of flour, which employs 0 mills, and is rapidly increasing. Twenty-four mills made in 1880, 2,112,949 barrels of flour, having a daily outmore than 11,000 barrels. St Louis millers and dealers 880 to Europe and South America 619,103 barrels of flour; e world's fairs at Paris, Vienna, and Philadelphia, Missouri ved the first award. The iron industry, which finds second ance, is yet only in its infancy, and St Louis seems destined of the great centres of iron and steel manufacture. The of iron made in Missouri in 1880, in twenty-two establishploying 3139 hands, was 176,758 tons. St Louis made the 102,051 tons of pig iron, steel, and rolled iron and blooms. ly values of a number of other industries are estimated as meat packing $29,000,000, tanning, $10,000,000, bags ing, $7,000,000, shoes, $6,000,000, coal, $6,000,000; and publishing, $5,000,000, furniture, $5,000,000, car nd waggons, $4,500,000, marble and stone, $4,000,000, et, and lead iron, $4,000,000, agricultural implements, 00. The manufacture of plate glass is carried on derable extent, especially in St Louis. At Crystal City, Mississippi, 30 miles below St Louis, is a very large of land suitable for the manufacture of plate glass, and a been organized and is now in successful operation, apital of $1,000,000.

The extensive commerce of Missouri centres at St tween which city and the ports on the Mississippi and river steamboats are constantly plying. Railroad transin recent years, furnished additional and cheaper for much of the trade which formerly depended upon the trade in cotton especially has been greatly increased since 1870 by the use of railroad transportation, which ent one of the great cotton centres of the United ive cotton presses were built in St Louis in that ceipt of cotton from the more southern States, by ly from 12,261 bales in 1869–70 to 157,563 bales in Iron connections have made the interior portions of Texas more accessible to St Louis than to the ew Orleans merchant, and the trade with the south-west ern Mexico is constantly increasing. In 1875 ade by Act of Congress a port of entry to which ould be brought in bond. The value of the ports ending 30th June 1882 was $1,933,312.

Missouri is divided into 114 counties. The following number of inhabitants since 1850:

			Density per square mile
		682,044	11·37
50	682,291	1,182,012	18·08
0	896,314	1,721,295	26·31
0	1,147,187	2,168,380	33·15

50 the foreign born residents numbered 211,578, or 9·7 per whom 109,974 were Germans and Scandinavians, there 145,046 of African descent. The early settlers of the State were French, and their descendants are still found in St Louis a Ste Genevieve and a few other smaller towns. Many Germans ha recently settled in all parts of the State, while English, Irish, Scot and Swedes have also made Missouri their home in considera numbers. The native American population is mostly descend from immigrants from the States of Kentucky, Tennessee, No Carolina, and Virginia. During recent years there has been a la accession to the population from the eastern and north-west States.

St Louis, the chief city of the Mississippi valley, situa upon the Mississippi river about 12 miles below the mouth of Missouri, has a population of 350,518; Kansas City, a thriv town on the western border, situated on the banks of the Missou has 55,785; St Joseph, in the north-west, has 32,431; Hannib in the north-east, has 11,074; and Jefferson City (the State capita in the centre, has 5971.

Education. Missouri has a public school system of educat first adopted in 1839. There are district schools, elementary a ungraded; city schools, graded, with high school courses; f normal schools and a State university. Free public schools white and coloured children between the ages of six and twe years are required by law for every district in the State. Besi these public institutions supported by the State there are ma private schools and colleges for both sexes. Chief among these the St Louis University, an institution managed by the Jesu the College of Christian Brothers, also under the control of Roman Catholics, and Washington University, a non-sectarian dowed school, whose property estimated at $1,000,000, more than 1500 students. The Baptists have a college at Libe called William Jewell College, the Congregationalists one at Spri field called Drury College, and the Methodists and Presbyteri several colleges and seminaries.

Religion. The early settlers of Missouri were Roman Cathol and in the river towns may be found to-day a large number of t faith. The Baptists have 88,999 members, with 1385 church the Methodists, 96,270 members and 913 churches; the Protest Episcopal Church, 25,000 members and 65 church buildings; Presbyterians, with their various branches, 34,628 members and churches.

Administration. The legislative power is vested in a body c sisting of a senate and a house of representatives, which me once in every two years, on the Wednesday after the first day January next after the election of the members thereof. Memb of the legislature receive a sum not to exceed $5 a day for first seventy days of the session, and after that not to exceed $ day for the remainder of the session. They are also allowed m age. The executive department consists of a governor, a l tenant-governor, a secretary of state, a State auditor, St treasurer, an attorney-general, and a superintendent of pu instruction; these are all elected by the people. The supre executive power is vested in the governor, who is chosen for years, and also are the other members of this department. governor has a qualified veto upon the acts of the legislature, such other powers as are common to that officer in the sev States. The judicial power of the State is lodged in a supre court, the St Louis court of appeals, circuit courts, crimi courts, probate court, and municipal courts. All judicial offi are elected by the people. Judges of the supreme court are elec for ten years, those of the St Louis court of appeals for two years, those of the circuit courts for six years. Executive judicial officers are liable to impeachment by the house of re sentatives. All impeachment cases are tried by the senate.

Every male citizen of the United States, and every male per of foreign birth who may have declared his intention to becom citizen of the United States, according to law, not less than one nor more than five years before he offers to vote, who is o the age of twenty-one years, is entitled to vote at all elections the people if he has resided in the State one year immedia preceding the election at which he offers to vote, and has resi in the county, city, or town where he shall offer to vote at l sixty days immediately preceding the election.

History. On the 9th April 1682, the French voyager and explorer La Salle took possession of the country of Louisiana in name of the king of France. Its limits were quite indefinite, and included the present territory of Missouri (see LOUISIANA). The settlements of Missouri were made in Ste Genevieve and at Bourbon, but uncertainty exists as to the exact date. By s the year is fixed at 1763; by others, and by many traditions early as 1735. St Louis was settled by Pierre Laclede Liguest native of France. The site was chosen in 1763, and in Febru 1764 Auguste Chouteau went at the order of Liguest to the previously selected, and built a small village. For a long t the settlements were confined to the neighbourhood of the ri On the 31st of October 1803 the Congress of the United St passed an Act by which the president was authorized to possession of the territory according to the treaty of Paris, and formal transfer of Lower Louisiana was made on 20th Decem

In 1804 Congress divided the territory into two portions. rthern part, commonly called Upper Louisiana, was taken on of in March 1804. In June 1812 Missouri was organ- a Territory, with a governor and general assembly. The overnor (1813-1820) was William Clarke. In 1818 i applied for admission to the Union as a State. Two bitter controversy followed, which convulsed the country eatened the dissolution of the Union. This controversy l a resolution introduced into Congress which had in view slavery restriction upon the admission of Missouri to the This was at last settled by the adoption of the "Missouri mise," which forbade slavery in all that portion of the Louisa chase lying north of 36° 30' except in Missouri, and on ly 1820 Missouri was admitted to the Union. A conven- frame a constitution had already been called, and the ution then adopted remained without material change until The first general assembly under the constitution met in is in September 1820, and Alexander M'Nair was chosen r in August. The seat of government was fixed at St in 1820, and removed to Jefferson City, the present State in 1826. The first census of the State was taken in 1821, e number of inhabitants was found to be 70,617 of whom were slaves. In the Black Hawk war in 1832, the Florida 1837, and the Mexican war in 1846 Missouri volunteer ld their share of the work. In the troubles in Kansas and ter discussion upon the question of slavery, Missouri was nvolved. A strong feeling in favour of secession showed many parts of the State. Governor Jackson, in his al address on the 4th of January 1861, said that Missouri and by the slaveholding States, whatever might be their The election of a majority of Union men, however, a s to a convention called to consider the affairs of the showed that public sentiment was hostile to secession, and nvention adjourned without committing the State to the n party. United States troops were soon gathered at St and forces were also sent to Jefferson City, and to Rolla r Jackson fled from the capital, and summoned all the roops to meet him at Boonville. General Lyon defeated roops, 17th June 1861, and soon most of the State was he control of the United States forces. The State convention reassembled. This body declared vacant the offices of r, lieutenant-governor and secretary of state, and filled y appointment. The seats of the members of the legislature so declared vacant. Governor Jackson soon issued a proclamation declaring the State out of the Union, and Confederate were assembled in large number in the south western part State. General Lyon was killed at the battle of Wilson's ear Springfield, and General Fremont, commanding the ent of the west, decreed martial law throughout the State. ar matters were favourable to the Confederates, and at the of 1862 their troops held nearly half the State; but in y a Federal force under General Curtis drove General Price kansas. He returned in 1864, and overran a large part of te, but was finally forced to retreat, and but little further arose in Missouri during the war. Missouri furnished to ted States army during the war 108,773 troops. In 1865 onstitution was adopted by the people. In 1869 the XV nent to the United States constitution was adopted by a large y. In 1875 still another State constitution was drawn up nvention called for that purpose, and ratified by the people, ow the fundamental law of the State. (M. S. S.)

STLETOE[1] (*Viscum album*, L.), a species of *Viscum*, family *Loranthaceæ*. The whole genus is parasitical, venty-six species have been described; but only the oe proper is a native of Europe. It forms an ever- ush, about 4 feet in length, thickly crowded with) dichotomous branches and opposite leaves. The are about 2 inches long, obovate-lanceolate, yellowish the dioecious flowers, which are small and nearly same colour but yellower, appear in February and ; the fruit, which when ripe is filled with a viscous nsparent pulp (whence birdlime is derived), is always white, but there is said to be a variety with it. The mistletoe is parasitic both on deciduous and en trees and shrubs, and "it would be difficult to say on what dicotyledonous trees it does not (Loudon). In England it is most abundant on the tree, but rarely found on the oak. The fruit is ea most frugivorous birds, and through their agency, p larly that of the thrush (hence missel-thrush or thrush), the plant is propagated. (The Latin prove it that "Turdus malum sibi cacat"; but the sow really effected by the bird wiping its beak, to wh seeds adhere, against the bark of the tree on which alighted.) The growth of the plant is slow, and it bility proportionately great, its death being dete generally by that of the tree on which it has esta itself. See Loudon, *Arboretum et Fruticetum Britan* vol. ii. p. 1021 (1838). The mistletoe so extensive in England at Christmas tide is largely derived fr apple orchards of Normandy.

Pliny (*H. N.*, xvi. 92, 95, xxiv. 6) has a good deal to te the *viscum*, a deadly parasite, though slower in its action t He distinguishes three "genera." "On the fir and lar what is called *elate* in Eubœa and *hyphear* in Arcadia." called *drymos hyphear* is most plentiful on the esculu (quercus), but occurs also on the robur, *Prunus sylvest* terebinth. Hyphear is useful for fattening cattle if they a enough to withstand the purgative effect it produces; a vescum is medicinally of value as an emollient, and in tumours, ulcers, and the like; and he also notes it "con feminarum aduvare commune cum habeant." Pliny's authority for the reverence in which the mistletoe when growing on the robur was held by the Druids. The robur, is their sacred tree, and whatever is found growing upon regard as sent from heaven and as the mark of a tree ch God. Such cases of parasitism are rare, and when the attract much attention (est autem id rarum admodum in repertum magna religione petitur), particularly on the si of the) moon, with which their months and years and, a lapse of thirty years, their "ages" begun. Calling it in th language "all heal" (omnia sanantem), after their sacrif banquet have been duly prepared under the tree, they bi two white bulls whose horns are then for the first time The priest clothed with a white robe ascends the tree, c mistletoe with a golden hook, it is caught in a white They then slay the victims, praying God to prosper His gift unto whom He has given it. Prepared as a draught, it is cure for sterility and a remedy for poisons. The mistleto also in Scandinavian legend as having furnished the ma the arrow with which Baldur (the sun-god) was slain by t god Hoder. Most probably this story had its origin in a p theory as to the meaning of the word mistletoe.

MITAU (the Lettish Jelgava), a town of Russia, of the government of Courland. It is situated 2 by rail to the south west of Riga, on the right bank river Aa, in a fertile plain which rises only 12 feet sea level, and which probably has given it name to th (*Mitte in der Aue*). At high water the plain and son also the town are inundated. Mitau is surrounde canal occupying the place of former fortifications. A canal was dug through the town to provide it with but this now receives the sewage, and water is bro cars from a distance of 3 mile. Though so nea Mitau has quite a different character. It has broad streets, bordered with the low pretty man the German nobility who reside at the capital of C either to enjoy the social amusements for which M renowned or to provide education to their children. is well provided with educational institutions. A nasium occupies a former palace of the dukes of C and has a rich library; and there are about ten schools. The town is also the seat of a society of literature, of a natural history society, which has local museum, and of the Lettish Literary Society. castle of the dukes of Courland, which has witne many conflicts, was destroyed by the Duke Biro erected in its place a spacious palace, now occupied governor and the courts. Mitau has 22,200 inha mainly Germans, but including also Jews (about Letts (5000), and Russians. Manufactures are few

is supposed to have been founded in 1266 by the grand- Count of Mecklenburg. It has often changed its rulers. In on of it was plundered by Lithuanians, it was already an t town. In 1601 it became the residence of the dukes of Prussia the 17th century it was thrice taken by the ians, removed it with Courland in 1795. At the be of the century it was the residence of the count of ahrwald from XVIII. In 1812 it was taken by ch.

ITCHEL, Ormsby Mckinght (1810–1862), American and writer on astronomy, was born in Union county, ky, August 28, 1810. He began life as a clerk, aining an appointment to a cadet-ship at West Point , he graduated there in 1829, and became assistant or of mathematics in 1833. Subsequently he was to the bar, but for ook law to become professor of ics and natural philosophy at Cincinnati college. e established an observatory, of which he became From 1859 to 1861 he was director of the observatory at Albany. He took part in the war nder several of volunteers, and for his skill and in seizing certain important strategic points was l 11, 1862, made major-general. He died of yellow t Beaufort, South Carolina, October 30, 1862. making important improvements on several astrono instruments, Mitchel was the author of several works onomy, the principal of which are *The Planetary ellar Worlds* (1848) and *The Orbs of Heaven* (1851). *mour* by Headley (1865).

CHELL, Sir Thomas Livingstone (1792–1855), an explorer, was a son of Mitchell of Craigend, shire where he was born June 16, 1792. From to the end of the Peninsular War he served in rton's army, and for his services received the medal clasps, and was raised to the rank of major. He pointed to survey the battlefield of the Peninsula, map of the Lower Pyrenees is still admired. In was appointed deputy surveyor-general, and after surveyor-general of New South Wales. He devoted to the exploration of Australia, making four ons for that purpose between 1831 and 1846. these expeditions he discovered the Peel, the the Gwyder, and other rivers, traced the course Darling and Glenelg, and was the first to pene to that portion of the country which he named ia Felix. His first expedition was mainly devoted discovery of a route between Sydney and the Gulf ntaria, and during the journey he explored the Down, and discovered the Balonne, Victoria rd and other streams. In 1838, while in England, ll published the narrative of his first three journeys *Tropical Australia, with the Interior of East Australia* (2). In 1839 he was knighted and made a D.C.L. of During this visit he took with him some of the cement of wool and the first diamond found in the . In 1848 the narrative of his second expedition blished in London, *Journal of an Expedition into rior of Tropical Australia*. In 1851 he was sent rt on the Bathurst gold field, and in 1853 he again England and patented his boomerang propeller for s. He died at his residence at Darling Point, , October 5, 1855.

the above works, Mitchell wrote a book on *Geographical and Descriptive Memoranda*, 1844; an *Introduction to Geography*, and a on of the *Lusiad* of Camoens.

E. Mite (*Acarus*) are minute creatures which large division of the *Arachnida*, distinguished by the absence of any constriction between the cephalo and abdomen. Linnæus included all in the single *Acarus*. They are now divided into several families (containing numerous genera), viz., *Trombidiida* (harvest mites), usually scarlet specks seen running on stones, grass, &c., in hot weather; *Tetranychi*, which, although not bright red, are the red spider of our greenhouses, and are distinguished by feet with knobbed hair; *Bdellidæ*, long-snouted mites with antenniform palpi; *Cheyletidæ* (fig. 1), the so-called book mites, tenacious, predatory little beings, quite uncon nected with book; *Hydrachnidæ*, freshwater mite swimming bees, mostly beautiful creatures of b colours; *Limnesiadæ*, crawling freshwater or mud *Halacaridæ*, chiefly marine; *Gamasidæ*, hard-skinned mites often parasitic on insect, and best known females, and young of both sexes, found on the c during beetle (*Geotrupes stercorarius*); *Ixodidæ*, th ticks, not to be confounded with the sheep tick, &c.

Fig. 1.—*Cheyletus flabe*

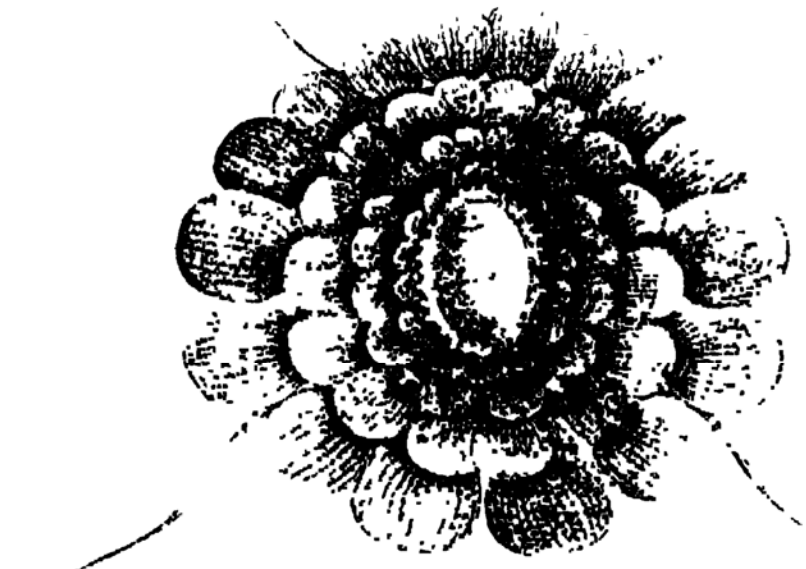

Fig. 2. *Leosoma palmicinctum*, nymph.

are wingless flies; *Oribatidæ*, beetle mites, so calle their resemblance to minute beetles (these are parasitic, they undergo transformations almost as as those of insects, many of the immature forms quaint and beautiful, see fig. 2); *Hydrodromidæ*, bizarr site of the mouse, &c., with peculiar holding *Tyroglyphidæ*, the cheese mites; *Analgidæ*, found feathers of birds; *Sarcoptidæ*, the itch mites; *Arctis* the water bears; *Demodicidæ*, found in the sel follicles of the human nose, &c.; and *Phytoptidæ*, t mites, which attack the leaves of plants, making ti like excrescences.

The sexes are distinct individuals, the reproduc oviparous, the larva is almost always hexapod, thou later stages have eight legs, that answering to the insects is active, and is called the nymph. The br in the first named eleven families is tracheal, the pos the stigmata varying greatly; in the last-named six f it is by the general body surface. No heart or circula the blood is known to exist, the alimentary canal is somewhat on the insect type, but with cæcal prolon to the stomach, the reproductive organs often more crustacean type. There is generally a single ver nerve ganglion above the œsophagus, sending nerve-b to the various parts. The legs have ordinarily

oints, rarely three, the feet are usually terminated
rs or suckers, or both, sometimes by bristles. The
les are generally large, often nest chelate (like a
s claw), sometimes style like piercing organs, and
r forms. The maxillæ vary much: they may be
g or crushing organs, or may coalesce to form a
ry lip; there is usually one pair of maxillary palpi,
ers. Sometimes there is a lingua, and in the
ida a galea. Antennæ are not found.

ats or trees, and is a great pest in greenhouses. It
a slight web on the surface of the leaves, and lives in
nies on the web; it is of a rusty red or brown.
harvest bugs, thought by some writers to be a
, and by them called *Leptus autumnalis*, are simply the
of several species of *Trombidium*. They are predatory,
ll attach themselves temporarily to the human skin,
oduce the violent itching felt on the lower parts of
gs after walking through dry grass in autumn. On
tion with a glass the creature may be seen as a
minute scarlet point. A drop of benzine will probably
rid of the intruder.

The dog tick, like the harvest-bug, is not really par
on mammals, though it attaches itself temporarily
ordinary food may probably be vegetable. (A. D.)

MITFORD, Mary Russell (1786–1855), born at
ford, Hampshire, on the 16th of December 1786,
an honourable place in English literature as the auth
of *Our Village*, a series of sketches of village scen
characters unsurpassed in their kind, and after
century of mutations as true as they had been y
yesterday. Washington Irving was Miss Mitford's
model, but her work is thoroughly original and pecul
the free outflow of a singularly charming character.
short account of her life would be incomplete wit
reference to the scapegrace father who was the ob
her affection, and the Scotch beggar-girl to all that
delightful and characteristic in her writings. Dr. M
first spent his wife's fortune in a few years. Then he
also in a few years the greater part of £20,000 wh
daughter drew on 1797, at the age of forty-two, a pri
lottery, then he lived, for more years, on the
small remnant of his fortune and the proceeds
daughter's literary industry. In the little village of

MITHRADATES, or as it is often written
Mithridates, "given by the god Mithra," a
favourite name of the Pontic kings, in the three
centuries B.C., and was also common in the
neighbouring countries. The dynasty of Pontus
Persian family, claiming descent from the Achæm
and the earliest of them known to history was
under the Persian empire. When that empire was de
Mithradates II. made himself king of Pontus, and
his successors gradually spread their power over

of Cappadocia and Paphlagonia. Several of them rmarried with the Seleucidæ and other Greek royal ilies, and something of the Hellenic civilization was rafted on the native non-Hellenic character of the gdom. The names Mithradates, Pharnaces, and Ariobar- es, all non-Hellenic, alternate in the family. The pro- ce of Phrygia was sold in the most scandalous way by Roman consul Aquillius to Mithradates V., who died bably in 120 B.C. He was succeeded by his son hradates Eupator, sixth of the name, one of those arkable conquerors that arise from time to time in the t. He was a boy when his father died, and for seven lived the wandering life of a hunter pursued by s. His courage, his wonderful bodily strength and , his skill in the use of weapons, in riding, and in the e, his speed of foot, his capacity for eating and drink and at the same time his quick and penetrating llect, his wonderful mastery of twenty-two languages, hese qualities are celebrated by the ancients to a degree ch is almost incredible. With a surface gloss of Greek ation, he united the subtlety, the superstition, and the nate endurance of an Oriental. He was a virtuoso, collected coins, gems, and works of art, he assembled ks, men of letters round him; he gave prizes to the test poets and the best cooks. He spent much of his e in practising magic arts, the interpretation of dreams, other superstitious ceremonies; and it was believed he had so saturated his body with poisons that none ld injure him. He trusted no one: he murdered his rest relations, his mother, his sons, the sister whom he married, to prevent his harem from falling a trophy his enemies, he murdered all his concubines, and his t faithful followers were never safe. He once dis- ared from his palace, no one knew whither, and rned after some months, having wandered over all Asia or in disguise. Except in the pages of romance or the s of the *Thousand and One Nights* it would be difficult nd anything to rival the account given of Mithradates he gravest of historians. These qualities fitted him to e opponent of Roman arms in Asia Minor, to be the mpion of the East in its struggle against the destroying yet crushing power of the West. He resisted the ans for eighteen years, yet we can hardly credit him much real generalship or organizing power. He l collect masses of men and hurl them against the an legions; everything that boundless energy and dless hatred could do he did; but the strength of his tion to the Romans lay in the fact that all the deliber- worst and most cruel time of her war was yet on his side.

collection took place between the Romans and ctor for thirty-two years, though the republic took Bithynia from him in 120 B.C., and several times orted to Sinope in Paphlagonia and Cappadocia ruptures occurred about the time of the Social War hradates encouraged it is said, by envoys from the Italian , to foment disorder in the mainland struggles in Italy. broke out at last on the ostensible cause of disputes t the kingdoms of Bithynia: Mithradates rapidly ran Galatia, Phrygia and Asia, defeated the Roman es, and made a general massacre of the Romans ent in Asia. He despatched large armies into European ce, and his general occupied Athens. But Sulla in ce and Fimbria in Asia defeated his armies in several es, the Greek cities were driven to revolt by his severity, in 84 B.C. he concluded peace, abandoning all his con- s, surrendering seventy ships, and paying a fine of talents. Murena invaded Pontus without any good on in 83, but was defeated in 82. Difficulties con- ly arose between the two adversaries, and in 74 a general war broke out. Mithradates defeated Cott of the Roman consuls, at Chalcedon; but Lucullus w him in several engagements, and drove him finally B.C. to take refuge in Armenia with his son-in-law Tig After two great victories in 69 and 68, Lucullus w concerted by mutiny among his troops and the de his lieutenant Fabius (see vol. xv. p. 56). In 66 superseded by Pompey, who completely defeated Mithradates and Tigranes. The former establishe self in 64 at Panticapaeum, and was planning campaigns against the Romans when his own revolted, and, after vainly trying to poison himse ordered a Gallic mercenary to kill him. So perish greatest enemy that the Romans had to encounter i Minor. His body was sent to Pompey, who buried the royal sepulchre at Sinope.

MITHRAS was a Persian god whose worship over the Roman world during the 2d and 3d cen after Christ. His name is found in the oldest rec the East Aryan races. In the Rig Veda, Mitra, *i.e.* friend, and Varuna, *i.e.*, *Οὐρανός*, are a pair of gods reg associated they denote the heaven of day and the of night. Mithras is therefore by origin the god bright heaven and of day, closely related in concepti and yet expressly distinguished from, the sun. developed Old Persian religion of Zoroaster Mithras re a place, he was not one of the greatest gods, bu first of a triad which, while less pure embodiments divine nature, were more easy for men to comprehen to worships. The seventh month, which bears his nam the sixteenth day of every month were sacred to Mi prayers were offered to him at sunrise, at mid-day at sunset. When the Persians conquered Assyri Babylonia their religion was much affected by the w of these more educated races. The worship of f deities was introduced, that of Persian deities was ch in character, and the gods were represented by i The cultus of Mithras now became far more prominе was identified with the sun, and an elaborate ritua the non-Aryan accompaniment of mysteries was establ This revolution had become before Herodotus (*i.* 131) identify Mithras with the Assyrian goddess Mylitt it became more thorough during the 4th century B.C

It is in this most developed form that we kno cultus of Mithras. The god of light becomes by a translation, which is made in the very oldest Aryan re the god of purity, of moral goodness, of knowledge. goes on in the world as a whole, and in the life o man, a continual struggle between the power of goo the power of evil, Mithras is always engaged in thi test, and his religion teaches all, men and women ali and in the battle. Victory in this battle can be g only by sacrifice and probation, and Mithras is con as always performing the mystic sacrifice through the good will triumph. The human soul, which has separated from the divine nature and has descend earth, can ascend and attain union with God thro process of purification and penance which is taught i mysteries, the sacrifice which is being always offer Mithras makes this ascent and union possible. who were initiated in the mysteries of Mithras had to through a long probation, with scourging, fasting, ordeal by water, and were then admitted as soldiers fig on behalf of Mithras. This was the lowest terre grade, but there were still two others to attain, the and the Lion, each involving further probation, befor soul could rise above the earth. It then ascended t grades of Vulture, Ostrich, and Crow through the r of aether; and then it strove to become pure fire th the grades of Gryphon, of Perses, and of the Sun. F

l attained complete union with the divine nature
the grades of Father Eagle, of Father Falcon, and
ner of Fathers. A holy cave on a hill was the
point in the worship; and the mystic rites involved
g and fasting all night till sunrise brought the
n of light.

worship of Mithras became known to the Romans
the Cilician pirates captured by Pompey about 70
t gained a footing in Rome under Domitian, was
ly established by Trajan about 100 A.D., and by
olus about 190. Finally the mysteries were pro
and the holy cave destroyed in 378. Dedicatory
ions to *Deo Soli Invicto Mithræ*, and votive reliefs
an work, are very common. The usual representa
ows Mithras in the mystic cave performing the
sacrifice; a young man in Oriental costume kneels
e knee on a prostrate bull, grasping the head and
it back with the left hand, while with the right he
s his sword into its neck. A dog, a snake, and a
n drink the blood that flows from the bull's wound
the rock behind Mithras; the figures of the sun
the moon occupy the two sides of the relief.

SCHERLICH, Eilhardt (1794–1863), was born
y 7, 1794, at Neuende near Jever, in the grand-
of Oldenburg, where his father was pastor. He
eated at the gymnasium of Jever under the historian
er. In 1811 he went to Heidelberg, where he
d himself to philology, giving special attention to
sian language. In 1813 he went to Paris, partly
ly, partly with the view of obtaining permission to
French embassy to Persia. The political events of
ut an end to this scheme, and Mitscherlich returned
many. He then set to work on a history of the
es and Kara Chitayens, manuscript materials for
he found in the university library of Göttingen, and
on of which he published in 1815. Still anxious
Persia, he resolved to study medicine in order that
ht enjoy that freedom of travel usually allowed in
st to physicians. He began at Göttingen with the
of chemistry, and this so completely arrested his
on that he gave up the idea of the journey to Persia
e medical profession. In 1818 he went to Berlin,
he worked in the laboratory of Professor Link. He
nalyses of phosphates and phosphites, arseniates and
es, confirming the observations of Berzelius as to
omposition. In the course of these investigations
erved that corresponding phosphates and arseniates
lized in the same form.

was the germ from which grew the theory of
phism. In order to follow out his discovery
erlich set to work to learn crystallography. His
was a fellow student, Gustav Rose, to whose
ting mind and profound knowledge of mineralogy
een due some of the most interesting developments
ustrations of the theory of isomorphism. Having
ed the inclinations of the faces of a vast number of
and artificial crystals, he established the principles
orphism very much as we now hold them.

right that we should remember that Mitscherlich
t the first to notice the fact that two different sub
might have the same crystalline form, or that one
t could partially replace another without great
of form. Romé de l'Isle in 1772 mentions mixed
containing variable proportions of iron and copper,
eblanc in 1802 showed that the crystalline form
s the same although the proportions vary both in
e of these mixed vitriols and in that of mixed
alums. Vauquelin had already, in 1797, prove
alum might contain variable quantities of ammonia w
any corresponding variation of crystalline form.

The authority of Haüy, who laid down as one
principles that each compound has its own crystalline
for a time kept these observations in the backg
Further cases were, however, observed. Wollaston
accurately measured the angles of the rhombo
carbonates, and proved that the forms of these mi
although nearly the same, are not absolutely ide
He showed that a similar close approximation to i
exists in the case of the vitriols. Fuchs in 1815 h
forward his theory of "vicarious constituents."
Laurac proved that a crystal of common alum conti
grow when placed in a solution of ammonia alu
cases of crystallized mixtures were pointed out
French mineralogist Beudant. But notwithstandin
foreshadowings, of which we know, on the evide
Gustav Rose, that Mitscherlich was wholly ignorant
was at the time of which we are now speaking no t
a theory, but merely isolated observations. The th
isomorphism is the work of Mitscherlich. It wa
municated to the Berlin Academy on December 9,

In that year Berzelius paid a visit to Berlin, and
struck with Mitscherlich's ability that he suggested
the minister Altenstein as the most fitting succe
Klaproth in the chair of chemistry in that univers
is not surprising that the idea was not carried o
was only four years since Mitscherlich had begun t
chemistry, he had never lectured, nor had he pu
anything on the subject.

Although Altenstein did not at that time carry
proposal of Berzelius, he was so far impressed by
he obtained for Mitscherlich a Government grant to
him to continue his studies under Berzelius.

In 1820 he went to Stockholm, where he worke
year in Berzelius's laboratory. In 1822 he was app
extraordinary and in 1825 ordinary professor in
In the course of an investigation into the slight diff
discovered by Wollaston in the angles of the rhomb
of the carbonates isomorphous with calc-spar, Mits
observed that the angle in the case of calc-spar vari
the temperature. On extending the inquiry to oth
isotropic crystals he observed a similar variation, a
thus led, in 1825, to the discovery that non-is
crystals, when heated, expand unequally in the direc
dissimilar axes. In the following year he discove
change, produced by change of temperature, in the d
of the optic axes of selenite. The discovery also i
that sulphur can be obtained in two absolutely
crystalline form threw much light on the fact that
minerals calc-spar and aragonite have the same comp
but perfectly different form. Other cases of this p
to which Mitscherlich gave the name of dimorphi
arrived at not long after.

In 1833 he made a series of careful determinat
the vapour-densities of a large number of volatile sub
and proved that Gay Lussac's law as to the prop
by volume in which oxygen, nitrogen, hydroge
chlorine unite with one another hold generally for
elements, and that the simplicity of the relation
volume of the compound to that of the component
also general.

In pure chemistry Mitscherlich's discoveries were
connected with isomorphism. Thus he obtained
acid in 1827, and showed the isomorphism of its sa
the sulphates, and examined with great care the man
and permanganates, showing their isomorphism w
sulphates and with the perchlorates respectively.
did much important work unconnected with this

We may in particular refer to his discovery of ation of benzene to benzoic acid of nitro benzene, a considerable number of the derivatives of benzene. 833 he published his *Lehrbuch der Chemie*, a to a book of chemistry of the most thoroughly d and yet readily scientific kind, from the study of teacher of chemistry may still derive many a Lect He entered in mineralogy led him to the the geology of volcanic regions, and he made to the Ethel with a view to the discovery of of volcanic action He did not, however, publish on the subject, but since his death his notes arranged and published by Dr Roth in the of the Berlin Academy (1860) In December symptoms of heart disease made their appearance, was able to carry on his academical work till 1862 He died at Schonebeck near Berlin on gust 1863

published papers are chiefly to be found in the

VLENE, or Mytilene See Lesbos

PAH (מִצְפֶּה) and Mizpeh (מִצְפֵּה) are Hebrew words place of prospect, or both commanding points s of Palestine usually occupied such positions In the Old Testament we find several places bearing me of "The Mizpah," Mizpeh Sometimes a ming genitive is added "The Mizpeh of Gilead xi 29), "The Mizpeh of Moab" (1 Sam xxii 3). e most famous of these places is that in Gilead noted w Judg x 17) Here Jacob's company was overtaken by the men of Jacob's God and the covenant ended by heaps of stones The narrative of Gen xxxi 45 ff what obscure, and it is not clear from one hand We gather, from it that another name of The Mizpeh was Galeed ed Thus Mizpar Mizpeh, Galeed Gilead Hos v 1 Mizpeh and the height of the pass Josh xviii 26 and Gilead (the height of Gilead) simply The Ramah 2 Kgs xxv 23, 25, are almost proved Enosh to be one pl is it not possible that Ramah Gilead and Mizpeh Gilead may all be nearly identical The place possessed throughout the It was the seat of Gedaliah's government mourning for another probably owing to its being a retreat to ancient ruins almost anarchy the residence of an important official ew Jer xl 6 and a holy or public house on the way Shechem and the house of Obed-edom before Baal-Meon and to which the military revolt of Ishmael son of Nethaniah was carried Mizpah was still a strong place in the Syrian period Josephus Maccabees I Macc iii 46 Jerome knows a place Domus Speculi or Eleutheropolis or Eleutheropolis commonly identified with Tell Sâfi the capital of the Philistines but this cannot be maintained to be made

the prominent bald top of Neby Samwil Mizpeh of the low country of Judah Josh Mizpeh of Moab to be sought under Hermon

EMONICS or contrivances to help the memory, have employed to a more or less systematic form from a arly period Mnemonics (τὰ μνημονικά, ἡ τέχνη μνημονική, Ars Memoriæ) were first cultivated by Greek sophists and philosophers, and are repeatedly referred to by Plato Aristotle In later times the invention was ascribed poet Simonides "perhaps (as Cicero remarks) rather than strength of his memory was fabulous" Cicero, who considerable importance to the art, but more to simplest order as the best help to memory, speaks

Ad Her* III xvi 24 Cicero *De Or* ii 86, mentions this belief commentators (such as

of Carneades (or perhaps Charmades) of Athens and dorus of Scepsis as distinguished examples of the well ordered images to aid the memory. The lat said by Pliny to have carried the art so far *ut nih iisdem verbis redderet auditum*. The Romans value helps as giving facility in public speaking. The n used is described by the author of *Rhet. ad Heren* 24 sqq and by Quintilian (*Inst. Or.*, xi. 1, 2), whose accou however, rather incomplete and obscure. In hi the art had almost ceased to be practised. The Gre Roman system of mnemonics was founded on the mental places and real or pictures The thing to membered was localized in the imagination, and asso with a symbol which concretely represented what desired to retain in the memory, special care being that the symbol should be as vivid, pleasing, and u sive as possible The most usual method was to a large house, of which the apartments, walls, wi statues, furniture &c., were severally associated wit tain name, phrase, event, or ideas, by means of sy pictures And to recall these it was only necessary to over the apartments of the house, till the particular was discovered where they had been deposited by th ination. As the things to be remembered increase houses could be built, each set apart to a certain idea or event, and these houses were again consc into a mnemonic town. In accordance with this s it were desired to fix an historic date in the mem was localized in an imaginary town divided into a number of districts each with ten houses, each hous ten rooms and each room with a hundred quadra memory places partly on the floor, partly on the fou partly on the roof Thus if it were desired to fix memory the date of the invention of printing (14 mercury book, or some other symbol of printing, be placed in the thirty sixth quadrate or memory of the fourth room of the first house of the historic of the town. The success of the method depended on the power of the imagination to give the different rooms, &c., characters the varieties of aspect, and w suppose that it was the effort to frame suitable imag places, invested an adventitious interest to dry detail constituted the real advantage of the system. Exce the rule of mnemonics are referred to by Ma Capella, nothing further is known regarding the p of the art until the 13th century, when the system Romans was revived and a good many treatises published on the subject. Among the voluminou ings of Roger Bacon is a tractate *De Arte Memo* which exists in MS at Oxford. Raymond Lully d special attention to mnemonics in connexion with *generalis* The most important modification of the of the Romans was that invented by Conrad C German poet who, in his *Epitoma in utramque C rhetoricam una cum arte memorativa nova* (1492), inst place made use of the letters of the alphabet. the end of the 15th century Petrus de Ravenna aw such a reputation in Italy by his mnemonic feats was believed by many to be a necromancer. His *Opus Memoriæ*, published at Venice in 1491 in four v went through as many as nine editions, the seventh a me at Cologne in 1608. An impression equally gr produced about the end of the 16th century by L Schenkel, who taught mnemonics in France, Ital Germany, and, although he was denounced as a sorc the university of Louvain, published in 1593 his t *De Memoria* at Douai with the sanction of that cel theological faculty. The most complete account of tem is given in two works by his pupil Martin Somm lished at Venice in 1619. Giordano Bruno, in co

s exposition of the *ars generalis* of Lully, included *ria technica* in his treatise *De Umbris Idearum*.
t the middle of the 17th century Winckelmann made what he called the "most fertile secret" in mne- namely the use of letters with figure- so as to express s by words; and the philosopher Leibnitz adopted abet very similar to that of Winckelmann in con- with his scheme for a form of writing common to all ges. Winckelmann's method was modified and up- ted in regard to many details by Richard Grey, who ed a *Memoria Technica* in 1730. The principal Grey's method is briefly this: "To remember any n history, chronology, geography, &c., a word is , the beginning whereof being the first syllable or s of the thing sought, does, by frequent repetition se draw after it the latter part, which is contrived give the answer. Thus, in history, the Deluge ed in the year before Christ two thousand three d forty-eight; this is signified by the word *Deluk*, nding for Deluge and *tok* for 2348. To retain ng the mnemonical words in the memory they were into memorial lines. The vowels or consonants Grey connected with a particular figure, whereby ily; but in 1806 Feinagle, a monk from Constance, began in Paris to expound a system emonic, one feature of which was to represent the al figures by letters chosen on account of some ity to the figure to be represented or some accidental ion with it. This alphabet was supplemented by licated system of localities, and even with the sam es-ing, by a more vivid and impressive visual char- for want of this are apt to pass from the memory, establishing between ideas of the same group an relation, so that the mention of the one would ing the other. Feinagle, who published a *Nouvelle méthode* at Paris in 1806, came to England in 1811, the following year published *The New Art of y*. A simplified form of Feinagle's method was ed in 1823 by Aimé Paris, and the use of symbolic s was revived in connexion with the latter by a lazwinsky, of whose system an account was pub by J. Bem, under the title *Exposé général de la le Mnémonique Polonaise, perfectionnée à Paris*, Paris. Various other modifications of the systems of gle and Aimé Paris were advocated by subsequent onists, among them being the Phrenotyping or Printing method of Bonnowsky, the Phreno Mnemo of Gouraud, and the Mnemotechnik of Carl Otto. e. The more complicated mnemonic systems have almost into complete disuse; but methods founded on the laws of association have been taught with ncess in Germany by, among others, Kothe, who is thor of *Lehrbuch der Mnemonik*, and *Katechismus dächtnisskunst*, both of which have gone through editions; and in England by Dr Edward Pick, *Memory and the Rational Means of Improving it* so obtained a wide circulation. In certain cases onical devices may be found of considerable service, systems which have aimed at completeness have ound rather to puzzle than aid the memory. The history of mnemonics is that given by J. C. F. von in his *Systematische Anleitung zur Theorie und der Mnemonik*, 1810.

A. See Dysornis

AB. Moab and Ammon (children of Lot) consti long with Edom and Israel (children of Isaac) that of four Hebrew peoples which in early antiquity had from the Syro-Arabian wilderness, and settled on rder of the cultivated country eastward of the great sion which extends from the Gulf of Elath to the Dead Sea, and up the valley of the Jordan. Accord the book of Genesis, they had come out of Mesopo and so were precursors of the larger wave which fo from the same quarter, forming the most southern of the Aramæan immigration into the lands of C and Heth. Whether the Hebrews were originall means is questionable, but it is certain that, b Aramæans, they were distinct from the Canaanite conquerors they were. Such was the relation of and new inhabitants not only in Western Palestin the Israelite occupation, but also and from a much period, in Eastern Palestine, where the aboriginal Amorites (that is, Canaanite) and where the Bne and Moab and the Bne Lot were newly settled i land. The old population did not disappear but conquerors, but continued to exist among them a considerable district, namely, in Gilead, the A even remained unabated, and that formed a gap imperfectly filled up by the Bne Ammon, betwe Hebrew line of migration on the south and th meantime more to the north, a wedge which did no to close until the historical period. From thi they even endeavoured, and with some success afterwards, to recover the territory which ha taken from them in the south. But where they w subject of the Hebrew they constituted the ba population, the man-tool, or the workme and chief. The extent of their influence over the con may be judged from the fact that it was their which gained the upper hand. The Moabite and Ammonite, also the Amorites, spoke the la of Canaan as well as the Israelite. They mus learned it from the Canaanite in the land ea Jordan, prior to the period at which Jacob manag and returned from Egypt. Our knowledge is imperfect as regards other departments of the Ca influence; but in religion it has left a noticeable the cultus of Baal Peor, which was carried on in territory, but was certainly of Canaanite origin.

The assumption that the change of language was brought about by the Israelite in the land which had been that of Canaan rendered intelligible by the fact that the Moabite spoke Canaanitish. But vain to trace accurately the ol Hebrew and Canaanite is the distinction between Phœni Hebrew, no doubt; similar differences existed betw dialect of the Phœnician coast towns and that of the Amorites and Canaanite generally, whose language the borrowed. That the Aramæans of Damascus also allowed pelled to mingle with the Hebrews in the vicinity of wh had taken possession, is probable; but since they spoken by the conquering tribes, they soon lost t direct relation with the mother country of Mesopotamia, a even had greater internal coherence. The designation A usually given in the Old Testament to the original inh of Eastern Palestine, is also extremely uncommon with Canaanite, although not quite so comprehensive. The of the Pre-Israelite peoples which in the Pentateuch is Land of Canaan, figure as Moab in the Land of the A White, however, the former name is bestowed chiefly u portion of the earlier population which had remained unco the latter is given to the portion against which the Israe directed their attack or into whose territory they settled. T place in the mountain district, that to the east and afterwa west of Jordan. For this reason the Amorite, as contra the Canaanites of the coast or of the level country are a race, like the Hebrews themselves, but belonging to an ear past. In the time of the Biblical narrators the Canaanite living here and there in the land, but the Amorite have o where the Israelite now are. This explains the fact that ordinary peaceful circumstances the Canaanites are spoke old inhabitant the Amorite are mentioned as the object whenever war and conquest are spoken of. Sihon and O whom Moses also battles, are kings of the Amorites, in Nu it is with the twelve kings of the Amorite that Joshua ha westward of the Jordan. The Amorite as a race assumes a half-mythical character, and is represented as gi as cedars and strong as oaks.

as Israel was the people of Jehovah, and Ammon
ple of Milcom, Moab was the people of Chemosh
Num. xxi. 29). The kingship of Chemosh was
l as thoroughly national and political in its char-
ut did not on that account exclude the institution
man king which existed in Moab much earlier than
] in the time of Moses the Moabites had a king,
n. titution was even then an old one. The capitals
kingdom were Ar Moab and Kir Moab, south from
en, these were not, however, the constant residences
kings, who continued to live in their native places,
xample, Mesha in Dibon. Doubtless there were
of dynasty, and trace exist of a powerful aristocracy
Moab, 2 Sam. xxiii. 20).

and of the Moabites, the Balka, is bounded north
d southward by Mount Gilead and Wadi l Mu'a,
d and eastward by the Dead Sea and the Wilder-
is divided into two portions by the deep bed of
on, that to the north being the more level (Mishor),
t to the south being more broken up, and consti-
the proper stronghold of the nation. The soil is
ly adapted for sheep farming (2 Kings iii.) and the
of the vine (Isa. xvi.).[1]

ai-torical importance of the Moabites lie wholly in
ontact with Israel, and we have no knowledge of
part from this. After the Israelites had quitted
and passed a nomadic life for about a generation in
ghbourhood of Kadesh, they migrated thence, still
the leader-hip of Moses, into northern Moab, dis-
ing the Amorites, who had made themselves masters
district. The interval from Kadesh to the Arnon
e passed only by a good understanding with Edom,
and Ammon, a proof that the ethnical relationships,
t a later period were expressed only in legend, were
time still living and practical. In all probability
abites called the Israelites to their aid, they were
yet aware that the little pastoral people was des-
ne day to become to them a greater danger than
naanites by whom they were threatened at the
t.[2]

he story of Balaam indicates, the Moabites would
ly have been rid of their enemies after their service
n rendered, but were unable to prevent them from
m the land of Sihon. The migration of the tribes
l into Western Palestine, however, and the dis-olu
their warlike confederation soon afterwards made a
sion of the old frontiers possible. If King Eglon
slate of Benjamin at Jericho, the territory between
and Jordan must also have been subject to him, and
Reuben must even then have lost his land, or at least hi
liberty. It would appear that the Moabites next extende
their attacks to Mount Gilead, giving their support to th
Ammonites, who, during the period of the judges, were it
leading assailants. So close was the connexion betwee
Moab and Ammon that the boundary between them vanishe
for the narrators (Judges xi.).

Gilead was delivered from the Ammonites by Saul, wh
at the same time waged a successful war against Moab; th
fact is lightly touched upon in 1 Sam. xiv. 47, as if thi
were a matter of course. The establishment of the mon
archy necessarily involved Israel in feuds with its neighbour
and kin. The Moabites being the enemies of the Israelit
